VETCH, in botany, the English name for *Vicia sativa*, also known as tare, a leguminous annual herb with trailing or climbing stems, compound leaves with five or six pairs of leaflets, reddish-purple flowers borne singly or in pairs in the leaf-axis, and a silky pod containing four to ten smooth seeds. The wild form, sometimes regarded as a distinct species, *V. angustifolia*, is common in dry soils. There are two races of the cultivated vetch, winter and spring vetches: the former, a hardy form, capable of enduring frost, has smoother, more cylindrical pods with smaller seeds than the summer variety, and gives less bulk of stem and leaves. The spring vetch is a more delicate plant and grows more rapidly and luxuriantly than the winter variety.

The name vetch is applied to other species of the genus *Vicia*. *Vicia orobus*, bitter vetch, and *V. sylvestris*, wood vetch, are British plants. Another British plant, *Hippocrepis*, is known as horseshoe vetch from the fact of its pod breaking into several horseshoe-shaped joints. *Anthyllis vulneraria* is kidney-vetch, a herb with heads of usually yellow flowers, found on dry banks. *Astragalus* is another genus of Leguminosae, and is known as milk-vetch.

Vetches are a very valuable forage crop. Being indigenous to Britain, and not fastidious in regard to soil, they can be cultivated successfully under a great diversity of circumstances, and are well adapted for poor soils. By combining the winter and spring varieties, and making several sowings of each in its season at intervals of two or three weeks, it is practicable to have them fit for use from May till October, and thus to carry out a system of soilings by means of vetches alone. But it is usually more expedient to use them in combination with grass and clover, beginning with the first cutting of the latter in May, taking the winter vetches in June, recurring to the Italian ryegrass or clover as the second cutting is ready, and afterwards bringing the spring vetches into use. Each crop can thus be used when in its best state for cattle food, and so as gratefully to vary their dietary.

Winter Vetches.—There is no botanical difference between winter and spring vetches, and the seeds being identical in appearance, caution is required in purchasing seed to get it of the right sort. Seed grown in England is found the most suitable for sowing in Scotland, as it vegetates more quickly, and produces a more vigorous plant than that which is home-grown. As the great inducement to cultivate this crop is the obtaining of a supply of nutritious green food which shall be ready for use about the 1st of May, so as to fill up the gap which is apt to occur between the roots of the previous autumn and the ordinary summer food, whether for grazing or soiling, it is of the utmost importance to treat it in such a way that it may be ready for use by the time mentioned. To secure this, winter tares should be sown in August if possible, but always as soon as the land can be cleared of the preceding crop. They may yield a good crop though sown in October, but in this case will probably be very little in advance of early-sown spring vetches, and possess little, if any, advantage over them in any respect. The land on which they are sown should be dry and well sheltered, clean and in good heart, and be further enriched by farmyard manure. Not less than 3½ bushels of seed per acre should be sown, to which some think it beneficial to add half a bushel of wheat. Rye is frequently used for this purpose, but it gets reedy in the stems, and is rejected by the stock. Winter beans are better than either. The land having been ploughed rather deeply, and well harrowed, it is found advantageous to deposit the seed in rows, either by a drilling-machine or by ribbing. The latter is the best practice, and the ribs should be at least a foot apart and rather deep, that the roots may be well developed before top-growth takes place. As soon in spring as the state of the land and weather admits of it, the crop should be hoed betwixt the drills, a top-dressing at the rate of 40 bushels of sot of or 2 cwt. of guano per acre applied by sowing broadcast, and the roller then used for the double purpose of smoothing the surface so as to admit of the free use of the scythe and of pressing down the plants which may have been loosened by frost. It is thus by early sowing, thick seeding and liberal manuring that this crop is to be forced to an early and abundant maturity. May and June are the months in which winter vetches are used to advantage. A second growth will be produced from the roots if the crop is allowed to stand; but it is much better practice to plough up the land as the crop is
VETERAN—VETERINARY SCIENCE

cleared, and to sow turnips upon it. After a full crop of vetches, land is usually in a good state for a succeeding crop. When the whole process has been well managed, the gross amount of cattle food yielded by a crop of winter vetches, and the turnip crop by which it is followed, in the same summer, will be found considerably to exceed what could be obtained from the fullest crop of turnips alone, grown on similar soil, and with the same quantity of manure. It is useless to sow this crop where game abounds.

Spring vetches, if sown about the 1st of March, will be ready for use by the 1st of July, when the winter vetches are just cleared off. To obtain the full benefit of this crop, the land on which it is sown must be clean, and to keep it so a much fuller allowance of seed is required than is usually given in Scotland. When the crop is as thick as it should be, the tendrils intertwine, and the ground is covered by a solid mass of herbage, under which no weed can live. To secure this, not less than 4 bushels of seed per acre should be used if sown broadcast, or 3 bushels if in drills. The latter plan, if followed by hoeing, is certainly the best; for if the weeds are kept in check until the crop is fairly established, they have no chance of getting up afterwards. With a thin crop of vetches, on the other hand, the land is so certain to get foul, that they should at once be ploughed down, and something else put in their place. As vetches are in the best state for use when the seeds begin to form in the pods, which takes about three weeks, the crop must be cut by the end of February, or as early in March as the season admits, and continuing till May. The usual practice in Scotland has been to sow vetches on part of the oat break, once ploughed down, and something else put in their place. Sometimes this does very well, but a far better plan is to omit sowing clover and grass seeds on part of the land occupied by wheat or barley after a crop of turnips, and having ploughed that portion in the autumn to occupy it with vetches, putting them instead of "seeds" for one revolution of the course.

When vetches are grown on poor soils, the most profitable way of using them is by folding sheep upon them, a practice very suitable also for clays, upon which a root crop cannot safely be consumed in this way. A different course must, however, be adopted from that followed when turnips are so disposed of. When sheep are turned in upon a piece of tares, a large portion of the food is trodden down and wasted. Cutting the vetches and putting them into racks does not much mend the matter, as much is still pulled out and wasted, and the manure unequally distributed over the land. To avoid those evils, hurdles with vertical spars, between which the sheep can reach with head and neck, are a good innovation. These will keep the vetches up to the growing crop along a considerable stretch, and shifted forward as the sheep eat up what is within their reach. This requires the constant attention of the shepherd, but the labour is repaid by the saving of the food, which being always fresh and clean, does the sheep more good. A modification of this plan is to use the same kind of hurdles, but instead of shifting them as just described, to sow a swathe parallel to them, and fork this forward within reach of the sheep as required, repeating this as often during the day as is found necessary, and at night making the sheep close up to the growing crop, so that they may lie for the next twenty-four hours on the space which has yielded food for the past day. During the night they have such pickings as have been left on the recently mown space and so much of the growing crop as they can get at through the spars. There is less labour by this last mode than the other, and having practised it for many years, we know that it answers well. This folding upon vetches is suitable either for finishing off for market sheep that are in forward condition, or for recently weaned lambs, which, after five or six weeks' folding on this clean, nutritious herbage, are found to take on more rapidly to eat turms and to thrive better upon them, than if they had been kept upon the pastures all the autumn. Sheep folded upon vetches must have water always at command, otherwise they will not prosper.

As spring-sown vetches are in perfection at the season when pastures usually get dry and scanty, a common practice is to cart them on to grass land and spread them out in wipis, to be eaten by the sheep or cattle. It is, however, much better either to have them eaten by sheep where they grow, or to cart them to the homestead.

VETERAN, old, tried, experienced, particularly used of a soldier who has seen much service. The Latin veteranus (vetus, old), as applied to a soldier, had, beside its general application in opposition to ino, recruit, a specific technical meaning in the Roman army. Under the republic the full term of service with the legion was twenty years; those who served this period and gained their discharge (missio) were termed veterani. If they chose to remain in service with the legion, they were then called veterans. Sometimes a special invitation was issued to the veterani to rejoin; they were then styled escos.

The base of Lat. vetus meant a year, as seen in the Gr. έτος (for Ferro) and Sanskrit vata; from the same base comes vitulus, a calf, properly a yearling, vitellus, a young calf, whence O. Fr. veal, modern veau, English "veal," the flesh of the calf. The Teutonic cognate of vitulus is probably seen in Goth. withrus, lamb, English "wether," a castrated ram.

VETERINARY SCIENCE (Lat. veterinarius, an adjective meaning "connected with beasts of burden and draught," from veterus, "pertaining to yearlings," and vitulus, "a calf") is the science, generally, that deals with the conformation and structure of the domesticated animals, especially the horse; their physiology and special racial characteristics; their breeding, feeding and general hygienic management; their pathology, and the preventive and curative, medical and surgical, treatment of the diseases and injuries to which they are exposed; their amelioration and improvement; their relations to the human family with regard to communicable maladies; and the supply of food and other products derived from them for the use of mankind. In this article it is only necessary to deal mainly with veterinary science in its relation with medicine, as other aspects are treated under the headings for the particular animals, &c. In the present edition of the Encyclopædia Britannica the various anatomical articles (see ANATOMY for a list of these) are based on the comparative method, and the anatomy of the lower animals is dealt with there and in the separate articles on the animals.

History.

There is evidence that the Egyptians practised veterinary medicine and surgery in very remote times; but it is not until we turn to the Greeks that we obtain any very definite information with regard to the state of veterinary as well as human medi-7e in antiquity. The writings of Hippocrates (460-377 B.C.) afford evidence of excellent investigations in comparative pathology. Diocles of Carystus, who was nearly a contemporary, was one of the first to occupy himself with anatomy, which he studied in animals. Aristotle, too, wrote on physiology and comparative anatomy, and on the maladies of animals, while many other Greek writers on veterinary medicine are cited or copied from by Varro, Columella and Galen. And we must not overlook Mago of Carthage (300 B.C.), whose work in twenty-eight books was translated into Greek and was largely used by Varro and Columella.

3 Regarding the origin of the word "veterinary," the following occurs in D'Arboval's Dictionnaire de médecine et de chirurgie vétérinaires, edited by Zundel (1877), ii. 814: "Les mots veterinaris et veterinarius étaient employés par les Romains pour désigner: le premier, la médecine des bêtes de somme; le second, pour indiquer celui qui la pratiquait; le mot veterinaire indiquait les bêtes de somme, et était la contraction de veternarius, du verbe verna, porter, tier, trainer. L'étymologie réelle du mot veterinarius, le honne de corps, le mot veterinarius des Romains, et d'après Lenger, encore plus ancienne; elle viendrait du celtique, d'où le mot serait passé chez les Romains; cet auteur fait venir le mot de vee, béétal (d'où l'allemand Vieh), tieren, être malade (d'où l'allemand Zehre, consommation), seris ou arts, artiste, médecin (d'où l'allemand Arzt)."
Until after the conquest of Greece the Romans do not appear to have known much of veterinary medicine. Varro (116–28 B.C.) may be considered the first Roman writer who deals with animal medicine in a scientific spirit in his De Re Rustica, which was published before the birth of Christ. Celsus is supposed to have written on animal medicine, and Columella (1st century) is credited with having utilized those results in his De Re Rustica and was followed in this work by Fannius, who published De Re Rustica, one of the best works of its class of ancient times; it treats not only of medicine and surgery, but also of sanitary measures for the suppression of contagious diseases. From the 3rd century onward many editions and translations appeared in both Greek and regular practitioners, especially in the service of the Roman armies (mulomedici, veterinarii). Perhaps the most renowned veterinarian of the Roman empire was Aspysurus of Bithynia, who in 322 was appointed to a high position in the army and in the hygiene and training of horses. Pelagonius, again, was a writer of empirical tendency, and his treatment of disease in general was most irrational. Publius Vegetius (not to be confounded with Publius Victor) was the author of De Re Rustica, which was the most popular author of the end of the 5th century, though less distinguished than Aspysurus, to whom and to Pelagonius he was to a great extent indebted in the presentation of his veterinary medicine Helveticorum Veterinarum. It appears to have been more of a horse-dealer than a veterinary practitioner, and knew next to nothing of anatomy, which seems to be what we have been lucky at that period. He was an empiricist, and believed in the belief of divine intervention from the bladders through the rectum, coughing for cataract, the extirpation of certain glands, and several serious operations on the horse's foot. Though inferior to several works written by his predecessors, the Mulomedicina of Vegetius maintained its popularity through many centuries. Most of the ancient veterinary writers we know little beyond what can be gathered from the citations and extracts in those books which have been preserved. De Re Rustica of Varro was compiled by order of Constantine Porphyrogenitus in the 10th century.

It is unnecessary to dwell here on the progress of the veterinary art during the middle ages. Towards the close of the medieval period there were several schools of veterinary medicine in Paris, Italy; and Spain also had an organized system of good practitioners in the 15th century, who have left many books still extant. German universities had also a department of veterinary medicine until the end of the 15th century, when in 1492 there was published anonymously at Augsburg a Pfleidererwölkchen. In the following century the influence of the Italian writers was becoming manifest, and the works of Fugger and Fayser mark the commencement of a new era. Fayser's treatises, Von der Gestütrei and Von der Zucht der Kriegs- und Bürger-Pferde (1549–57), are remarkable for originality and good sense. In Great Britain animal medicine was perhaps in a more advanced condition than Germany, for we accept the evidence of the Ancient Laws and Institutes of Wales (London, 1841); yet it was largely made up of the grossest superstitions. The most famous in this country was the horse-dealer and medical practitioner, Felix Aley, whose name has been introduced into many forms of life by being the founder of the Medecines for a Horse and Masclet of Oxen, Horses, Sheepes, Hoggges, Dogges. The word "mascle" shows that the latter work was in its origin a horsemasters' book, that is to say, the representations of the riding masters became popularized, and assumed a concrete form in Blundeville's "Four Chiefest Offices belonging to Horsemanship" (1656), which contains many references to horse diseases, and, though mainly a cavalry work, is yet the chief work of Constantine against the Sick

2 See Fleming, Horse-shoes and Horse-Shoeing (London, 1869).
school was established at Constantinople, and in 1860 the government endowed a school for veterinary surgeons. The universities of Berlin, Hanover and Vienna have been raised to the position of universities.

In 1790 St Bel (whose real name was Vial, St Bel being a village near Vial, his paternal estate), after studying at the Lyons school and teaching both at Allfort and Lyons, came to England and published proposals for founding a school in London for the purpose of training men to pursue veterinary surgery. The Agricultural Society of Oldham, which had been meditating sending two young men to the Altoft school, elected him an honorary member, and delegated a committee to consult with him in the matter. A scheme was proposed whereby the committee detached themselves from the Oldham Society and formed an institution styled the Veterinary College of London, of which St Bel was appointed professor and Dean. The scheme was to be recommenced and the committee sent to London. In March 1791 experiments were made for building temporary stabling for fifty horses and a forge for shoeing at St Pancras. The college made rapid progress in the following year, and soon possession was secured.

As soon as the building was ready for the reception of animal patients, pupils began to be enrolled; and among the earliest were some who afterwards gained celebrity as veterinarians, as Blowes, Blaine, R. Lawrence, Field and Clarke. On the death of St Bel in August 1793 there appears to have been some difficulty in procuring a suitable successor; but at length, on the recommendation of John Hunter and the two men already appointed, Coleman and Moorcroft, the latter then practising as a veterinary surgeon in London. The first taught anatomy and physiology, and Moorcroft, after visiting the French schools, directed the teaching of pathology. The teaching of the veterinary surgeons had these teachers much experience among animals, nor were they well acquainted with their diseases; but Coleman (1765-1839) had as a student, in conjunction with a fellow-student (afterwards Sir Astley Cooper), performed many experiments on animals and directed the direction of Cline. Moorcroft, who remained only a short time at the college, afterwards went to India, and during a journey in 1819 was engaged in the service of the Company. Coleman was appointed a professor of anatomy and energetic management, in a few years raised the college to a high standard of usefulness; under his care the progress of the veterinary art was such as to qualify its practitioners to hold commissions in the army; and he himself was appointed to the medical department general to the British cavalry. In 1831 he was elected a fellow of the Royal Society. Owing to the lack of funds, the teaching at the college must have been very meagre, and had it not been for the lobbying of the political medical men in throwing open the doors of their theatres to its pupils for instruction without fee or reward, their professional knowledge would have been sadly deficient. The board of examiners was for many years chiefly composed of eminent members of the medical profession. Coleman died in 1839, and with him disappeared much of the interest the medical profession of London took in the progress of veterinary medicine. Yet the trustees of the College (with the exception of the president, who continued to do good work in a purely veterinary direction, and received public financial support), were able to show a surplus of £400 per annum, it being the largest sum of money given to it by the government. In the early years of the institution the horse was the only animal to which much attention was given. But at the instigation of the Royal Agricultural Society of London, in 1800, the board of examiners appointed an additional professor to investigate and teach the treatment of the diseases of cattle, sheep and other animals; outbreaks of disease among these were also to be inquired into by the college. This help to the institution was withdrawn in 1875, but renewed and augmented in 1886. For fifteen years the Royal Agricultural Society annually voted a sum of £500 towards the expenses of the department of comparative pathology, but in 1902 this grant was reduced to £200.

As the result of representations made to the senate of the university of London by the governors of the Royal Veterinary College, the school was given the title of University College, Royal Veterinary College (B.Sc.). The possession of this degree does not of itself entitle the holder to practise as a veterinary surgeon, but it was hoped that an increasing number of students would, while studying for the diploma of the Royal College of Veterinary Surgeons, also adopt the curriculum which is necessary to qualify for the university examinations and obtain the degree of bachelor of science. To provide certain further instruction the Board of Agriculture and Fisheries in 1896 made a grant to the college of £500 per annum. At this school post-graduate instruction is given on the principles of bacteriological research, vaccination and anthelmintics. The boards of agriculture of the different states and the bacteriology of the specific diseases of animals.

The London Veterinary School has been the parent of other schools in England, each without separate academic status. In 1904, Professor Dick, a student under Coleman, and a man of great perseverance and ability. Beginning at Edinburgh in 1819–20 with only one student, in three years he gained the patronage and encouragement, were continued to the time of Dick's death in 1860. During the long period in which he presided over the school considerable progress was made in diffusing a sound knowledge of veterinary medicine. As a result of his efforts his examining board, which gave certificates of proficiency under the auspices of the Highland and Agricultural Society, was composed of eminent men of science, and for some time it was the only one in England. Another veterinary school was established in Edinburgh by John Gangle, and the Veterinary College, Glasgow, was founded in 1863 by R. A. G. Moorcroft, Gangle's school was discontinued in 1865; and William Williams' Veterinary College of Scotland, founded in 1869. This school was transferred in 1904 to the University of Liverpool. In 1907 a veterinary school was founded in Dublin.

In 1844 the Royal College of Veterinary Surgeons (to be carefully distinguished from the Royal Veterinary College) obtained its charter of incorporation. The functions of this body were until 1881 limited almost entirely to examining students taught in the veterinary schools, and bestowing diplomas of membership on those who successfully passed the examinations conducted by the boards which in London and Edinburgh were conducted by the Royal College of Veterinary Surgeons obtained its charter of incorporation by a difference arose between the college and Dick, which resulted in the latter sending altogether from the union that had been established. The Royal Veterinary College (which was the independent examining board, the Medical and Agricultural Board of Scotland granting certificates of proficiency to those students who were deemed competent. This schism operated very injuriously on the progress of veterinary education and on professional advancement, as the competition between them was of a rather deteriorating nature. After the death of Dick in 1866, the dualism in veterinary licensing was suppressed and the Royal College of Veterinary Surgeons only by the London College ceased to hold a position inferior to the Royal College of Veterinary Surgeons.

Before beginning their professional studies students of veterinary medicine must pass an examination in general education equivalent in value and respect to that required of students of human medicine. The minimum length of time required for a veterinary degree is three terms each, and during that course four searching examinations must be passed before the student obtains his diploma or licence to practice as a veterinary surgeon. The subjects taught in the schools have been increased in numbers concomitantly with the requirements of ever extending science, and the teaching is more thorough and practical. During the four years' curriculum, besides the preclinical courses, the Royal College of Veterinary Surgeons must study the anatomy and physiology of the domesticated animals, the pathology and bacteriology of the diseases to which these animals are subject, and the physical and chemical processes in the body, and learn to know the results of disease as seen post mortem or in the slaughter-house.

In 1851 an act of parliament was obtained protecting the title of veterinary surgeon in Great Britain from all others, and conferring other advantages, not the least of which is the power granted to the college to remove the names of unworthy members from its register. In so far as respects the Veterinary Surgeons Act is superior to the Medical Act, while it places the profession on the same level as other learned bodies, and prevents the public being misled by empires and imposters.

In 1847 the college conferred a higher degree than membership— that of fellow (F.R.C.V.S.), which can only be obtained after the graduate has been five years in practice, and by enriching a thesis and passing a severe written and oral examination on pathology and bacteriology, and surgery, and on every subject in veterinary science, and medicine. Only fellows can be elected members of the examining boards for the membership and fellowship diplomas. The graduates of the Royal College of Veterinary Surgeons registered from its foundation in 1844 until 1907 numbered about 6000.

In the British army a veterinary service was first instituted at the beginning of the 19th century, when veterinary surgeons with the rank of captain were sent to the hospital in Ranelagh, and to the royal artillery and the royal wagon train. After the Crimean War, and consequent on the abolition of the East India Company medical services, the possessor of a veterinary surgeon's diploma who was employed was increased, and in 1878 they were constituted a "department," with distinctive uniform, instead of being regimental officers as was previously the case. At the same time and by an Act of 1879, the rank of captain was conferred on veterinary surgeons, and the province of the corps was enlarged, so that every one in turn has to serve abroad. In 1903 the officers of the department were given substantive rank, and in 1904 were constituted a "corps," with a small number of non-commissioned officers and men under their command and specially trained by them. In 1897 the Army Veterinary Corps consisted of 176 officers and 220
n-commissioned officers and men. The men are stationed at the veterinary hospitals, Woolwich depot, Aldershot, Bulford and the Curragh, but when trained are available for duty under veterinary officers at any station, and a proportion of them are employed at the same time. Veterinary officers are required to service abroad in rotation, it follows that every officer spends a considerable portion of his service in India, Burma, Egypt or South Africa. The same is true of the five-year period of service abroad is about one-half the total. This offers a wide and varied field for the professional activities of the corps, but naturally entails a corresponding strain on the individuals. Commissions as a general rule are not accepted by examination except by previously qualified as members of the Royal College of Veterinary Surgeons. Promotion to captain and major is granted at five and fifteen years' service respectively, and subsequently, by selection, to lieutenant-colonel and colonel. The director-general has the honorary rank of major-general.

The Indian civil veterinary department was at first recruited from the A.V. Corps, but candidates who qualified as members of the R.C.V.S. were subsequently granted direct appointments by the India Office, by selection. The service is paid and pensioned on the lines of the other Indian civil services, and offers an excellent professional career to those who qualify for it.

In India there are schools for the training of native veterinary surgeons in Bombay, Lahore, Ajmere and Bengal. The courses extend to two or three years, and they are in very limited number. The professors are officers of the Indian civil veterinary department, and graduates are given subordinate appointments in that service, or find ready employment in the native cavalry or in civil life.

In the United States of America, veterinary science made very slow progress until 1884, when the Bureau of Animal Industry was established in connexion with the Department of Agriculture at Washington. The immediate cause of the formation of the bureau was the urgent need by the Federal government of official information concerning the nature and prevalence of animal diseases, and of measures for control and eradication. It deals with the investigation of disease in animals and the management of studs and farms, in addition to the clinical practice which falls to the share of the veterinary surgeon.

In India there are schools for the training of native veterinary surgeons, but the work of the school is not free, and it is not also open to all who are qualified. The places are filled on competitive examination. The professors are officers of the Indian civil veterinary department, and graduates are given subordinate appointments in that service, or find ready employment in the native cavalry or in civil life.

In the United States of America, veterinary science made very slow progress until 1884, when the Bureau of Animal Industry was established in connexion with the Department of Agriculture at Washington. The immediate cause of the formation of the bureau was the urgent need by the Federal government of official information concerning the nature and prevalence of animal diseases, and of measures for control and eradication. It deals with the investigation of disease in animals and the management of studs and farms, in addition to the clinical practice which falls to the share of the veterinary surgeon.

Veterinary science was first taught in the United States of America at the College of Agriculture at Washington, which was founded in 1862, and in 1868 the University of Pennsylvania. The first veterinary colleges were established at the United States Military Academy, at West Point, in 1866, and at the University of Pennsylvania, in 1868. The first veterinary school in the United States was established at the University of Pennsylvania, in 1868, and the first veterinary college was established at the College of Agriculture at Washington, in 1862.

In the Australian commonwealth there is only one veterinary school, which was established in Melbourne, Victoria, in 1888. The Public Health Departments of New South Wales, Western Australia, Tasmania and the other states employ qualified veterinary surgeons as inspectors of live stock, cattle, sheep, and dairy produce.

There is no veterinary school in New Zealand, but the Department of Agriculture has established a veterinary school at Wellington in connexion with the investigation laboratory and farm of the division of veterinary science at Wallaceville. The New Zealand government employs about forty qualified veterinarians as inspectors of live stock, cattle, sheep, meat, wool and dairy produce.

In Egypt a veterinary school with French teachers was founded in 1830 at Abu-Zabel, near Cairo, by Clot-Bey, a doctor of medicine. This school was discontinued in 1852. The Public Health Department of Egypt, which was established in Cairo in 1801, has established a veterinary school for the instruction of natives. Ten qualified veterinary surgeons are employed in the sanitary service of Egypt.

In South Africa, the College of Agriculture at Pretoria, Orange River Colony, Swaziland, Bechuanaland and Rhodesia has a veterinary sanitary police service engaged in dealing with the contagious diseases of animals. Laboratories for the investigation of disease and the preparation of antitoxins and protective sera have been established at Grahamstown, Pretoria and Pietermaritzburg.

**Characteristics of Veterinary Medicine.**

Veterinary medicine has been far less exposed to the vagaries of theoretical doctrines and systems than human medicine. The explanation may perhaps be that the successful practice of this branch of medicine more clearly than in any other depends upon the careful observation of facts and the rational deduction to be made from them. In this respect veterinarians seem, in later times at least, to have been adopted the doctrine of the medical profession in regard to disease and its treatment has been a medical eclecticism, based on practical experience and anatomical-pathological investigation, rarely indeed on philosophical or abstract theories. In this way veterinary science has become pre-eminent a science of observation. At times indeed it has to some extent been influenced by the doctrines which have controlled the practice of human medicine—such as those of Broussais, Hahnemann, Brown, Ross, Rademacher and others—but this has not been for long: experience of them when tested upon dumb unimaginative animals soon exposed their fallacies and compelled their discontinuance.

Of more moment than the cure of disease is its prevention, and this is now considered the most important object in connexion with veterinary science. More especially is this the case with those contagious disorders that depend for their existence and extension upon the presence of an infecting agent, and whose ravages for so many centuries are written largely in the history of civilization. Every advance made in human medicine affects the progress of veterinary science, and the invaluable investigations of Davaine, Pasteur, Chauveux, Lister and Koch have created a new method of combating the diseases of domestic animals. The knowledge which has been gained in this field has been of the greatest importance to agriculture, and has led to the establishment of veterinary science as an independent and distinct branch of science.

The medicine of the lower animals differs from that of man in no particular so much, perhaps, as in the application it makes of utilitarian principles. The life of man is sacred; but in the case of animals, when there are doubts as to complete restoration to health or usefulness, pecuniary considerations generally decide against the adoption of remedial measures. This is a great advantage to the medicine of domesticated animals. It gives more readily to the general principles of treatment, and the procedures of veterinary medicine are comparatively simple and easy to understand.
VETERINARY SCIENCE

Veterinary pathology in the relations it bears to human medicine, to the public health and wealth, as well as to agriculture, has not been sufficiently appreciated; and in consequence but little allowance has been made for the training of veterinarians, which is a necessary part of medical education and which the veterinary practitioner of animal medicine has to contend. The Board of Agriculture and Fisheries has an efficient staff of trained veterinary inspectors, who devote their whole time to the work in connexion with the scheduled diseases of animals, and are frequently employed to inquire into other diseases of animals, the occasional contagious nature of which, when the circumstances are of general importance to agriculturists.

Veterinary science can offer much assistance in the study and prevention of the diseases to which mankind are liable. Some grave maladies of the human species are certainly derived from animals, and others may yet be added to the list. In the training of the physician great benefit would be derived from the study of disease in animals—a fact which has been strangely overlooked in England, as those who can testify who understand how closely the health of man may depend upon the health of the creatures which are the source of his subsistence, and how much more advantageously morbid processes can be studied in animals than in our own species.

Although as yet few chairs of comparative pathology have been established in British universities, on the European continent such chairs are now looked upon as almost indispensable to every university. Bourgelat, towards the middle of the 18th century, in speaking of the veterinary schools he had been instrumental in founding, urged that "leurs portes soient sans cesse ouvertes à ceux qui, chargés par l'état de la médecine, se sont proposés de faire avancer la science, et de multiplier les analogies, et vérifier des idées dont la conformité ne peut être qu'utilé à l'espèce humaine." And the benefits to be mutually derived from this association of the two branches of medicine inspired Vieç d'Azy to elaborate his Nouveau plan de la constitution de la médecine en France, which he presented to the National Assembly in 1790. His fundamental idea was to make veterinary teaching a preliminary (le premier degré) and, as it were, the principle of instruction in human medicine. His proposal went so far as to insist upon a veterinary school being annexed to every medical college established in France. This idea was reproduced in the Rapport sur l'instruction publique which Talleyrand read before the National Assembly in 1796. In this project veterinary teaching was to form part of the National Institution at Paris. The idea was to initiate students of medicine into a knowledge of diseases by observing those of animals. The suffering animal always appears exactly as it is and feels, without the intervention of mind obscuring the symptomatology, the symptoms being really and truly the symptoms of a disease. The benefits were to be derived from the study of animal diseases, which were always in a fresh and forcible state.

The science of Veterinary Medicine is essentially a study of the diseases affecting domestic animals, and of the means of preventing and curing them. It is important to study the diseases of domestic animals because they are a source of human suffering, and because their control and prevention can have a direct effect on human health. Veterinary medicine also plays a crucial role in the management of disease in the food supply chain, ensuring the safety and quality of food for human consumption. Veterinary medicine is a field of study that has evolved over centuries, with early practitioners like Charles C. Le Moyne and later figures like John Bartram, who were instrumental in establishing the discipline. The study of veterinary medicine involves understanding the biology of animal disease, the epidemiology of disease传播, and the development of effective control strategies. This includes the study of animal disease pathogens, their transmission, and the development of vaccines and treatments. The field also involves the study of animal behavior, physiology, and anatomy, as well as the development of diagnostic tools and techniques. The study of veterinary medicine is closely related to the study of human medicine, as many of the same principles apply to both fields. The development of practices like quarantine, the use of disease control measures, and the development of vaccines have been crucial in the advancement of veterinary medicine, and have had a direct impact on human health. The field is constantly evolving, as new technologies and methods are developed to better understand and control animal disease.
operate most freely in restoring health. This can best be rendered in the form of nursing, which sick animals greatly appreciate. However, ever indifferent a horse may be to caressing or kind attentions and when in pain will often apparently endeavour to attract notice and seek relief from those with whom he is familiar. Fresh air and cleanliness, quiet and comfort, should always be secured, if possible. The horse should be kept clean and be allowed to breathe, and be free from draughts. If the weather is cold, and especially if the horse is suffering from inflammation of the air-passages, it may be necessary to keep the oats and barley warm, as carrots can be taken that this does not render the air too dry to breathe. The surface of the body can be kept warm by rugs, and the legs by woollen bandages. Yet a sick horse is easily fattened and made to digest perfectly from giving him a broad, airy resort to artificial heating of the stable than to overload the body or impede movement by heavy wrappings. If blankets are used, it is well to place a cotton or linen sheet under them, should the horse have been sweating; and they should be employed as little as possible, since it hampers movement. Clean old litter, sawdust or peat-moss litter is the best. If the hoofs are strong, and the horse likely to be confined for some weeks, it affords no harm to take off the shoes. Tying up should be avoided, if possible, unless it is urgently required, the horse being allowed to move about or lie down as he may prefer.

Food for a sick horse. When the horse has lost his appetite, he should be tempted to eat by offering him such food as will be enticing to him. It should be given frequently and in small quantities, but should not be forced on him; the food that is not eaten will not be eaten out of the manger. Whether the animal be fed from a bucket or from a manger, any food that is left should be thrown away, and the remainder removed, as the horse may be compelled to eat it. As the signs of sickness a horse requires laxative food, in order to allay fever or inflammatory symptoms, while supporting the strength. The following list comprises the usual laxative foods employed: green grass, green wheat, barley, oats, barley, carrots, parsnips, gruel, bran mash, linseed and bran mash, boiled barley, linseed tea, hay tea and linseed oil. Green grass, lucerne, and similar articles of food if cut when in wet state, should be dried before being boiled. Bran gruel should be cooked with very little water, so that it may be flouiry and comparatively dry when ready; a little salt should be mixed with it. One gallon of good gruel may be made with a pound of barley, which should be boiled white. One day afterwards permitted to simmer over a gentle fire till the fluid is quite thick. To make a bran mash, scald a stable bucket, throw out the water, put in 3 lb. of bran and 1 oz. of salt, add 24 pints of boiling water, stir up well, cover over and allow the mash to stand for fifteen or twenty minutes until it is well cooked. For a bran and linseed mash, boil slowly for two or three hours 1 lb. of linseed, so as to have about a couple of quarts of thick fluid, to which 2 lb. of bran and 1 oz. of salt may be added. The whole should be stirred up, covered over and allowed to steam as before described. The thicker the mash the more readily will be the digestion. The mashes are usually made with barley, but if the horses are very weak or have suffered from a couple of gallons of water until the grains are quite soft. It may be economically made by using less water to cook the linseed, and afterwards making up the quantity desired by boiling and straining. The gruel be prepared by filling a bucket, after scalding it, with good sweet hay, pouring in as much boiling water as the bucket will hold, covering it over, and allowing it to stand under a cover to cool; it is then ready to use. When this form is employed it may be mixed with mixed linseed meal or a little linseed oil. Antiseptic poultices containing lyeol, ial, carbolic acid or creolin, are very useful in the early treatment of foul and punctured wounds. When such poultices are sometimes employed when there is an offensive smell to be got rid of. It is made by mixing linseed meal with boiling water and stirring until a soft mass is produced; with this same wood charcoal in powder is mixed, and when this is applied some more charcoal is sprinkled on the surface. It may be noted that, in lieu of these materials for poultices, spongipoline can be usefully employed. A piece of sufficient size is steeped in a weak solution of applied to the raw wound, covered with oilcloth or water-proof sheeting, and secured by tapes. Even an ordinary sponge, steeped in hot water and covered with waterproof material, makes a good poulticing medium; it is well adapted for the throat, the grooves of the cannon bone and the branches of the lower jaw, as well as for the lower joints of the limbs.

Enemata or douches are given in fevers, constipation, colic, &c., to assist in the对于的 processes. Some ha A strong food solution of potassium chlorate is also administered by a large syringe capable of containing a quart of more, with a nozzle about 12 in. long, or by a large funnel with a long nozzle at a right angle. Water, soap and water or warm water may be used. The nozzle, covered with oil and water proof sheeting, and secured by tapes. Poudrage is a very convenient form of enema. A mixture of ground charcoal and water is also employed. They may be given at any time, except while the horse is breathing, but it should be given in such quantity as the horse can comfortably bear.

Enemata and Douches.
The epizootic diseases affecting the horse are not numerous, and may generally be considered as specific and infectious or contagious in their nature, circumstances of a favourable kind leading to their extension by propagation of the agent upon which they act. While the effect of the maladies, has been proved to be a micro-organism, and there can be little doubt that it is so for all of them.

Glanders (p. 2), or equina, one of the most serious maladies of the equine system. It is a contagious, infectious disease, caused by the bacillus equi (Glanders equi), and specially affects the lungs, respiratory mucous membranes and lymphatic glands of the systemic. The agent of glanders appears to establish itself most easily among horses kept in foul, crowded, badly ventilated stables, or among such as are over-worked, badly fed or debilitated. Glanders, however, may be transmitted to other animals by contiguity and the causative infection is not unlikely to be transmitted by infection of the virus with food or water, or by inoculation of a wound of the skin or a mucous membrane. Carrievous animals—lions, tigers, dogs and cats—may become infected by eating the flesh of glandered horses; and men attending diseased horses are liable to be infected, especially if they have sores on the exposed parts of their bodies. Though in man infection through wounds is the means of receiving the disease, the bacillus may also obtain access through the digestive organs, the lungs and mucous membranes of the eyes, nose and lips.

The maladies of the equine system sometimes a distinction is made between glanders with nasal ulcers and other symptoms of respiratory disease, and glanders of the skin, or, marcis, but there is no essential difference between them. Glanders and marcis are due to the same infective agent, and treatment is the same. Acute glanders is always rapidly fatal, and chronic glanders may become acute or it may terminate by apparent recovery.

The glanders may become more severe with its accompaniments, thirst, loss of appetite, hurried pulse and respiration, emaciation, languor and disinclination to move. Sometimes the legs or joints are swollen and the horse is stiff; but the characteristic symptoms are a greyish-yellow viscid discharge from one or both nostrils, a peculiar enlarged and nodulated condition of one or both submaxillary lymphatic glands, which though they may be painful very for several days, diminish in size when the inflammation subside.

The discharge from the nose adheres to the nostrils and upper lip, and the mouth is often the seat of inflammation, exudation and frequent snorting. The lymphatic vessels of the face are often involved and appear as painful subcutaneous cords passing across the cheek. These vessels sometimes present nodules which break and discharge a glutinous pus. As the disease progresses, the ulcers on the nose increase in number, enlarge or become confluent, extend in depth and sometimes completely perforate the septum. The nasal discharge now more abundant and discharge from the nose and upper lip, is painless, tenacious, yellow, viscous, sometimes crust forms and on some of the swollen parts. Symptoms of congestion of the lungs, or pneumonia and pleurisy, with extreme prostration, diarrhea and gasping respiration, precede death, which is due to asphyxia or apoplexy.

Chronic or latent glanders generally presents few definite symptoms. The suspected animal may have a discharge from the nose, or an enlarged submaxillary gland, or both, and small unbroken nodules may exist on the septum, but usually there is no visible ulceration of the nasal membrane. In some horses suspicion of glanders may be excited by lameness and sudden swelling of a joint, by profuse staling, sluggishness, loss of condition and general unthriftiness, or by refusal of food, rise of temperature, swollen fetlocks, with dry hacking cough, nasal catarrh and other symptoms of a common cold. In these cases, if the nasal discharge continues, the submaxillary gland enlarge, and, after an interval, ulcers appear in the nose or "farcy buds" form on a swollen leg. In occult glanders the horse may appear to be in good health and be able to perform ordinary work. In these cases the existence of glanders can only be discovered by reserving to inoculation or the mallein test.

In cutaneous glanders, or marcis, symptoms occur on the skin of a glanded horse, or on the body, where the lymphatics become inflamed and ulcerated. The limb is much swollen, and the animal moves with pain and difficulty. The lymphatic vessels appear small, dark, "cordons" or "corduroys" form, and along their course arise nodular swellings—the so-called "farcy buds." These small abscesses break and discharge a yellow, glutinous, blood-stained pus, leaving sores which heal very slowly; the discharge is frequently coated with a greenish white membrane.

Medical treatment of glanders or marcis should not be attempted. The disease is dealt with under the Contagious Diseases (Animals) Act—horses which present spasmodic symptoms, or those which have been in contact, or have stood in the same stall with glandered horses, should be isolated and tested with mallein. Animals which are found affected should immediately be destroyed, and their harness, clothing and the utensils employed with them thoroughly disinfected. The slaughtered flesh of horses which the horses have frequented should be disinfected. Forage left by glandered horses should be burned or fed to cattle.

Malenie, which is almost indispensable in the diagnosis of glanders, is by far the best, and is the option of every veterinary surgeon, and the first complete demonstration of its diagnostic value was given in 1891 by Kalning, also of Russia. In brief, preparatory to the diagnosis of glanders in animals, is the sterilization of the filter-paper, the tip of which is placed on the nose of the horse. The horse is not permitted to eat, drink or breathe for a period of 12 hours, when a filter-paper is placed on his nose, and the horse is submitted to test. The first results of the test are seen in about 10 days, and the horse is declared glandered if a small abscess is formed on the filter-paper, which is afterwards examined under a microscope. If the horse is not glandered, then the infection will not cause an abscess, and the horse is declared healthy.

In Epizootic lymphangitis is a contagious eruptive disease of the horse caused by the cryptococcus farcinominus, and characterized by nodular swellings and suppuration of the superficial lymphatic glands. It is a highly contagious disease, and may be artificially transmitted by inoculation or immediate contagion. The eruption usually appears on the limbs, but it may occur on the body or on the head and neck. The symptoms closely resemble those of cutaneous glanders or marcis, but the diagnosis is unequivocally confirmed by microscopic examination of the pus discharged from the sores, or by testing the horse with mallein. Glanders and epidotic lymphangitis may coexist in the same animal. It is a scheduled disease in Great Britain, and is liable to be introduced into the country at any time.
other organs. At various times it has prevailed excessively over different parts of the world, more especially during the 18th and 19th centuries. Perhaps one of the most widespread outbreaks recorded in medical literature was the Rinderpest in Great Britain, which radiates from the district in which it first appears. The symptoms have been enumerated as follows: sudden attack, marked by excessive delirium and stupor, with increased body temperature, quick and often difficult respiration, bloodshot eyes, the eyelids swollen and half closed, eyes lustreless, and tears often flowing down the face. There is great disinclination to move; the body becomes rigid and the legs convulsively extended in the track. The appetite is lost and the mouth is hot and dry; the bowels are constipated and the urine scanty and high-coloured; there is always a deep, painful and harassing cough; on auscultation the lungs are found to be filled with crepitations, and the heart sounds are stertorous; and the membrane lining the eyelids and nose assumes a bright pink colour or a dull leaden hue. A white, yellowish or greenish-coloured discharge flows from the nostrils. In a few days from the time of the outbreak the animal may become torpid, tension and tenderness of the abdominal walls when pressed upon, manifestations of colic, great thirst, a coated tongue, yellowness of the membranes of nose and eyes, high-coloured urine, constipation, and nausea and vomiting. Some of the animals show a peculiar swelling and tenderness takes place in the muscles and joints of the limbs, which may persist for a long time, often shifting from leg to leg, which shows repeatedly acute inflammation of the eyes supervenes, or even paralysis. In this disease good nursing is the chief factor in the treatment. Comfortable, clean and airy stables or loose-boxes should be provided, and the warmth of the body and limbs, and, if possible, a turf bed, to which the animal may be invited, in order that it may have the necessary to adopt such medical measures as the following. For constipation administer enemata of warm water or give a dose of liniment or a mixture of castor oil or milk; for excessive diuresis (as liquor of acetic acid or spirit of nitrous ether), and, if there is cough or nervous excitement, anodyne (such as extract of belladonna). When the fever subsides and the prostration is great, it may be necessary to give stimulating tonics (carbonate of ammonia, nitrous ether, aromatic ammonia) and tonics, both vegetable (gentian, quassia, calumba) and mineral (iron, copper, arsenic). Some veterinary surgeons administer large and frequent doses of atoxyl, and in each country in which it is in use it has shown an excellent effect. If the abdominal organs are chiefly involved, demulcents may supplement the above (linseed boiled to a jelly; to which a small portion of the animals’ fat is added) until the animal is put to rest in a loose box to which the following drugs to allay pain (as opium and chloral hydrate). Olive oil is a safe laxative in such cases. When nervous symptoms are manifested, it may be necessary to apply wet cloths and vinegar to the head and neck, and to give a poultice of mixture of 1:2. Bromide of potassium has been beneficially employed. To combat infiammation of the throat, chest or abdomen, counter-irritants should be given for the period such as anid, to which is a limen or the ordinary white limen composed of oil of turpentine, solution of ammonia and olive oil. The food should be soft mash and gruel of oatmeal, with carrots and green food, and small and frequent quantities of scalded oats in addition when convalescence has been established.

Dourine, maladie du cot, or covering disease of horses, is a contagious malady caused by Trypanosoma equiperdum, and characterized by specific lesions of the male and female genital organs, palpable lymph glands by palpation, fever and vomiting. It occurs in Argentina, and, being closely related to the African, it is easy to fall a victim of the disease. Some cases have been treated with atoxyl with good results. In some cases of this disease the penis becomes enlarged, becomes nodular, and is covered with a glazed appearance, and is often inflamed and inflamed. The urine contains a great deal of pus and blood. The testes are often painful and swollen, and the spleen and liver are enlarged. The disease is usually fatal, and the animal is often weakened and emaciated. It is of great importance to prevent the disease by vaccination.
non-tuberculous animals it has no appreciable action. Medical treatment is of little if any avail. Preventive measures are of the utmost importance. Animals proved free of tuberculous taint should alone be bred from, and those found diseased should be destroyed. The nature of the disease is such that, so long as the food is properly cooked, and the milk from tuberculous cows should be boiled or heated to a temperature of 155° F. (68° C.), and kept in a good state of purity, no harm can follow. A most important point is the disinfection of the premises, which occurs in young stock from a few months to two years old, in various parts of the country, and generally in low-lying damp situations. It was classed with anthrax until the time of Arloing, when it was proved by him that the organism was a different one. A complicated and natural infection takes place through small wounds of the legs and feet or other parts. At first it is a local disease affecting usually a hind quarter, though sometimes the characteristic swellings occur on the shoulders, neck, breast, loins or flank. The chief symptoms are sudden loss of appetite, accelerated pulse and respiration, high temperature, debility, lameness or stiffness, followed by the formation of a small, painful swelling which rapidly increases in extent, becomes emphysematous, and in the centre cold and painless. Incision of the tumour gives escape to a red, frothy, sour-smelling fluid. This disease runs its course very rapidly, and may be arrested sometimes, even cured, by the treatment promptly is applied. Infection can be prevented by resorting to protective inoculation by one of the methods introduced by Arloing, Kitt and others. The natural virus-muscle fractions are used in the introduction of the disease. As the infection is introduced at a high temperature, and a pure culture of the causal organism, are employed as vaccines. The vaccine is introduced subcutaneously at the tip of the tail or behind the shoulder. Immunity lasts for years.

Abortions, or the expulsion of the foetus before viability, is a contagious disease in cows. In a herd a case of abortion or premature birth (from accidents or by disease) appears, but when a number of pregnant females abort the cause of the cases is due to specific infection of the womb. The microbe of abortion induces catarrh of the uterus and the discharge contains the infective anaerobus (enteritis), by irritation of the nerves, or vomiting, or by being associated with a ovarian abscess, catarrhal, or any other disease which has been contaminated by the discharge from an infected cow. Whenever abortion occurs in a cow the milk should be collected from it infected, or if possible, if the cow is aborting, and the infection produced by the organism, the pregnant cow should be quickly removed, with each cow be taken to keep them away from the affected cow and its discharges; the litter and the aborted foetus being burned or otherwise completely destroyed, and the cow thoroughly disinfected with quicklime. To prevent further infection, the hinder parts of the in-calf cows should be washed and disinfected from time to time.

Contagious mammitis is a common disease in milk cows. It has been investigated by Nocard and Mollereau, and proved to be caused by a streptococcus which is transmitted by flies from one gland to another. The microbe gains access to the quarter by the teat and induces catarrhal inflammation of the milk ducts and sinuses, with induration of the glands. This disease develops slowly, and is characterized by suppuration immediately, or after a little or no constitutional disturbance, though sometimes the affected cows lose condition. The milk at first preserves its normal appearance, but is less in quantity; it curdles quickly, is acid, and when mixed with good milk produces clotting; then it becomes thin and watery, and finally viscous, yellowish and foetid. At the base of the teat of the affected quarter induration begins and gradually extends upwards, and if not checked the disease passes from one quarter to another until the whole udder is attacked. Prevention can be secured by washing and disinfecting the udder and teats and the milkers' hands; before and after milking the udders should be isolated, their milk destroyed or boiled and fed to pigs and after each milking the teats should be injected with a warm solution of boric acid or sodium fluoride. Infected cows should be isolated and kept in a different barn.

Parturient paralysis, or mammary toxemia, also known as milk fever, though neither a febrile nor a contagious malady, was until quite recently a very fatal affection of dairy cows. It is caused by a deficiency of calcium in the blood, probably due to the cold weather. The disease commences soon after parturition; and, according to Schmidt, the toxin enters the circulation and affects especially, the central nervous system and in a moderate degree the other body organs. This disease usually attacks good milking cows within a few days of an easy labour and seldom before the third or fourth parturition. In twenty-four to forty-eight hours after calving the cow becomes restless, apprehensive, and不愿 to stand. The hind feet, swells the tail, low, grinds the teeth, staggerers, falls, makes ineffectual attempts to rise, and eventually lies comatose, stretched on the side with the head extended or inclined towards the shoulder. The eyes are dull, injected and insensitive; general sensation, voluntary motion and the power of swallowing are lost. Secretion of milk fails, digestion is suspended, fermentation of the contents of the pouches sets in, with tympany, constipation and retention of urine. The pulse becomes feeble or imperceptible. Respiration becomes laboured and unnatural, and the temperature is low or subnormal. If not treated the animal dies in two or three days from prolonged coma or heart failure.

Black-quarter. This disease is a most lucrative and often highly disastrous, both to the farmer and to the insurance company. It is highly contagious, and used to be very prevalent, though it is very uncommon in the United States at present. It is limited chiefly to the Cattle. In analogy to the disease known as anthrax, it is characterized by a peculiar induration which occurs in young stock from a few months to two years old, in various parts of the country, and generally in low-lying damp situations. It was classed with anthrax until the time of Arloing, when it was proved by him that the organism was a different one. A complicated and natural infection takes place through small wounds of the legs and feet or other parts. At first it is a local disease affecting usually a hind quarter, though sometimes the characteristic swellings occur on the shoulders, neck, breast, loins or flank. The chief symptoms are sudden loss of appetite, accelerated pulse and respiration, high temperature, debility, lameness or stiffness, followed by the formation of a small, painful swelling which rapidly increases in extent, becomes emphysematous, and in the centre cold and painless. Secretion of milk fails, digestion is suspended, fermentation of the contents of the pouches sets in, with tympany, constipation and retention of urine. The pulse becomes feeble or imperceptible. Respiration becomes laboured and unnatural, and the temperature is low or subnormal. If not treated the animal dies in two or three days from prolonged coma or heart failure.
stages as that of cowpox. The mortality may extend from 10% in mild outbreaks to 90% or 95% in very virulent ones. Diseased animals are sheltered, and fed on, non-roughage gruels of oatmeal flour or linseed; acidulated water may be allowed. If there is sloughing of the skin or extensive sores, oxide of zinc ointment should be applied. But treatment should not be attempted while the animal is fresh, as the flesh becomes tough and incoherent. All diseased animals should be destroyed, as well as those which have been in contact with them, and thorough disinfection resorted to.

Foot-rot is a disease of the claws of sheep. It occurs most frequently in badly drained, low-lying, marshy land, and is caused by the Bacillus necrophorus. Infection appears to be spread by contaminated urine. The disease should be avoided by raising the feet somewhat on the horn of affected pastures. The disease begins at the sole or between the claws and gradually extends, causing changes in the bones and tendons, with suppuration, degeneration of horn and sloughing. The foot is因此 reassured with both toenails removed at the coronet; the horn soft and rotten. Affected sheep when feeding may rest on the knees, or if fore and hind feet are involved, they lie down counternipped, and must be cleaned, loose and worn horn removed, abscesses opened, and the foot thoroughly disinfected and protected from further infection by an appropriate bandage. Some cases require daily dressing, and all affected feet should receive frequent attention. When large numbers of sheep are attacked they should be slowly driven through a foot-bath containing an antiseptic solution. Pastures on which foot-rot has been contracted should be avoided, the feet examined even after birth or oftener, and where necessary pared and dressed with pine tar.

Diseases of the Pig.
The pig may become affected with anthrax, foot-and-mouth disease and tuberculosis, and it also has its own particular varieties. But the one most deeply feared is swine fever, which has recently become epidemic in the United States, and is spread preparatory to swine fever to other organs. It is spread with great facility by mediate as well as immediate contagion; the virus can be carried by apparently healthy pigs from an infected piggery, by litter, manure, food, attendants, dogs, cats, vermin, croutes, troughs or anything which has been soiled by the discharges from a diseased pig. It is generally very rapid in its course, death ensuing in a very few hours, and when the animal survives, recovery is protracted. After exposure to infection the animal exhibits signs of illness by dullness, weakness, shivering, bunting itself in the litter, disinclination to move, staggering gait, great thirst, hot dry snout, loss of appetite, blood in the excreted products (105°F). Red and violet patches appear on the skin; there is a hacking cough; nausea is followed by vomiting; diarrhoea ensues; the hind legs become paralysed; stouter sets in, and the animal perishes. Treatment is of no avail and cannot be attempted. Notification of the existence of swine fever is compulsory, and outbreaks are dealt with by the Board of Agriculture and Fisheries. To suppress the disease pigs are all killed, their organs which have been in contact with the wound or deeply burred, being carcasses and litter, and covered with quicklime. Disinfect everything that may have been contaminated with the virus.

Diseases of the Dog.
The contagious diseases of the dog are likewise very few, but the one which attracts most attention is common and generally known as distemper. This is what is popularly known as distemper, trachoma in the medical nomenclature. It is peculiar to the canine species, for there is no evidence that it can be conveyed to other animals, though the different families of Carnivora appear each to be liable to a similar disease. The disease has a specific mode of attack, young dogs being primarily involved in the respiratory passages, though the brain, spinal cord and abdominal organs may subsequently be involved. Highly bred and pet dogs suffer less severely than the commoner and harder kinds. It is a most infectious disease, and there is much evidence to prove that it owes its existence and prevalence solely to its virulence. One attack is sufficient to make the animal immune, and individuals which have recovered from the disease with sneezing, dullness, loss of appetite, desire for warmth, and increased temperature, respiration and pulse. The eyes are red, and the nose, at first dry and harsh, becomes smeared with the discharge which colour becomes green, and at periods renders the animal sleepy. When the animal is older or wiser, the disease begins at the eyes; vision is more or less impaired by the mucus and pus, and often the cornea becomes ulcerated, and even perforated. There is a cough, which in some cases is so violent as to impede respiration. The eyes and nose are frequently more or less discoloured, and the discharge is sometimes blood-stained. The disease in its acute form often affects the intestines, and the dry diarrhea in the majority of cases sets in; the body emits an unpleasant odour; ulceration of the mouth is noticed; the nostrils become obstructed by the discharge from them; con-
colour. The bot remains in the intestine till the following spring, when it detaches itself, passes into the stomach and is discharged with the faeces. When very numerous, bots may cause symptoms of indigestion, acute diarrhoea, abdominal distension, and in the last stages of the disease, the faeces are black and sometimes indicated by any sign of ill-health. They are difficult to dislodge or kill. Green food, iodine, naphthalin, hydrochloric acid and vinegar, when given in large doses, may expel them, but the treatment of choice is a dose of carbon bisulphide given in a gelatin capsule, repeated in twelve hours, and followed twelve hours later by an aloe bath.

Parasites that infest cattle and sheep mention will only be made of Distomum hepaticum, or common fluke, which causes liver-rot or distomiasis, a very fatal disease of lambs and sheep under two years old. It occurs most frequently in the autumn, on both dry and undrained land, but it may be carried to other pastures by sheep which have been driven through a fluke-infested country, and sheep allowed to graze along the roadsides of such pastures. In the pastures of soft soil, a full description of its anatomy and development see TROMATODES. Preventive treatment comprises the destruction of flukes and snails; avoidance of low-lying, wet pastures draining infested land, and top-dressing with salt, lime-salt, or soil; or supplying sheep with pure drinking water; placing rock-salt in the fields, and providing extra food and a tonic rich consisting of salt, aniseed, ferric sulphate, linearse and peas. In ova passages bronchitis of calves is caused by Strongylus micronus, or pointed-tailed strongyle, a thread-worm 1 to 3 in. long and S. pseudochalcothelium, a similar but smaller nematode; and S. vulgaris, or the parasite of S. vulgaris, or the parasite of S. vulgaris, which, in very young calves, is not accurately known. When expelled and deposited in water or moist earth, the embryos may live for many months. Hoses occur in spring and continues until autumn, when it may be most severe. In sheep the symptoms are coughing at first strong, with long intervals, then weak and frequent, leaving the sheep distressed and wheezing; discharge from the nose, salivation, occasional retching with brought up food, diarrhea, and iron-coloured faeces. Ascaris is seldom found. In calves the symptoms are similar but less acute. Various methods of cure have been tried. Remedies given by the mouth are seldom satisfactory. Good results have followed the use of chloride of lime or formalin. Intratracheal injections of chloroform, iodine and ether, oil of turpentine, carbolic acid, and opium tincture, or chloroform, ether, cresote and olive oil. The system should be supported with as much good nourishing food as possible.

The principal parasites that infest the alimentary canal of cattle or sheep are Strongyloides and Taenia. The strongyles of the fourth stomach are S. contortus, or twisted wire-worm (male 10 to 20 mm., female 20 to 30 mm. long), S. equinum (female 10 to 15 mm.), S. cervicalis (female 10 to 15 mm.), S. gravis (female 10 to 4 mm.), and an unknown species (female 10 to 14 mm. long) discovered by MacCallum. These worms may easily be recognized, but the other parasites, owing to their small size or situation in the mucous membrane, may be overlooked in an ordinary post-mortem examination. The red blood being removed, as the blood is the same colour as the mucous membrane. It lives on the blood which it abstracts from the mucous membrane, and, according to the state of repulsion, its body may be red or white. The ova of this worm are 1/20 to 1/25 of a grain in size. The parasites that infest the sheep may be gathered by the ova of Passer domesticus. The ova hatch in a few days, and, according to Ransom, within a fortnight embryos one-thirtieth of an inch long may be found encased in a chitinous investment. They remain in the effects of excessive cold, heat or moisture, and may live in damp and the temperature not too low, the embryos creep up the leaves of grasses and other plants, but when the temperature is below 40°F., they are inactive (Ransom). Sheep feeding on infected pasture gather the young worms and convey them to the fourth stomach, where they attain maturity in two or three weeks. In wet weather the embryos may be washed into ponds and ditches, and cattle and sheep may swallow them when drinking. Strongyles cause loss of appetite, irritation and inflammation of the stomach and bowels, diarrhea, anaemia, progressive emaciation and, if not destroyed or expelled, a lingering death from exhaustion or failure to thrive. The treatment depends on the degree of infestation. A change of pasture is always desirable, and as remedies a few doses of oil of turpentine in linearse oil, a dose of chloroform, or ether, a dose of strong sulphate, or an erecto of olive oil. The ox may be the bearer of three and the sheep of twelve species of tapeworms, and of these the commonest is Moniezia (taenia) expansa, which is also the largest, and is found in the residual of the largest tapeworm, being from 6 to 30 ft. in sheep and from 40 to 100 ft. in cattle. Its maximum breadth is 1/2 in.; it is found in the small intestine, and sometimes in sufficient numbers in lambs or adult sheep to obstruct the bowel. Infected animals are pastured by feeding the rye segments over the pastures, from which the ova or embryos are gathered by the sheep. The symptoms are inappetence, dry harsh wool, weakness, anaemia and diarrhoea with segments of the worms in the faeces. Various drugs have been prescribed for the expulsion of the worms, but with but little success. The best remedy, and the only one that is likely to succeed, is a dose of carbon bisulphide given in a gelatin capsule, repeated in twelve hours, and followed twelve hours later by an aloe bath.

The principal round-worms of the intestine of ruminants are Ascaris vitulorum, or calf ascarid, Strongylus vulgaris, Trichostrongylus axei, T. axei, T. filiformis, T. paradoxus, T. contortus, and T. spiralis. These are all serious to severe symptoms in sheep. For a full account of the development of Cysticercus bovis, or beef malace, the larval form of Taenia saginata of the human subject, see TAPEWORMS. Another bladder-worm, probably the larval stage of a common sheep and cattle, is Cysticercus collis, or slender-necked hydatid, the larval form of Taenia saginata of the dog. It seldom produces serious lesions. An important parasite of domesticated ruminants in Coenurus cerebralis, which reproduces in sheep, cattle, goats and deer gird or sturdy, a peculiar affection of the central nervous system characterized by congestion, compression of the brain, vertigo, inco-ordination, and other symptoms of cerebrospinal paralysis. This bladder worm is the cystic form of Taenia coeneus of the dog.

The infestation of infected cattle by the enzootia of man. Allusion must be made to Trichinella spiralis, which causes trichinosis. The male is 5th, the female 1st in long, and the embryos 4th to 4th in long. The ova mature 5th to 5th in their long diameter; they are hatched in the body of the female worm. When the female is found in the body of the female worm, the ova have been ingested by the pig, the cysts encysted the larval trichinosis are dissolved by the gastric juice in about eighteen hours, and the worms are found free in the intestine. In twenty-four to forty-eight hours these larvae, having undergone certain transformations, become sexual mature; then they are expelled after a short time the enzootia of man. The enzootia of man is the female worm and immediately begin to penetrate the intestinal wall in order to pass into various voluntary muscles, where they remain and mature. The cysts are expelled in the faeces, or begin their wandering. Usually each larva is found in a capsule, but two or even three larvae have been found in one investment. They have been known to live in their capsules for eighteen months to two years.

Cysticercus cellulosae is the larval form of Taenia solium of man (see Taeworms). "Meaty pork" is caused by the presence in the flesh of the pig of this enzootia, which is bladder-infective. It has also been discovered in the dog. Other important parasites of the pig are Stephanurus dentulatus, or crowned-stomach, Echinobothrix gigas, or thorn-headed worm, Ascaris suis, or pig ascarid, and Strongylus edentatus. For these the most useful remedies are castor oil seeds, given with the food, and oil of turpentine in milk, followed by a dose of Epson salts.

Of all the domesticated animals the dog is by far the most frequently infested with worms. A very common round-worm in the dog is Ascaris margarita (3 to 8 in. long), a variety of the ascarid (A. mystax) of the cat. It occurs in the intestine or stomach of young dogs. The symptoms are emaciation, drooping, listlessness, and intestinal troubles, such as infestation of the worms in mucus, colic and diarrhoea. The treatment comprises the administration of arsena or santonin in milk, followed by a dose of castor oil or bitters, and sulphate of copper. Other infestations, such as the heart of the dog, and its larvae may be found in the blood, causing endocarditis, obstruction of the vessels, and fits, which often end in death. Sporocera sanguinolenta may be found in the dog, and is killed by the white or green medicine, which is given in cattle. Other infestations of the dog are Anchylostomum tricuspis, which causes frequent bleeding from the nose and perniacous anaemia, and Trichocephalus depressus. Other round-worms in the dog and cat that are harboured eight species of taeniae and five species of Bothriocephalus. Taenia serrata, about 3 ft. in length, is found in about 10% of
The vegetable parasites, or Dermatophytes, which cause linear or ringworm in horse, cattle, and dogs, belong to the distinct genera: Trichophyton, Microsporum, Eidomella, Achorion, and Oospora. Ringworm of the horse is either a Tricho-
phyton or a Microsporum fungus. The Microsporum species, especially M. equi, parasitize the horse's skin; and its elasticity and break off, leaving a greyish-yellow, bran-like crust of epidemical products, dried blood and sometimes pus. In the horse, the infection may arise entirely from fungi, and have an outline that of a tobacco leaf. It may affect any part of the skin, but occurs principally on the head, face, neck, back and hind quarters. It is very contagious, and it may be transmitted from one species to another, and from animals to man. The affected parts should be carefully scraped and the crusts destroyed by burning; then the patches should be dressed with tincture, solution of copper sulphate or carbolic acid, or with oil of tar. 

VEETO (Lat. for "I forbid"), generally the right of preventing any act, or its actual prohibition; in public law, the constitutional right of the competent authority, or in republics of the whole people in their primary assembly, to protest against a legislative or administrative act, and to prevent wholly, or for the time being, the validation or execution of the same.

It is generally stated that this right was called into existence in the Roman republic by the tribunica potestas, because by this authority decisions of the senate, and of the consuls and other magistrates, could be declared inoperative. Such a statement must, however, be qualified by reference to the facts that interdicto, interdictum were the expressions used, and, in general, that in ancient Rome every holder of a magistracy would check a negative act with a collegial his equal in rank, by his opposition and intervention. This was a consequence of the position that each of the colleagues possessed the whole power of the magistracy, and this right of intervention must have come into existence with the introduction of collegial authorities, i.e. with the commencement of the republic. In the Roman magistracy a twofold power must be distinguished: the positive management of the affairs of the state entrusted to each individual, and the power of restraining the acts of magistrates of equal or inferior rank by his protest. As the tribunus plebis possessed this latter negative competence to a great extent, it is evident that the powers in question were derived from it.

In the former kingdom of Poland the precedent first set in 1632 was established by law as a constant right, that in the imperial diet a single deputy by his protest "Nie pozwalam," i.e. "I do not permit it," could invalidate the decision sanctioned by the other members. The king of France received the right of a suspensory veto at the commencement of the French Revolution, from the National Assembly sitting at Versailles in 1789, with regard to the decrees of the latter, which was only to be valid for the time being against the decisions contested and set on foot by a collegial his equal in rank, by his opposition and intervention. This was a consequence of the position that each of the colleagues possessed the whole power of the magistracy, and this right of intervention must have come into existence with the introduction of collegial authorities, i.e. with the commencement of the republic. In the Roman magistracy a twofold power must be distinguished: the positive management of the affairs of the state entrusted to each individual, and the power of restraining the acts of magistrates of equal or inferior rank by his protest. As the tribunus plebis possessed this latter negative competence to a great extent, it is evident that the powers in question were derived from it.

According to the constitution of the German empire of 1871, the imperial legislation is executed by the federal council and imperial diet; the emperor is not mentioned. In the federal council the simple majority of votes decides. But in the case of bills concerning the army, the navy and certain specially noted taxes, as well as in the case of decisions concerning the alteration of orders for the administration, and arrangements for the execution of the laws of customs and taxes, the proposal of the federal council is only accepted if the Prussian votes are on the side of the majority in favour of the same (art. vii., sect. 3). This was the case of the colonies and the army bill. But the state of things is, therefore, in fact, as follows: it is not the German emperor, but the same monarch as king of Prussia, who has the right of veto against bills and decisions of the federal council, and therefore can prevent the passing of an imperial law. The superior power of the presidential vote obtains, it is true, its influence only in one legislative body, but in reality it has the same effect as the veto of the head of the empire.

The Swiss federal constitution grants the president of the Confederation no superior position at all; neither he nor the other president is elected by the two houses of parliament. He is elected by the two houses of parliament for a period of three years. The state of things is, therefore, in fact, as follows: it is not the German emperor, but the same monarch as king of Prussia, who has the right of veto against bills and decisions of the federal council, and therefore can prevent the passing of an imperial law. The superior power of the presidential vote obtains, it is true, its influence only in one legislative body, but in reality it has the same effect as the veto of the head of the empire.

In the French republic the president has no veto strictly so called, but he has a power somewhat resembling it. He can, when a bill has passed both Chambers, by a message to them, refer it back for further deliberation. The king or queen of England has the right to withhold sanction from a bill passed by both houses of parliament. This royal prerogative has not been exercised since 1692 and may now be considered obsolete. The governor of an English colony with a representative legislature has the power of veto against a bill passed by the legislative body of the colony. In this case the bill is finally lost, just as a bill would be which had been rejected by the colonial council, or as a bill passed by the English houses of parliament would be if the crown were to exert the prerogative of refusing the royal assent. The governor may, however, without refusing his assent, reserve the bill for the consideration of the crown. In that case the bill does not come into force until it has actually or constructively received the royal assent, which is in effect the assent of the English ministry, and therefore indirectly of the imperial parliament. Thus the colonial liberty of legislation must, legally reconcilable with imperial sovereignty, and conflicts between colonial and imperial rights are prevented.

The constitution of the United States of America contains in art. i., sect. 7, par. 2, the following order:

"Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the president of the United States; if he approve, he shall sign it, if not, he shall return it with his objections to that house in which it shall have originated, who shall enter the objections at large on their journal and proceed to reconsider it. If, after such reconsideration, two-thirds of both houses shall agree to pass the bill, it shall be sent, together with the objections, to the other house, by which it shall likewise be reconsidered, and, if approved by two-thirds of that house, it shall become a law. Every order, resolution or vote to which the concurrence of the Senate and House of Representa-

ve

Notes:
Gustavus Vasa. At Alvastra, 16 m. S. again, are ruins of a Cistercian monastery of the 12th century. Close to Motala are some of the largest mechanical workshops in Sweden, building workshops, forges, smithies, bridges, &c.

**VETULONIA**, or **VETULONIA** (Etruscan *Vetuluna*), an ancient town of Etruria, Italy, the site of which is probably occupied by the modern village of Vetulonia, which up to 1889 bore the name of Colonna. It lies 1130 ft. above sea-level, about 10 m. direct N.W. of Grosseto, on the N.E. side of the hills which project from the flat Maremma and form the promontory of Castiglione. The place is little mentioned in ancient literature, though Silius Italicus tells us that it was hence that the Romans took their magistral insignia (fasces, curule chair, purple toga and brazen truncheons), and it was undoubtedly one of the twelve cities of Etruria. Its site was not identified before 1864, and the identification has been denied in various works by C. Dotto da Dei, who places it on the Poggio Castiglione near Massa Marittima, where scanty remains of buildings (possibly of city walls) have also been found. This site seems to agree better with the indications of medieval documents. But certainly an Etruscan city was situated on the hill of Colonna, where there are remains of city walls of massive limestone, in almost horizontal courses. The objects discovered in its extensive necropolis have, after having been excavated, are now preserved in the museums of Grosseto and Florence. The most important were surrounded by tumuli, which still form a prominent feature in the landscape.

**VEUILLOT, LOUIS** (1813-1883), French journalist and man of letters, was born of humble parents at Boyes (Loiret) on the 11th of October 1813. When Louis Veuillot was five years old his parents removed to Paris. After a very slight education he entered a lawyer's office, and was sent in 1830 to serve on a Rouen paper, and afterwards to Périgueux. He returned to Paris in 1837, and a year later visited Rome during Holy Week. There he embraced extravagant ultramontane sentiments, and was from that time an ardent champion of Catholicism.

The results of his conversion appeared in *Pelerinage en Suisse* (1839), *Rome et Lorette* (1841) and other works. In 1843 he entered the staff of the *Univers religieux*. His violent methods of journalism had already provoked more than one duel, and for his polemics against the university of Paris in the *Univers* he was imprisoned for a short time. In 1848 he became editor of the paper, which was suppressed in 1860, but revived in 1869, when Veuillot recommended his ultramontane brother, which brought about a second suppression of his journal in 1874. When his paper was suppressed Veuillot occupied himself in writing violent pamphlets directed against the moderate Catholics, the Second Empire and the Italian government. His services to the papal see were fully recognized by Pius IX., on whom he wrote (1878) a monograph. He died on the 7th of March 1883.

Some of his scattered papers were collected in *Mélanges religieux, historiques et littéraires* (12 vols., 1855-75), and his *Correspondance* (6 vols., 1883-85) has been published. Eugene Veuillot, published (1901-4) a comprehensive and valuable life, *Louis Veuillot*.

**VEVEY** [German *Viest*], a small town in the Swiss canton of Vaud and near the eastern extremity of the Lake of Geneva. It is by rail 12 m. S.E. of Lausanne or 33 m. N.W. of the Vernet-Montreux railway station, while it is well served by steamers plying over the Lake of Geneva. In 1900 it had a population of 7729, of whom 8878 were French-speaking, while there were 8277 Protestants to 3424 Romanists and 59 Jews. It was the second town in point of population in the canton, coming next after Lausanne, though inferior to the "agglomeration" known as Montreux. It stands at the mouth of the Veveyse and commands fine views of the snowy mountains seen over the glassy surface of the lake. The whole of the surrounding
country is covered with vineyards, which (with the entertainment of foreign visitors) occupy the inhabitants. Every twenty years or so (last in 1889 and 1903) the Fête des Vigneron is held here by an ancient gild of vinecoders, and attracts much attention. Besides a railway line that joins the Montreux-Bernese Oberland line at Chambéry (5 m. from Vevey and 1½ m. below Le Vers) there is a funicular railway from Vevey up the Mont Pèlerin (3557 ft.) to the north-west.

Vevey was a Roman settlement [Viviscus] and later formed part of the barony of Vaud, that was held by the counties and dukes of Savoy until 536, when it was conquered by Bern. In 798 it was freed from Bernese rule and became part of the canton du Léman (renamed canton de Vaud in 1803) of the Helvetic Republic.

**VEXILLUM** (Lat. dim. of *vexelum*, piece of cloth, sail, awning, or from *vexere*, *vectum*, to carry), the name for a small ensign consisting of a square cloth suspended from a cross-piece fixed to a spear. The *vexillum* was strictly the ensign of the maniple, as *signum* was of the cohort, but the term came to be used for all standards or ensigns other than the eagle (*aquila*) of the legion (see FLAC). Caesar (B.G. ii. 20) uses the phrase *vexillum prpopone de* the red flag hoisted over the general's tent as a signal for the march or battle. The standard-bearer of the maniple held a vexillarius and added to his way of the time a vexillum, *vexillum* and *vexillarius* had gained a new significance. Tacitus uses these terms frequently both of a body of soldiers serving apart from the legion under a separate standard, and also with the addition of some word implying connexion with a legion of those soldiers who, after serving sixteen years with the legion, continued their service, under their own *vexillum*, with the legion. The term is also used for the scarf wrapped round a bishop's pastoral staff (*q.v.*). Modern science has adopted the word for the web or veil of a feather of a bird and of the large feathers of the followers, such as the pea, whose corolla is shaped like a butterfly.

**VEXIÓ, or Wexió, a town and bishop's see of Sweden, capital of the district (län) of Kronoberg, 124 m. N.E. of Malmö by rail. Pop. (1900) 3765. It is pleasantly situated among low wooded hills at the north end of Lake Vexiō, and near the south end of Lake Helga. Its appearance is modern, for it was burnt in 1843. The cathedral of St Sigfrid dates from about 1300, but has been restored, the last time in 1868. The Småland Museum has antiquarian and numismatic collections, a library and a building of Linnæus. There are iron furnaces, and the town possesses a glass works &c. Osten, the easternmost town of the province, is without the town, the poet Essaién Tengnér died in 1846, and he is buried in the town cemetery. On the shore of Lake Helga is the royal estate of Kronoberg, and on an island in the lake the ruins of a former castle of the same name.

**VÉZELAY, a village of France, in the department of Yonne, 10 m. W.S.W. of Avallon by road. Its population, which was over 10,000 in the middle ages, was 754 in 1906. It is situated on the summit and slopes of a hill on the left bank of the Cure, and owes its renown to the Madeleine, one of the largest and most beautiful basilicas in France. The Madeleine dates from the 12th century and was skilfully restored by Viollet-le-Duc. It consists of a narthex, with nave and aisles; a triple nave, without triforium, entered from the narthex by three doorways; transepts; and a choir with triforium. The oldest portion of the church is the nave, constructed about 1125. Its groined vaulting is supported on wide, low, semicircular arches, and on piers and columns, the capitals of which are embellished with sculptures full of animation. The narthex was probably built about 1130. The central entrance, leading from it to the nave, as one of the most important features of the church; it consists of two doorways, and is surmounted by a tympanum carved with a representation of Christ bestowing the Holy Spirit upon His apostles. The choir and transepts are later in date than the rest of the church, which they surpass in height and grace of proportion. They resemble the eastern portion of the church of St Denis, and were doubtless built in place of a Romanesque choir damaged in a fire in 1165. A crypt beneath the choir is perhaps the relic of a previous Romanesque church which was destroyed by fire in 1120. The west façade of the Madeleine has three portals; that in the centre is divided by a pier and surmounted by a tympanum sculptured with a bas-relief of the Last Judgment. The upper portion of this front belongs to the 13th century. Only the lower portion of the northernmost of the two flanking towers is left, and of the two towers which formerly rose above the transept that to the north has disappeared. Of the other buildings of the abbey, there remains a chapter-house (13th century) adjoining the south transept. Most of the ramparts of the town, which have a circuit of over a mile, are still in existence. In Père-Louve, consisting of two massive towers flanking a gateway, is in good preservation. There are several interesting old houses, among them one in which Theodore of Beza was born. Of the old parish church, built in the 17th century, the clock-tower alone is left. A mile and a half from Vézelay, in the village of St Père-sous-Vézelay, there is a remarkable Burgundian Gothic church, built by the monks of Vézelay in the 15th century. The west façade, flanked on the north by a fine tower, is richly decorated; its lower portion is formed of a projecting porch surmounted by a balustrade. The church is continued below ground.

The history of Vézelay is bound up with its Benedictine abbey, which was founded in the 9th century under the influence of the abbey of Cluny. This dependence was soon shaken off by the younger monastery, and the acquisition of the relics of St Magdalen, soon after its foundation, began to attract crowds of pilgrims, whose presence enriched both the monks and the town which had grown up round the abbey and acknowledged its supremacy. At the beginning of the 13th century the excitations of the abbey Artau, who required money to defray the expense of the reconstruction of the church, and the refusal of the monks to grant political independence to the citizens, resulted in an insurrection in which the abbey was burnt and the abbots murdered. During the next fifty years three similar revolts occurred, fanned by the counts of Nevers, who wished to acquire the suzerainty over Vézelay for themselves. The monks were, however, aided by the influence both of the Pope and of Louis VII., and the towns- men were unsuccessful on each occasion. During the 12th century Vézelay was the scene of the preaching of the second crusade in 1146, and of the assumption of the cross in 1190 by Richard Coeur de Lion and Philip Augustus. The history of the abbey began to diminish in 1280 when the Benedictines of St Maximin in Provence affirmed that the true body of St Magdalen had been discovered in their church; its decline was precipitated during the wars of religion of the 16th century, when Vézelay suffered great hardships.

**VIANDEN, an ancient town in the grand duchy of Luxemburg, on the banks of the Our, close to the Prussian frontier. Pop. (1903) 2350. It possesses one of the oldest charters in Europe, granted early in the 14th century by Philip, count of Vianden, from whom the family of Nassau-Vianden sprang, and who was consequently the ancestor of William of Orange and Queen Wilhelmina of Holland. The semi-mythical foundress of this family was Bertha, "the White Lady" who figures in many German legends. The original name of Vianden was Viennensis or Viena, and its probable derivation is from the Celtic *Vien* (rock). The extensive ruins of the ancient castle stand on an eminence of the little town, but the chapel which forms part of it was restored in 1849 by Prince Henry of the Netherlands. The size and importance of this castle may be gauged from the fact that the Knights' Hall could accommodate five hundred men-at-arms. A remarkable feature of the chapel is an hexagonal hole in the centre of the floor, opening upon a bare subterranean dungeon. This has been regarded as an instance of the "double chapel," but it seems to have been constructed by order of the crusader Count Frederick II. on the model of the Church of the Holy Sepulchre. In the neighbourhood of Vianden are other ruined castles, notably those of Stolzembourg and Falkenstein. The
VIANNA DO CASTELLO—VICAIRE

little town and its pleasant surroundings have been praised by many, among others by Victor Hugo, who resided here on several occasions. During his last visit he wrote his fine work

VIANNA DO CASTELLO, a seaport and the capital of the district of Viana do Castello, Portugal; at the mouth of the river Lima, which is here crossed by the iron bridge of the Oporto-Valença do Minho railway. Pop. (1900) 90,000. Viana do Castello has manufactures of lace and dairy produce. Its fisheries are important. Salmon and lampreys are exported, both fresh and preserved. The administrative district of Viana do Castello coincides with the northern part of the ancient province of Entre Minho e Douro. (q.v.). Pop. (1900) 212,267; area, 837 sq. m.

VIAREGGIO, a maritime town and sea-bathing resort of Tuscany, Italy, in the province of Lucca, on the Mediterranean, 13 m. N.W. of Pisa by rail, 7 ft. above sea-level. Pop. (1900) 14,883 (town); 21,557 (commune). Being sheltered by dense pine-woods on the north, and its malaria having been banished by drainage, it is frequented as a winter resort, and in summer by some thousands for its sea-bathing. In 1740 the population was only 300, and in 1841, 6549. The majority of the inhabitants were fishermen, but after his death by drowning in 1822. The town possesses a school of navigation and a technical school, and carries on some shipbuilding.

VIATICUM (a Latin word meaning "provision for a journey"); Gr. τα ἀναμεμελήδεα, is often used by early Christian writers to denote the sacrament of the Eucharist, and is sometimes also applied to baptism. Ultimately it came to be employed in a restricted sense to denote the last communion given to the dying. The 13th council of the council of Nicaea is to the effect that "none, even of the lapsed, shall be deprived of the last and most necessary viaticum (viaticum), and the bishop is to give the obligation to all who desire to partake of the Eucharist on the point of death. The same principle still rules the canon law, it being of course understood that penitential discipline, which in ordinary circumstances would have been due for their offence, is to be undergone by lapsed persons who have thus received the viaticum, in the event of recovery. In extreme cases it is lawful to administer the viaticum to persons not fasting, and the same person may receive it frequently if his illness be prolonged. The ritual to be observed in its administration is that in which the bishop, or another priest, offers the communion of the sick, except in the words of the formula, which is "accipe, carissime frater (carissima soror), viaticum corposi nostri Jesu Christi, quod te custodiat ab hoste maligno, protecte te, et perducat te ad vitam aeternam. Amen." Afterwards the priest raises his fingers in a little water, which the communicant drinks. The viaticum is given before extreme unction, a reversal of the medieval practice due to the importance of receiving the Eucharist while the mind is still clear. In the early centuries the sick, like those in health, generally received both kinds, though there are instances of the viaticum being given under one form only, sometimes the bread and sometimes, where swallowing was difficult, the wine. In times of persecution laymen occasionally carried the viaticum to the sick, a practice that persisted into the 9th century, and deacons continued to do so even after the Council of Ancyra (near Lyons) in 900 restricted the function to priests.

VIBORG, a town of Denmark, capital of the amt (county) of its name, lying in the bleak midland district of Jutland, though the immediate situation, on the small Viborg lake, is picturesque. Pop. (1901) 8623. It has a station on the railway running east and west between Langaa and Vemb. The most notable building is the cathedral (1310-1690, restored 1862-1876). The Black Friars' church is of the 13th century, and the museum possesses specimens of the Stone, Bronze and Iron Ages, also mediaeval antiquities. The Borgevold Park borders the lake on the site of a former castle. The industries embrace distilleries, iron foundries and manufactures of cloth. The country to the south attains to a certain degree of beauty near Lake Hall, where the ground is slightly elevated.

VIBORG (Finnish Viipuri), capital of a province of the same name in Finland, is situated at the head of the Bay of Viborg in the Gulf of Finland, at the mouth of the Saima Canal and on the railway which connects St Petersburg with Helsingfors. Population of the town (1904) 44,672, of the province 458,260. The Saima Canal (37 m. long), a fine engineering work, connects with the sea Lake Saima—the principal lake of Finland, 240 ft. above sea-level—and a series of others, including Puruvesi, Orivesi, Höytlänen and Kallavesi, all of which are navigated by steamers, as far north as Iisalmi in 63° 36' N lat. Viborg is thus the seaport of Karelia and eastern Savolaks, with the towns of Viipuri and the former Finnish city of Viborg (1293), Mysliv (1269), Kupio (13519) and Iisalmi, with their numerous saw-mills and iron-works. Viborg stands most picturesqueon the glaciated and dome-shaped granite hills surrounding the bay, which is protected at its entrance by the naval station of Björkoo and at its head by several forts. The castle of Viborg, built in 1293 by Marshal Torkel Knutson, was the first centre for the spread of Christianity in Karelia, and for establishing the power of Sweden; it is now used as a prison. Its lofty and elegant tower has fallen into decay. The court-house (1839), the town-house, the gymnasia (1641); with an excellent library is a most ancient, and the new one (1904); the imperial grand of Pungaharu; the Imatra rapids, by which the Vuoksen discharges the water of Lake Saima into Lake Ladoga, with the castle of Kexholm at its mouth; Serdobol and Valamo monastery on Lake Ladoga—all visited from Viborg—attract many tourists from St Petersburg as well as from other parts of Finland.

VIBURNUM, in medicine, the dried bark of the black hawk or Viburnum prunifolium, grown in India and North America. The black hawk contains viburnin and valerianic, tannic, gallic, tartaric and malic acids. The British Pharmacopoeial preparation is the Expectorant from Viburnum, Prunifolium liquidum; the United States preparation is the fluid extract prepared from the Viburnum opulus. The physiological action of viburnum is to lower the blood pressure. In overdose it depresses the motor functions of the spinal cord and so produces loss of reflex and paralysis. Therapeutically the drug is used as an anti-spasmodic in dysmenorrhoea and in menorrhagia.

VICAIRE, LOUIS GABRIEL CHARLES (1848-1900), French poet, was born at Belfort on the 25th of January 1848. He served in the campaign of 1870, and then settled in Paris to practise at the bar, which, however, he soon abandoned for literature. His work was twice "crowned" by the Academy, and in 1892 he received the cross of the Legion of Honour. Born in the Vosges, and a Parisian by adoption, Vicaire remained all his life an enthusiastic lover of the country to which his family belonged—La Bresse—spending much of his time at Ambérieu. His freshest and best work is his Émaux bressans (1884), a volume of poems full of the gaiety and spirit of the old French chansons. Other volumes followed: Le Livre de la patrie, L'Heure enchantée (1896), À la bonne franquette (1897), Au bois joli (1892), and Le Clas des fées (1897). He wrote in collaboration with Jules Truffier two short pieces for the stage, Fleurs d'avril (1896) and La Force du mardi refoulée (1897); also the Miracle de Saint Nicolas (1888). With his friend Henri Beaulieu he produced a parody of the Decadents entitled Les Déliteusecques and signed Adoré Floupette. His fame rests on his Émaux bressans and on his Rabelaisian drinking songs; the religious and fairy poems.
VICAR—VICE-CHANCELLOR

Charming as they often are, carry simplicity to the verge of affectation. The poet died in Paris, after a long and painful illness, on the 23rd of September 1900.

See Henri Corbel, Un Poète, Gabriel Vicaire (1902).

VICAR (Lat. vicarius, substitute), a title, more especially ecclesiastical, describing various officials acting in some special way for a superior vicar-apostolic or vicar-general. The institution of vicarius is derived from the condition of an under-slave kept by another as part of his private property. The vicarius was an important official in the reorganized empire of Diocletian. It remained as a title of secular officials in the middle ages, being applied to persons appointed by the Roman emperor to judge cases in distant parts of the empire, or to wield power in certain districts, or, in the absence of the emperor, over the whole empire. The prefects of the city at Rome were called Vicarii Romae. In the early middle ages the term was applied to representatives of a count administering justice for him in the country or small towns and dealing with unimportant cases, levying taxes, &c. Monasteries and religious houses often employed a vicar to answer to their feudal lords for those of their lands which did not pass into mortmain.

The title of "vicar of Jesus Christ," borne by the popes, was introduced as their special designation during the 8th century, in place of the older style of "vicar of St Peter" (or vicarius principis apostolorum). In the early Church other bishops commonly described themselves as vicars of Christ (Du Cange gives an example as late as the 9th century from the capitularies of Charles the Bald); but there is no proof of their case, or indeed in that of "vicar of St Peter" given to the popes, that it was part of their formal style. The assumption of the style "vicar of Christ" by the popes coincided with a tendency on the part of the Roman chancery to insist on placing the pontiff's name before that of emperors and kings and to refuse to other bishops the right to add the latter to their names of the 10th century. (Mas Latrie, s.v. "Sabinien," p. 1047.) It was not till the 13th century that the alternative style "vicar of St Peter" was definitely forbidden, this prohibition thus coinciding with the extreme claims of the pope to rule the world as the immediate "vicar of God" (see INNOCENT III).

All bishops were looked upon as in some sort vicars of the pope, but the title vicarius sedis apostolicae came especially to be applied as an alternative to legatus sedis apostolicae to describe papal legates to whom in certain places the pope delegated a portion of his authority. Pope Benedict XIV. tells us in his treatise De synodo dioecesana that the pope often names vicars-apostolic for the government of a particular diocese because the episcopal see is vacant or, being filled, the titular bishop cannot fulfill his functions. The Roman Catholic Church in England was governed by vicars-apostolic from 1539 to 1559. When Pius IX. re-established the hierarchy, vicars-apostolic at the present day are nearly always titular bishops taking their titles from places not acknowledging allegiance to the Roman Catholic Church. The title is generally given by the pope to bishops sent on Eastern missions.

A neighbouring bishop was sometimes appointed by the pope vicar of a church which happened to be without a pastor. A special vicar was appointed by the pope to superintend the spiritual affairs of Rome and its suburbs, to visit its churches, monasteries, &c., and to correct abuses. It became early a custom for the prebendaries and canons of a cathedral to employ "priest-vicars" or "vicars-choral" as their substitutes when it was their turn to be dehdomedary to sing High Mass and conduct divine office. In the English Church these priest-vicars remain in the cathedrals of the old foundations as beneficed clergy on the foundation; in the cathedrals of the new foundation they are paid by the chapters. "Lay vicars" also were and are employed to sing those parts of the office which can be sung by laymen.

In the early Church the assistant bishops (choreepiscopi) were sometimes described as vicarii episcoporum. The employment of vicar-apostolic was no means general in the early Church but towards the 13th century it became very general for a bishop to employ a vicar-general, often to curb the growing authority of the archdeacons. In the middle ages there was not a very clear distinction drawn between the vicar and the official of the bishop. When the voluntary and contentious jurisdiction came to be distinguished, the former fell generally to the vicars, the latter to the officials. In the style of the Roman chancery, official documents are addressed to the bishops or their vicars for dioceses beyond the Alps, but for French dioceses to the bishops or their vicars-apostolic. The institution of vicar-general is to help the bishop is now general in the Catholic Church, but it is not certain that a bishop is obliged to have such an official. He may have two. Such a vicar possesses an ordinary and not a delegated jurisdiction, which he exercises like the bishop. He cannot, however, exercise functions which concern the episcopal order, or confer benefices without express and particular commission. In the Anglican Church a vicar-general is employed by the archbishop of Canterbury and some other bishops to assist in such matters as ecclesiastical visitations. In the Roman Catholic Church bishops sometimes appoint lesser vicars to exercise a more limited authority over a limited district. They are called "vicars-forane" or rural deans. They are entrusted especially with the surveillance of the parish priests and other priests of their districts, and with matters of ecclesiastical discipline. They are charged especially with the care of sick priests and in case of death with the celebration of their funerals and the charge of their vacant parishes. In canon law priests doing work in place of the parish priest are called vicars. Thus in France the curé or head priest in a parish church is assisted by several vicars.

Formerly, and especially in England, many churches were appropriated to monasteries or colleges of canons, whose custom it was to appoint one of their own body to perform divine service in such churches, but in the 19th century such corporations were obliged to appoint permanent paid vicars who were called perpetual vicars. Hence in England the distinction between rectors, who draw both the greater and lesser tithes, and vicars, who are attached to parishes of the greater tithes, formerly held by monasteries, are now drawn by lay rectors. (See APPROPRIATION.)

Favre (Nîort, 1883, &c.); Migne, Encyclopédia theoligique, series i. vol. 10 (Droit Canon): Comte de Mas Latrè, Trésor de chronologie (Paris, 1889); and Sir R. J. Phillimore, Ecclesiastical Law of the Church of England (2d ed. 1893). (E. O’N.)

VICE. (1) (Through Fr. from Lat. vitium), a fault, blemish, more specifically a moral fault, hence depravity, sin, or a particular form of depravity. In the medieval morality plays a special character who acted as an attendant on the devil was styled the "Vice," but sometimes took the name of specific vice such as Envy, Fraud. Iniquity and the like. He was usually dressed in the garb that is identified with that of the domestic fool or jester, and was armed with a wooden sword or dagger. (2) (M.E. vise, vies or vye; Fr. vis; Lat. vitis, a vine, or bryony, i.e. something that twists or winds), a portable or fixed tool or appliance which holds or grips an object while it is being worked; a special form of clamp. The tool consists essentially of movable jaws, either joined by a hinge or moving on slides, and the closing motion is applied by a screw, whence the name, as of something which turns or winds, or by a lever, ratchet, &c. (see TOOLS). (3) (Lat. vicie, in place of, abl. sing. gen. not found in the nom.), a vicar usually used as a possessive in combination with names of office-holders, indicating a position subordinate or alternative to the chief office-holder, especially one who takes second rank or acts in default of his superior, e.g. vice-chairman, vice-admiral, &c.

VICE-CHANCELLOR, the deputy of a chancellor (q.v.). In the English legal system vice-chancellors in equity were formerly important officials. The first vice-chancellor was appointed in 1813 in order to lighten the work of the lord chancellor and the master of the rolls, who were at that time the sole judges in equity. Two additional vice-chancellors were appointed in 1841. The vice-chancellors sat separately from the lord chancellor and the lords justices, to whom there was an appeal from their decisions. By the Judicature Act 1873
they became judges of the High Court of Justice, retaining their titles, but it was enacted that on the death or retirement of any one his successor was to be styled "judge." Vice-chancellor Sir J. Bacon (1798-1853) was the last to hold the office, resigning in 1886.

Vice-chancellor is also the title given to the judge of the ducal court of Lancaster. For the vice-chancellor of a university, see Chancellor.

VICENTE, GIL (1470-1540), the father of the Portuguese drama, was born at Guimarães, but came to Lisbon in boyhood and studied jurisprudence at the university without taking a degree. In 1493 we find him acting as master of rhetoric to the duke of Beja, afterwards King Manoel, a post which gave him admission to the court; and the Cancioneiro Geral contains some early lyrics of his which show that he took part in the famous ares de paso. The birth of King John III. furnished the occasion for his first dramatic essay—The Neatherd's Monologue, which he recited on the night of the 7th-8th June 1502 in the queen's chamber in the presence of King Manoel and his court. It was written in Spanish out of compliment to the queen, a daughter of Ferdinand and Isabella, and because that language was then the fashionable medium with the higher classes. This manger-hymn, which was a novelty in Portugal, so pleased the king's mother, the infanta D. Beatriz, that she desired Gil Vicente to repeat it the following Christmas, but he composed instead the Castiliano Pastoral Auto, a more developed piece in which he introduced Portuguese society. The infanta, pleased again, required a further diversion for Twelfth Day, whereupon he produced the Auto of the Wise Kings. He had now established his reputation as a playwright, and for the next thirty years he entertained the courts of Kings Manoel and John III., accompanying them as they moved from place to place, and providing by his autos a distraction in times of calamity, and in times of rejoicing giving expression to the feelings of the people. Though himself both author and actor, Gil Vicente had no regular company of players, but it is probable that he easily found students and court servants willing to get up a part for a small fire, and occasionally run for more than one night. The Auto of the Sybil Cassandra (produced at the monastery of Euxorabgas at Christmas 1503), the Auto of St Martin (played in the church at Caldas on the feast of Corpus Christi 1504), and a mystery play, the Auto of the Four Seasons, all belong, like their predecessors, to the religious drama, but in 1505 Gil Vicente wrote a comedy of real life, Who has Bran to sell, a title given it by the public. It is a clever farce depicting an amorous poor squire and his ill-paid servant, and opens a rich portrait-gallery in which the dramatic artist intro due all classes of Portuguese society, depicting the failings of each with the freedom of a Rabelais. The next year saw no new play, but in 1506 Gil Vicente delivered before the court at Almeirim a sermon in verse on the theme Non volo, volo, et deficior, in which he protested against the intolerance shown to the Jews, just as in 1531 he interfered to prevent a massacre of the "New Christians" at Santarem. The Auto of the Soul, a Catholic prototype of Goethe's Faust, containing some beautiful lyrics, appeared in 1508, and in 1509 the Auto da India, a farce which has the earliest enterprise of his countrymen for background, while the Auto da Fama (1516) and the Exhortation to War (1513) are inspired by the achievements that made Portugal a world-power. If the farce of The Old Man of the Garden (1514) breathes the influence and spirit of the Celestina, the popular trilogy of the Beasts of Hell, Purgatory and Glory (1517, 1538, 1550) is at once a death of man, full of splendid pagentry and caustic irony, and a kind of Portuguese Divina Commedia. The Auto of the Fairies (1516), the Face of the Doctors (1530) and the Comedy of Rubens (1521) ridicule unchaste clerics and ignorant physicians with considerable freedom and a medieval coarseness of wit, and the Face of the Giants is interesting as the first piece of the European theatre dealing professedly with that race. Ligez Pereira, which was to be Gil Vicente's masterpiece, was produced in 1523 before King John III. at the convent of Christ at Tomar, and owed its origin to certain men of bom sober, perhaps envious partisans of the classical school. They pretended to doubt his authorship of the autos, and accordingly gave him as a theme for a fresh piece the proverb: "I prefer an ass that carries me to a horse that throws me." Gil Vicente accepted the challenge, and produced a triumphant reply to his detractors in this comedy of ready wit and lively dialogue, the Auto da Esperança (1526), the Forge of Love (1525) and The Beira Priest (1526) satirize the maladministration of justice by ignorant magistrates and the lax morals of the regular clergy, and the Face of the Muleteers (1526) dramatizes the type of poor nobleman described in Cleyhart's Letters. The Comedy of the Arms of the City of Coimbra (1527) has a considerable antiquarian interest, and the facetious Ship of Love is full of quaint imagery, while the lengthy Auto of the Fair (1537), with its twenty-two characters, may be described as at once an indictment of the society of the time and a protest against all that is strange and Christian and a telling appeal for the reform of the church. In this off-quoted romance, Rome personified comes to the booth of Mercury and Time, and offers her indulgences, saying, "Sell me the peace of heaven, since I have power here below"; but Mercury refuses, declaring that Rome absolves the whole world and never thinks of her own sins. The play concludes with a dance and hymn to the Blessed Virgin. The Triumph of Winter (1530) exposes the unskilful pilots and ignorant seamen who cause the loss of ships and lives on the route to India, and the Auto da Lustiania (1532) portrays the household of a poor Jewish tailor, ending with a curious fable about the fool and the three wise men. The Auto of the Pilgrimage of the Agrieved (1533) is an attack on discontent and ambition, lay and clerical. After representing the Auto da Festa for the Conde de Vímioso (1535), and dramatizing the romances of chivalry in D. Duarte's and Amadís de Gaula, Gil Vicente ended his dramatic career in 1536 with a mirthful comedy, The Garden of Deceptions. He spent the evening of life in preparing his works for the press at the instance of King John III., and died in 1540, his wife Branca Beixerra having predeceased him. Four children were born of their union, and among them Paula Vicente attained distinction as a member of the group of cultured women who formed a sort of female academy presided over by the infanta D. Maria.

The forty-four pieces comprising the theatre of Gil Vicente fall into the point of view of two groups: (1) those in Portuguese only, numbering fourteen; (2) those in Spanish only, numbering eleven; and (3) the bilingual, being the remainder, nineteen in all. They are also from their nature divisible as follows: a. Religious plays or of churchmen, which in the main are a development of the mystery or miracle play of the middle ages; and they may be subdivided into (1) Biblical pieces; (2) pieces connected with the history of the Portuguese kingdom. In this department Gil Vicente reaches his highest poetical flights, and the Auto of the Soul is a triumph of elevation of idea and feeling allied to beauty of expression. b. Aristocratic works, or tragedies, the composition of which was the result of his contact with the court; these, though often more spectacular than strictly dramatic, are remarkable for opulence of invention and sweetness of versification. c. The popular theatre, or comedies and farces. Gil Vicente's plays contain some evidence of his knowledge and appreciation of French poetry; e.g. The Beira Judge bears a general likeness to the products of the Clercs de la Basoche, and his Testa- dores and the Portuguese Paré des Fleurs are strongly reminiscent of François Villon. Most of the plays are written in the national redondilha verse, and are preceded by initial rubrics stating the date when, the place where, in whose presence, and on what occasion the play was performed, and these make up the annals of the first thirty-four years of the Portuguese drama. Most of them were put on the stage at the different royal palaces; some, however, were played in hospitals, and, I am told, of which the subjects are liturgical at the great festivals of Christmas, Epiphany and Maundy Thursday, others on the happening of some event of importance to the royal family or the state. Many of them contain episodes that are never set to music by the author, or collected by him from popular sources, while at the close the characters leave the stage singing and dancing, as was the custom in the medieval comedies.

The large number of plays in Spanish, they are all eminently national in idea, texture and subject. No other Portuguese writer reflects so faithfully the language, types, customs and colour of his age as Gil Vicente, and the rudest of his dramas are full of genuine comic feeling. If they never attain to perfect
VICENZA

art, they possess the supreme gift of life. None of them are, strictly speaking, historical, and he never attempted to write a tragedy. However, he was able to create the products of the classical theatre as did Sà de Miranda and Ferreira, but though he remained faithful to the Old or Spanish school in form, yet he had imbued the critical spirit and mental ferment of the Renaissance without its culture or erudition. Endowed by nature with acute observation and considerable powers of analysis, Gil Vicente possessed a felicity of phrase and an unmatched knowledge of popular superstitions and ceramic lore. Above all, he was a moralist, and as such he presented his heart and soul unmasked, without any of his inexcusable parade and ridicule as his main weapons; but if his inventive is often stinging it is rarely bitter, while more than one incident in his career shows that he pitied rather than hated the partiality of the age. In short, he was a great innovator, and, as Dr Garnett truly remarked, "One little corner of Europe alone possessed in the early 16th century a drama at once living, indigenous and admirable as literature."

Gil Vicente perhaps lacks psychological depth, but he possesses a breadth of mental vision and a critical acumen unknown in any national dramatist. In his attitude to religion he acts the spokesman of the better men of his age and country. A convinced but liberal-minded Catholic, he has no sympathy with attacks on the unity of the Church, but he cries out for a reform of morals, pillorying and igniting the popes, as well as those who are paddling the most bitter things of the popes and their court. He strove to take a middle course at a time when moderation was still possible, though, had he lived a few years longer, in the reign of religious persecution, he would have attempted to substitute for religious toleration, had he been able to, what he afterwards found, it not a worse fate. He is a great dramatist in embryo, who, if he had lived several years later, might, with his literary style, and expression, might with added culture have surpassed Calderon and taken his place as the Latin and Catholic rival of Shakespeare.

Some of the plays were printed in Gil Vicente's lifetime, but the first collected edition, which included his lyrics, was published after his death by his son Luiz (1562), with a dedication to King Sebastian. A second edition appeared in 1586, with various omissions and alterations made at the instance of the Inquisition. A critical edition of the text in 3 vols. came out at Hamburg (1834) with a glossary and introductory essay on Vicente's life and writings, and a poor reprint of this edition is dated Lisbon 1852. He has never found a translator, doubtless because of the difficulty of rendering his form and explaining his wealth of topical allusions.

AUTHORITIES.—Dr Theophilo Braga, Gu Vicente e as origens do teatro nacional (Oporto, 1868); J. J. de Brito Rebelo, Gil Vicente (Lisboa, 1902): "The Portuguese Dramas in the 16th Century—Gil Vicente," in the Manchester Quarterly (July and October 1897) introduction by the Conde de Sabugosa to his edition of the Auto de festa (Lisbon, 1890).

VICENZA, a town and episcopal see of Venetia, Italy, capital of the province of Vicenza, 42 m. W. of Venice by rail, 131 ft. above sea-level. Pop. (1901) 32,200 (town); 47,535 (commune). It lies at the northern base of the Monti Berici, on level ground, with a river in the town called the Bacchiglione. It was surrounded by 13th century walls, once about 3 m. in circumference, but these are now in great part demolished. Though many of the streets are narrow and irregular, the town has a number of fine buildings, many of them the work of Andrea Palladio. The best of these is the town hall, otherwise known as the basilica, one of the finest works of the Renaissance period, of which Palladio himself said that it might stand comparison with any similar work of antiquity. It is especially noteworthy owing to the difficulty of the task the architect had to accomplish. In the mirror, standing against the Bacchiglione della Ragione, a Gothic building of the latter half of the 15th century, which the colonnades of the basilica entirely enclose. It was begun in 1449, but not finished till 1614, long after his death. He also designed many of the fine palaces which give Vicenza its individuality; only two of them, the Barbarano and Chierici palaces (the latter containing the picture gallery), have two orders of architecture, the rest having a heavy rustic basis with only one order above it. Many palaces, however, have been wrongly attributed to him which are really the work of Scamozzi. This last work he claims for himself, and the Olimpico was begun by him, but only finished after his death; it is a remarkable attempt to construct a theatre in the ancient style, and the stage, with the representation of streets ascending at the back, is curious. The cathedral, which is Italian Gothic, dating mainly from the 13th century, consists of a nave with eight chapels on each side, and a very high Renaissance domed choir; it contains examples of the Montagnas and of Lorenzo da Venezia. The churches of S. Lorenzo (1280-1344) and S. Corona (1260-1300), both of brick, are better examples of Porto Sagredo's style. In 1549, Palladio published his second book on architecture (Architettura universale, 1615). Palladio inaugurated a school of followers who continued to erect similar buildings in Vicenza even down to the French Revolution.

(See V. G. Pettinà, Vicenza (Bergamo, 1905).)

(T. A.)
VICEROY—VICKSBURG

VICEROY (from O. Fr. viceroy, mod. vœro, i.e. Lat. vicere, in place of, and rey or roi, king), the governor of a kingdom or colony to whom is delegated by his sovereign the power to exercise regal authority in his name. The lord-lieutenant of Ireland and the governor-general of India are frequently referred to as viceroys, but the title has no official recognition in British government.

VICH, a city of north-eastern Spain, in the province of Barcelona, on the river Guri, a small right-hand tributary of the Ter, and on the Granollers-Ripoll railway. Pop. (1900) 11,628. Vich is an ancient episcopal city, with narrow, ill-paved streets and many curious old houses irregularly built on the slope of a hill, which rises above one of the side valleys of the Ter basin. The cathedral, founded about 1400 and built chiefly in the 14th century, was to some extent modernized in 1883. Its Gothic choisters (1340) are remarkable for the tasteful tracery in their windows, and there is a fine altar of sculptured marble. Some valuable manuscripts are preserved in the library of the chapter-house, and the museum contains an interesting archaeological collection, besides statuary, pictures, &c. The city is locally celebrated for the manufacture of sausages; other industries include tanning and the weaving of linen and woollen fabrics.

Vich, the Ausa of the ancient geographers, was the chief town of the Ausetani; in the middle ages it was called Ausona and Vicus Ausonensis, hence Vie de Osona, and simply Vich. Vich was a military station of considerable importance in the time of the Romans. It afterwards lost its celebrity and did not regain it till the 17th century, in the latter half of which they were visited and written of by Madame de Sévigné. Within the city or in its immediate vicinity there are between thirty and forty springs, twelve of which are state property, four of these having been tapped by boring. The waters of those which are in the town are drawn by means of aqueducts. The most celebrated and frequented are the Grande Grille, L'Hôpital, the Célestins, and Lardy. The most copious of all, the Puits Carré, is reserved for the baths. All these, whether cold or hot (maximum temperature, 113°F.), are largely charged with bicarbonate of soda; some also are chalybeate and tonic. The waters, which are limpid, have an alkaline taste and emit a slight odour of sulphuretted hydrogen. They are recommended in cases of stomachic and liver complaint, also for diabetes, gravel and gout. Large quantities are bottled and exported. A luxurious bathing establishment, the property of the state, was opened in 1901, and it has since been overwhelmed by the demand for water. The waters of Vich have the hydropathic establishments of Lardy, Larbaud and L'Hôpital, and a large military hospital, founded in 1843. A fine casino and two public parks add to its attraction. The promenade commands a splendid view of the mountains of Auvergne. Gusset, about 1 m. distant, has similar mineral waters and a bathing establishment.

VICKSBURG, a city and the county-seat of Warren county, Mississippi, U.S.A., on the Mississippi and Yazoo rivers, 44 m. by rail W. of Jackson, and 336 m. N. by W. of New Orleans. Pop. (1900) 13,373; (1906) 14,534, of whom 8147 were negroes; (1910 census) 20,814, making it the second largest city in Mississippi. It is served by the Alabama & Vicksburg, the Vicksburg, Shreveport & Pacific, and the Yazoo & Mississippi Valley railways, and by steamboat lines. It is built among the Walnut Hills, which rise about 260 ft. above the river. Among the principal buildings and institutions are the court-house, standing on one of the highest hills, a fine Federal building, the city hall, a state charity hospital, an infirmary, a sanatorium, a public library, the medical college of the university of Mississippi, All Saints' Episcopal College (Protestant Episcopal, 1909) for girls, Saint Francis Xavier's Academy, and Saint Aloysius College (Roman Catholic). The Civil War battle-ground has been converted into a beautiful National Military Park comprising 185 acres, and containing numerous markers, memorials and monuments, including one (1910) to Lieut.-General Stephen Dill Lee, who was superintendent of the Military Park from 1899 until his death in 1908. On the bluffs just beyond the northern limits of the city and adjoining the Military Park is the Vicksburg National Cemetery, in which are the graves of 16,802 Federal soldiers (12,760 unknown). The principal industry of Vicksburg is the construction and repair of rolling stock for steam railways. It has also a dry dock and cotton compresses; and among its manufactures are cottonseed oil and cake, hardwood lumber, furniture, boxes and baskets. In 1905 the factory products were valued at $1,887,924. The city has a large trade in long-staple cotton grown in the surrounding country. It is a port of entry but has practically no foreign trade.

The French built Fort St Peter near the site of Vicksburg early in the 18th century, and on the 2nd of January 1730 its garrison was murdered by the Yasso Indians. As early as 1783 the Spanish erected Fort Nogales, and in 1798 this was taken by some United States troops and renamed Fort McHenry. The first permanent settlement in the vicinity was made about 1811 by Rev. Newell (or Nestell) Vick (d. 1840), a Methodist preacher. In accordance with his will a town was laid out in 1824, and Vicksburg was incorporated as a town in 1825, and was chartered as a city in 1836. The campaigns of which it was the centre in 1862 and 1863 are described below. Vicksburg was the home of Seargent Smith Prentiss from 1832 to 1845.

Campaign of 1862—63.—Vicksburg is historically famous as being the centre of interest of one of the most important campaigns of the Civil War. The command of the Mississippi, which would imply the severance of the Confederacy into two halves, and also the reopening of free commercial navigation from St Louis to the sea, was one of the principal objects of the Western Union armies from the time that they began their southward advance from Illinois, Missouri and Kentucky in February 1862. A series of victories in the spring and summer carried them as far as the line Memphis—Corinth, but in the autumn they came to a standstill and were called back to the Chesapeake. These armies were accompanied by a flotilla of thinly armed but powerful gunboats which had been built on the upper Mississippi in the autumn of 1861, and had co-operated with the army at Fort Donelson, Shiloh and Island No. 10, besides winning a victory on the water at Memphis. At the same time a squadron of sea-going vessels under Flag-officer Farragut had forced the defences of New Orleans (q.v.) and, accompanied by a very small military force, had steamed up the great river. On reaching Vicksburg the heavy vessels again forced their way past the batteries, but both Vicksburg and at Port Hudson they had to deal no longer with low-sited fortifications, but with inconspicuous earthworks on bluffs far above the river-level, and they failed to make any impression. Farragut then returned to New Orleans. From Helena to Port Hudson the Confederates maintained complete control of the Mississippi, the improvised fortresses of Vicksburg, Port Hudson and Arkansas Post (near the mouth of Arkansas river) being the framework of the defence. It was to be the task of Grant's army around Corinth and the flotilla at Memphis to break up this system of defences, and, by joining hands with Farragut and clearing the whole course of the Mississippi, to cut the Confederacy in half.

The long and painful operations by which this was achieved group themselves into four episodes: (a) the Grenada expedition

1 The channel of the Mississippi has changed greatly: until 1876 the entire city was on the Mississippi, which made a bend forming a tongue of land opposite the city; in 1876 the river cut across this tongue and formed an island, making the northern part of the city front on the shallow "Lake Centennial." The Federal government, by turning the Yazoo through a canal across the upper end of the channel, gave the city a river front once more.
of Grant's force, (b) the river column under McClelhand and Sherman, (c) the operations in the bayous, and (d) the final "overland" campaign from Grand Gulf. The country in which these operations took place divides itself sharply into two zones, the upland east of the river, upon which it looks down from high bluffs, and the levels west of it, which are a maze of bayous, backwaters and side channels; the intervening land being kept dry near the river itself by artificial banks (levese) but elsewhere swampy. At Vicksburg, it is important to observe, the bluffs trend away from the Mississippi to follow the course of the Yazoo, rejoining the great river at Memphis. Thus there are two obvious lines of advance for the Northern army, on the upland (Memphis and Grand Junction on Grenada-Jackson), and downstream through the bayou country (Memphis-Helena-Vicksburg). The main army of the defenders, who were commanded by Lieut.-General J. C. Pemberton, between Vicksburg and Jackson and Grenada, could front either north against an advance by Grenada or west along the bluffs above and below Vicksburg.

Retreating from the upland, Grant sailed down the river and joined McCleland and Sherman at Miliken's Bend at the beginning of February, and, superseding the resentful McCleland, assumed command of the three corps (XIII., McCleland; XV., Sherman; XVII., McPherson) available. He had already imagined the daring solution of his most difficult problem which he afterwards put into execution, but for the present he tried a series of less risky expedients to reach the high ground beyond Pemberton's bluffs, without indeed much confidence in their success, yet desirous in these unhealthy flats of keeping up the spirits of his army by active work, and of avoiding, at a crisis in the fortunes of the war, any appearance of discouragement. Three such attempts were made in all, with the co-operation of the flotilla under Captain David D. Porter. First, Grant endeavoured to cut a canal across the bend of the Mississippi at Vicksburg, hoping thus to isolate the fortress, to gain a water connection with the lower river, and to land an army on the bluffs beyond Pemberton's left flank. This was unsuccessful. Next he tried to make a practicable channel from the Mississippi to the upper Yazoo, and so to turn Pemberton's right, but the Confederates, warned in time, constructed a fort at the point where Grant's advance emerged from the bayous. Lastly, an advance through a maze of creeks (Steele's Bayou expedition), towards the middle Yazoo and Haines's Bluff, encountered the enemy, not on the bluffs, but in the low-lying woods and islands, and these so harassed and delayed the progress of the expedition that Grant recalled it. Shortly afterwards Grant determined on the manœuvre in rear of Vicksburg which established his reputation. The troops marched overland from Milliken's Bend to New Carthage, and on the 16th of April Porter's gunboat flotilla and the transports ran past the Vicksburg batteries. All this, which involved careful arrangement and hard work, was done by the 24th of April. General Banks, with a Union army from New Orleans, was now advancing up the river to invest Port Hudson, and by way of diverting attention from the Mississippi, a cavalry brigade under Benjamin Grierson rode from La Grange to Baton Rouge (600 m. in 16 days), destroying railways and magazines and cutting the telegraph
wires en route. Sherman's XV. corps, too, made vigorous demonstrations at Haines's Bluff, and in the confusion and uncertainty Pemberton was at a loss.

On the 30th of April McClernand and the XIII. corps crossed the Mississippi 8 m. below Grand Gulf, followed by McPherson. The nearest Confederate brigades, attempting to oppose the advance at Port Gibson, were driven back. Grant had now deliberately placed himself in the middle of the enemy, and although he had no natural strength of position, other than what was gained by the movement of his barges carrying his supplies from Milliken's Bend to New Carthage, his long line of supply curving round the enemy's flank was very exposed. But his resolute purpose outweighed all text-book strategy. Having crossed the Mississippi, he collected wheeled transport for five days' rations, and on Sherman's arrival cut loose from his base altogether (May 27th). Free to move, he aimed north from the Big Black river, so as to interpose between the Confederate forces at Vicksburg and those at Jackson. A fight took place at Raymond on the 12th of May, and Jackson was captured just in time to forestall the arrival of reinforcements for Pemberton under General Joseph E. Johnston. The latter, being in supreme command of the Confederates, ordered Pemberton to come out of Vicksburg and attack Grant. But Pemberton did not so until it was too late. On May 16th Grant, with all his forces well in hand, defeated him in the battle of Champion Hill with a loss of nearly 4000 men, and sharply pursuing him drove him into Vicksburg. By the 19th of May Vicksburg and Pemberton's army in it was invested by land and water. Grant promptly assailed his works, but was repulsed with loss (May 19th); the assault was repeated on the 22nd of May, with the same result, and Grant found himself compelled to retreat to a blockade. Reinforcements were hurried up from all quarters, Johnston's force (east of Jackson), was held off by a covering corps under Blair (afterwards under Sherman), and though another unsuccessful assault was made on the 25th of June, resistance was almost at an end. On the 4th of July, the day after, far away in Pennsylvania, the great battle of Gettysburg had closed with Lee's defeat, the garrison of Vicksburg, 37,000 strong, surrendered.

**VICO**

**GIOVANNI BATTISTA** (1668-1744), Italian jurist and philosopher, was born at Naples on the 23rd of June 1668. At the university he made rapid progress, especially in jurisprudence, though preferring the study of history, literature, juridical science and philosophy. Being appointed tutor to the nephews of the bishop of Ischia, G. B. Rocca, he accompanied them to the castle of Vatolla, near Cilento, in the province of Salerno. There he passed nine studious years, chiefly devoted to classical reading. Plato and Tacitus being his favourite authors, because "the former described the ideal man, and the latter man as he really is." On his return to Naples he found himself out of touch with the prevailing Cartesianism, and lived quietly until in 1697 he gained the professorship of rhetoric at the university, with a scanty stipend of 100 scudi. On this he supported a growing family and gave himself to untiring study. Two authors exercised a weighty influence on his mind—Francis Bacon and Grotius. He was no follower of their ideas, indeed often opposed to them; but he derived from Bacon an increasing stimulus towards the investigation of certain great problems of history and philosophy, while Grotius proved valuable in his study of philosophic jurisprudence. In 1708 he published his *De ratione studiorum*, in 1710 *De antiquissima Italorum sapientia, in 1730 De universi juris uno principio et fine uno, and in 1721 De constancia jurisprudent.* Of the first, preferring the study of history, literature, and science to the study of philosophy, he was a candidate for the university chair of jurisprudence, but as he had no personal or family influence was not elected. With calm courage he returned to his poverty and his favourite studies, and in 1725 published the first edition of the work that forms the basis of his renown, *Principii d una sciencia nuova.* In 1730 he produced a second edition of the *Sciencia nuova*, so much altered in style and with so many substantial additions that it was practically a new work. In 1735 Charles III. of Naples marked his recognition of Vico's merits by appointing him historiographer-royal, with a yearly stipend of 100 ducats. Soon after his mind began to give way, but during frequent intervals of lucidity he made new corrections in his great work, of which a third edition appeared in 1744, prefaced by a letter of dedication to Cardinal Trojano Acquaviva. He died on the 20th of January of the same year. Fate seemed to be pursuing him to the last. A fierce quarrel arose over his burial between the brotherhood of the Dominicans to which he had belonged, and the university professors, who desired to escort his corpse to the grave. Finally the canons of the cathedral, together with the professors, buried the body in the church of the Gerolimini.

Vico has been generally described as a solitary soul, out of harmony with the average of his time. But a much closer study of his works shows him to have been thoroughly in touch with them. Owing to the historical past of Naples, and its social and economic condition at the end of the 17th century, the only study that really flourished there was that of law; and this soon penetrated from the courts to the university, and was raised to the level of a science. A great school of jurisprudence was thus formed, including many men of vast learning and great ability, although little known outside their immediate surroundings. Three men, however, obtained a place of some distinction. By disposing of his not unformidable kingdom, based on a study of its laws and institutions and of the legal conflicts between the state and the court of Rome, Pietro Giannone was the initiator of what has been since known as civil law. Giovanni Venuti was distinguished for his apologetic work, especially distinguished for its accuracy and elegance. Vico raised the problem to a higher plane, by tracing the origin of law in the human mind and explaining the historical changes of the one by those of the other. Thus he made the original study of ideas which constitute the modern psychologico-historic method. This problem he proceeded to develop in various works, until in his *Saggio* he arrived at a somewhat complete solution, which may be formulated as follows: If the principle of justice and law be one, eternal and immutable, why should there be so many different codes of legislation? These differences are not caused by difference in the essence of the things, but only by the diverse conception of people, even in that of the Romans. This problem is touched upon in his *Gratissi Inaugural Addresses (Orazioni o Prologhi) and in his Minor Works (Scritti minori).* Finally he applied himself to his solution in his *Universal Lane (Diserbo universale),* which is divided into two books. The first of these, *De uno et universi juris principio et fine uno,* was subdivided into two parts; so like wise was the second, with the respective titles of *De constanza philologica et De constanta jurisprudentia.*

The following is the general idea derived from these researches. Vico held God to be the ruler of the world of nations, but ruling, so to speak, providentially and not absolutely. This is a doctrine, which is ascribed tomiracles, but as He rules nature, by means of natural laws. If, therefore, the physicist seeks to discover the laws of nature by study of natural phenomena, so the philosopher must effectual changes of the human events and of the human mind. According to Vico, law emanates from the conscience of mankind, in whom God has infused a sentiment of justice. A sentiment in which human events and the operations of the human mind, and participates in its changes. This sentiment of justice is at first confused, uncertain and almost instinctive— is, as it were, a divine and religious inspiration instilled by Heaven in the primitive tribes of the earth. It is an unconscious, universal sentiment, not the personal, conscious and rational sentiment of the superior few. Hence the law to which it gives birth is enwrapped in religious forms which are likewise visible and palpable, inasmuch as primitive laws are uninculcated, abstract, philosophical ideas. This law is not the individual work of any philosophical legislator, for no man was, or could be, a legislator at that time. It is first displayed in human nature, and naturally crystallizes into laws or works of history, and is not given as a revealed code, but is the result of collective, in the formation of the conscious mind, and participates in its changes. The names of leading legislators, which we so often find recorded in the history of primitive peoples, are symbols and myths, merely serving to mark an historic period or epoch by some definite and regular terminations, or to distinguish a tribe from another tribes, were then distinguished by personal names only. The first obscure and confused conception of law gradually becomes clearer and better defined. Its visible and religious character is at first retained but slowly replaced by the rational manifestation of the philosophic principles of law that gains the victory in the final stage of development, designated by Vico as that of civil and religious law. This work has been divided into three periods—

1. *De uno et universi juris principio et fine uno,* subdivided into two parts; the first of which being called *Universal Lane (Diserbo universale),* which is divided into two books. The first of these, *De uno et universi juris principio et fine uno,* was subdivided into two parts; so like wise was the second, with the respective titles of *De constanza philologica et De constanta jurisprudentia.*
philosophic law of the third period is assuredly very different in form from the primitive law; but in substance it may be said to have laid the foundation of that more perfect form of justice and the just principle which was vaguely felt in primitive times. Hence one development of law may be easily traced from the other, as the stream may be traced by observing the direction of the current. Vico was able to discover a single and enduring principle (De universi juris una principi et fide uno). On these grounds it has been sought to establish a close relation between Vico and Grotius. The latter clearly shows that there was a sequence between him and Vico. Especially of interest is the fact that, in the treatment of primitive nations and a natural law based on a general and unchanging principle of human nature, and therefore obligatory upon all. But Vico will not have it that the history of law is divisible into two periods. He at least implied that the two are not distinct by reason of their origin, and therefore must be considered as existing in two parallel lines. But Vico maintained that the one was continually progressing towards the other, positive law showing an increasing tendency to draw nearer to natural and rational law. Hence the conception that law is of necessity a spontaneous birth, the creation of any individual legislator; and hence the idea that it necessarily proceeds by a natural and logical process of evolution, constituting its history. Vico may have derived from Comenius the idea of natural law; but his discovery of the historic evolution of law was first suggested to him by his study of Roman law. He saw that the history of Roman jurisprudence was a continuous progress, that the same process may be said to have been followed by those nations and a natural law based on a general and unchanging principle of human nature, and therefore obligatory upon all. The Tables of the Romans, having once been conceived from this point of view, becomes a new element in the history of law, that is, a new element that is not only a model of all ancient Roman law, but a model of all natural law. This principle, as we have seen, is a principle of advance, keeping pace with the progress of civilization, towards the philosophic and natural law founded on the principles of natural law.

As already stated, the Scienza nuova appeared in three different editions. The third may be disregarded; but the first and second editions are almost distinct works. In the former the author sets forth the analytical process by which the laws he discovered were deduced from facts. In the second he not only enlarges his matter and gives multiplied applications of his ideas, but also follows the theory of a priori, that is, the first extinction of the laws that had been discovered and then proving them by the facts to which they are applied. In this edition the fragmentary and jerky arrangement, the intricate style, and a peculiar and often purely conventional terminology seriously checked the diffusion of the work, which accordingly was little studied in Italy and remained almost unknown to the rest of Europe. Its fundamental idea consists in that which Vico, in his peculiar terminology, style "poetic wisdom" (sapientia poe"tica) and occult wisdom (sapiencia riptata), and in the historical process by which the one is merged in the other. He frequently declares that this discovery was the result of a night of intellectual inspiration. Vico was the first thinker who asked, Why have we a science of nature, but no science of history? Because our glance can easily be turned outwards and survey the exterior world; but it is for hard thinking to turn inward and comprehend the being of the spirit. All our errors in explaining the origin of human society arise from our obstinacy in believing that primitive man was entirely similar to ourselves, and that we can judge and live in the same possession of the spirit. We must learn to issue from ourselves, transport ourselves back to other times, and become children again in order to comprehend the infancy of the human race. As in children, imagination and the senses prevailed in those men of the past. They had no abstract ideas; in their minds all was concrete, visible and tangible. All the phenomena, forces and laws of nature, together with mental conceptions, were alike personified. To suppose that all mental conceptions are fables invented by the philosophers is to write history backwards and confound the instinctive, impersonal, poetic wisdom of the primitive age, with the civil wisdom of our own day. But how can we explain the formation of this poetic wisdom, which, albeit the work of ignorant men, has so deep and intrinsic a philosophic value? The only possible reply is that already given when treating of the origin of law. Providence has instilled into the heart of man a sentiment of justice and goodness, of beauty and of truth, that is manifested differently at different times. If we look within us, constituting the inner life, we shall find that poetic wisdom is already present. He does not confine himself to the facts of history into assured reality. For Vico psychology and history were the two poles of the new world he discovered. After having analyzed the system of God's world, he passed on to this world, and showing that the poetical and occult emanation of the human conscience, is almost the product of divine inspiration. From this, by the aid of civilization, reason and philosophy, there is gradually developed the civil, occult wisdom. The continual, slow and laborious process from the one to the other is the law which really constitutes history, and man becomes civilized by reasons which are derived from the possession of all that in poetic wisdom remained imper- unal, unconscious, that came, as it were, from without by divine afflatus. The religion of primitive peoples is no less mythical than their history, since they could only conceive of it by means of myths. On these lines he interprets the whole history of primitive Rome. One book speaks of it as a "noble, tender, poetic, and eloquent dream." It is a "discovery of the True Homer." Why all the cities of Greece dispute the honour of being his birthplace is because the "Iliad" and the "Odyssey" are the key epics of an era. And yet there is the true creation of the Greek people which is in every city of Greece. And because the primitive peoples are unconscious and self-ignorant Homer is represented as being blind. In all parts of history in the age of poetry, Vico holds that the greatest and most profound method, and arrives at safer conclusions. This is the case in Roman history, especially in such portions as related to the history of all races. Here he sometimes attains, even in details, to divisions of the truth afterwards confirmed by new documents and later research. The aristocratic origin of Rome, the struggle between the patricians and the plebeians, the laws of the XII. Tables, not, as tradition has it, imported from Greece, but the natural and spontaneous product of ancient Roman customs, and many other similar theories were discovered by Vico, and expounded with his usual originality, though not always without blunders and exaggerations. Having thus formulated his idea, he made it more general in order to apply it to the history of all nations. From the savage state, through the terror that gives birth to religions, through the creation of the human mind, through the increase in the number of nations, and then the advance of knowledge, he led mankind from the dawn of time to the birth of law. As we witness the growth of the human mind, he was led into increased error by this artificial and arbitrary effort.

It has been justly observed by many that this continuous cyclical movement entirely excludes the progress of humanity towards a better state. It is true, it is not possible; but then it is not true, without being identical, and that, if one might differ from another, the idea of progress was not necessarily excluded by the law of cycles. Vico undoubtedly considered the poetic wisdom of the Middle Ages to be different from that of the Greeks and Romans, and Christianity to be very superior to the pagan religion. But he never investigated the question whether, since there is a law of progressive evolution in the history of different nations, separately examined, there may not likewise be another law ruling the general history of these nations, every one of which must have represented one phase of the world, and of which the laws are divided, according to the periods, into different and independent systems. It is true, although the Scienza nuova cannot be said absolutely to deny the law of progress, it must be allowed that Vico not only failed to solve the problem but even shrank from attacking it.

Vico founded no school, and though during his lifetime and for a while after his death he had many admirers both in Naples and the northern cities, his fame and name were soon obscured, especially as the Kantian system dominated the world of thought. At the present day, however, the name of Vico has been restored to the Italian intellectual world. The Milan called attention to the merits of their great countryman, and his reinstatement was completed by Michelet, who in 1857 translated the Scienza nuova into French. Vico's writings suffer through their author's not having followed a regular course of studies, and his style is very involved. He was a deeply religious man, but his exposition of Jewish origins from the poetic point of view is as important as his other works, due to the conditions of his age, which preceded the dawn of Semitic investigation and regarded the Old Testament and the Hebrew religion as sui generis.

Victor I. was bishop of Rome from about 190 to 198. He submitted to the opinion of the episcopate in the various parts of Christendom the divergence between the Easter usage of Rome and that of the bishops of Asia. The bishops, particularly St Ireneus of Lyons, declared themselves in favour of the usage of Rome, but refused to associate themselves with the excommunication pronounced by Victor against their Asiatic colleagues. At Rome Victor excommunicated Theodotus of Byzantium on account of his doctrine as to the person of Christ. St Jerome attributes to Victor some episcula in Latin, which are believed to be in certain apocryphal treatises of St Cyprian.

Victor II., the successor of Leo IX., was consecrated in St Peter's, Rome, on the 13th of April 1055. His father was a Swabian baron, Count Hartwig von Calw, and his own baptismal name was Gebhard. At the instance of Gebhard, bishop of Regensburg, uncle of the emperor Henry III., he had been appointed while still a young man to the see of Eichstätt; in this position his great talents soon enabled him to render important services to Henry, whose chief adviser he undoubtedly became. His nomination to the papacy by Henry, at Mainz, in September 1056, was made at the instance of a Roman deputation headed by Hildebrand, whose policy doubtless was to detach from the imperial interest one of its ablest supporters. In June 1055 Victor met the emperor at Florence, and held a council, which anew condemned clerical marriages, simony and the alienation of the estates of the church. In the following year he was summoned to Germany to the side of the emperor, and was with him when he died at Botfeld in the Harz on the 5th of October 1056. As guardian of Henry's infant son, and adviser of the empress Agnes, Victor now wielded enormous influence, which to a great degree was due to the maintenance of peace throughout the empire and for strengthening the papacy against the aggressions of the barons. He died shortly after his return to Italy, at Arezzo, on the 28th of July 1057. His successor was Stephen IX. (Frederick of Lorraine).

Victor III. (Dauferius Epifani), pope from the 24th of May 1056 to the 16th of September 1057, was the successor of Gregory VII. He was a son of Landolfo V., prince of Benevento, and was born in 1027. After studying in various monasteries he became provost at St Benedict at Capua, and in 1055 obtained permission from Victor II. to enter the cloister at Monte Cassino, changing his name to Desiderius. He succeeded Stephen IX. as abbot in 1057, and his rule marks the golden age of that celebrated monastery; he promoted literary activity, and established an important school of mosaic. Desiderius was created cardinal priest of Sta Cecilia by Nicholas II. in 1059, and as papal vicar in south Italy conducted frequent negotiations between the Normans and the pope. Among the four men suggested by Gregory VII. on his death-bed as most worthy to succeed him was Desiderius, who was favoured by the cardinals because of his connection with the Normans and his diplomatic ability. The abbot, however, declined the papal crown, and the year 1058 passed without an election. The cardinals at length proclaimed him pope against his will on the 24th of May 1058, but he was driven from Rome by imperialists before his consecration was complete, and, laying aside the papal insignia at Terracina, he retired to his beloved monastery. As vicar of the Holy See he convened a synod at Capua on the 7th of March 1057, resumed the papal insignia on the 21st of March, and received tardy consecration at Rome on the 9th of May. Owing to the presence of the antipope, Clement III. (Guibert of Ravenna), who had powerful partisans, his stay at Rome was brief. He sent an army to Tunis, which defeated the Saracens and compelled the sultan to pay tribute to the papal see. In August 1057 he held a synod at Benevento, which renewed the excommunication of Guibert; banned Archbishop Hugo of Lyons and Abbot Ricard of Marseilles as schismatics; and confirmed the prohibition of lay investiture. Falling ill at the synod, Vicar returned to Monte Cassino, where he died on the 16th of September 1057. He was buried at the monastery and is accounted a saint by the Benedictine order. His successor was Urban II.

Victor III., while abbot of Monte Cassino contributed personally to the literary activity of the monastery. He wrote Dialogi de miraculis S. Benedicti, which, along with his Epistolae, are printed by P. Migne, Patrol. Lat. vol. 149, and an account of the miracles of Leo IX. (In Acta Sanctorum, 19th of April). The chief sources for his life are the "Chronica monasterii Cassinensis," in the Mon. Germ. hist. Script. vii., and the Vita in P. Migne, Patrol. Lat. vol. 149, and in J. M. Watterich, Pontif. Roman. Vite.

Victor IV. was a title taken by two antipopes. (1) Gregorio Conti, cardinal priest of Santi Dodi Apostoli, was chosen by a party opposed to Innocent II. in succession to the antipope Anacletus II., on the 15th of March 1138, but through the influence of Bernard of Clairvaux he was induced to make his submission on the 29th of May. (2) Octavian, count of Tusculum and cardinal deacon of St Nicola in carcere Tulliano, the Ghibelline antipope, was elected at Rome on the 7th of September 1159, in opposition to Alexander III., and supported by the emperor Frederick Barbarossa. Consecrated at Farfa on the 4th of October, Victor was the first of the series of antipopes supported by Frederick against Alexander III. Though the excommunication of Frederick by Alexander in March 1160 made only a slight impression in Germany, this pope was nevertheless able to gain the support of the rest of western Europe, because since the days of Hildebrand the pope of the day was in the fullest sense the 'man of the hour. In the fourteenth century the kings of France and of England could not view with indifference a revival of such imperial control of the papacy as had been exercised by the emperor Henry III. He died at Lucca on the 20th of April 1164 and was succeeded by the antipope Paschal III. (1164-1168).

See M. Meyer, Die Wahl Alexanders III. und Victor IV. 1159 (Göttingen, 1871); and A. Hauck, Kirchengeschichte Deutschlands, Band iv. (C. H. Ha.)

VICTOR, GAUDIUS JULIUS (4th cent. a.d.), Roman writer on rhetoric, possibly of Gallic origin. His extant manual (in C. Halm's Rhetores Latini Minores, 1863) is of some importance as facilitating the textual criticism of Quintilian, whom he closely follows in many places.

VICTOR, SEXTUS AURELIUS, prefect of Pannonia about 360 (Amm. Marc. xxi. 10), possibly the same as the consul (jointly with Valentinian) in 373 and as the prefect of the city who is mentioned in an inscription of the time of Theodosius. Four small historical works have been ascribed to him on more or less doubtful grounds—(1) Orig. Gentis Romanae, (2) De Viribus Illustribus Roman, (3) De Caesaribus, (4) De Vita & Moribus Imperatorum Romanorum excerpta ex Libris Sex. Aur. Victoris. The four have generally been published together under the name Historia Romana, but the fourth piece is a retouched of the third. The first piece was first printed at Naples about 1472, in 40, under the name of Pliny (the younger), and the fourth at Strassburg in 1505.

The first edition of all four was that of A. Schottus (Flo, Antwerp, 1579). The most recent edition of De Caesaribus is by F. Pichlmayr (Münich, 1892).
VICTOR AMEDEUS II.—VICTOR EMMAUUEL II.

VICTOR AMEDEUS II. (1666-1732), duke of Savoy and first king of Sardinia, was the son of Duke Charles Emmanuel II. and Jeanne de Savoie-Nemours. Born at Turin, he lost his father in 1675, and spent his youth under the regency of his mother, known as “Madame Reale” (madame royale), an able but ambitious and overbearing woman. He assumed the reins of government at the age of sixteen, and married Princess Anne, daughter of Philip of Orleans and Henrietta of England, and niece of Louis XIV., king of France. That sovereign was determined to dominate the young duke of Savoy, who from the first set against the monarch’s insolent bearing. In 1685 Victor was forced by Louis to persecute his Waldensian subjects, because they had given shelter to the French Huguenot refugees after the revocation of the edict of Nantes. With the unwelcome help of a French army under Marshal Catatin, he invaded the Waldensian valleys, and after a difficult campaign, characterized by great cruelty, he subjugated them. Nevertheless, he became more anxious than ever to emancipate himself from French thraldom, and his first sign of independence was given in 1688, when he adhered to the Protestant faction at Turin, and in 1689, where he conferred on political affairs with Prince Eugène of Savoy and other personages, without consulting Louis. About this time the duke plunged into a whirl of dissipation, and chose the beautiful but unscrupulous Contessa di Verrua as his mistress, neglecting his faithful and devoted wife. Louis having discovered Victor’s intrigues with the emperor, tried to precipitate hostilities by demanding his participation in a second expedition against the Waldensians. The duke unwillingly complied, but when the French entered Piedmont and demanded the cession of the fortresses of Turin and Verrua, he refused, and while still professing to negotiate with Louis, joined the league of Austria, Spain and Venice. War was declared in 1690, but at the battle of Staffarda (18th of August 1691), Victor, in spite of his great courage and skill, was defeated by the French under Catatin. Other reverses followed, but the attack on Cuneo was heroically repulsed by the citizens. The war dragged on with varying success, until the severe defeat of the allies at Marsiglia and their selfish neglect of Victor’s interests induced him to open negotiations with France once more. Louis agreed to restore most of the fortresses he had captured and to make other concessions; a treaty was signed in 1696, and Victor appointed generalissimo of the Franco-Piedmontese forces in Italy operating against the imperialists. By the treaty of Ryswick (1697) a general peace was concluded. On the outbreak of the war of the Spanish Succession in 1700 the duke was again on the French side, but the insolence of Louis and of Philip V. of Spain towards him induced him, at the end of the two years for which he had bound himself to them, to go over to the imperialists (1704). At first the French were successful and captured several Piedmontese fortresses, but after besieging Turin, which was skilfully defended by the duke, for several months, they were completely defeated by Victor and Prince Eugène of Savoy (1706), and eventually driven out of the other towns they had captured. By the peace of Utrecht (1713) the Powers conferred the kingdom of Sicily on Victor Amedeus, whose government proved efficient and at first popular. But after a brief stay in the island he returned to Piedmont and left his new possessions to a viceroy, which caused much discontent among the Sicilians; and when the Quadruple Alliance decreed in 1718 that Sicily should be restored to Spain, Victor was unable to offer any opposition, and had to content himself with receiving Sardinia in exchange.

The last years of Victor Amedeus’s life were saddened by domestic troubles. In 1715 his eldest son died, and in 1728 he lost his queen. After her death, much against the advice of his remaining son and heir, Carlino (afterwards Charles Emmanuel III.), he married the Contessa di San Sebastiano, whom he created Marchesa di Spigno, abdicated the crown and retired to Chambéry to end his days (1730). But his second wife, an ambitious intrigante, soon tired of her quiet life, and induced him to return to the court and resume the crown, which he became in 1731.

This led to a quarrel with his son, who with quite unnecessary harshness, partly due to his minister the Marchési d’Ormea, arrested his father and confined him at Rivoli and later at Moncalieri; there Victor, overwhelmed with sorrow, died on the 31st of October 1732.

Victor Amedeus, although accused not without reason of bad faith in his diplomatic dealings and of cruelty, was undoubtedly a great soldier and a still greater administrator. He not only won for his country a high place in the council of nations, but he doubled its revenues and increased its prosperity and industries, and also emphasized its character as an Italian state. His infidelity to his wife and his harshness towards his son Carlino are blemishes on a splendid career, but he more than expiated these faults by his tragic end.

See D. Carutti, Storia del Regno di Vittorio Amedeo II. (Turin, 1886); and E. Parri, Vittorio Amedeo II. ed Eugenio di Savoia (Milan, 1888). The Romance of Italy (London, 1905), is based on original authorities, and is the most complete monograph on the subject.

VICTOR EMMAUUEL II. (1820-1878), king of Sardinia and first king of Italy, was born at Turin on the 14th of March 1820, and was the son of Charles Albert. He once married a Marchesa di Carignano, who became king of Sardinia in 1821. Brought up in the bigoted and chilling atmosphere of the Piedmontese court, he received a rigid military and religious training, but little intellectual education. In 1842 he was married to Adelaide, daughter of the Austrian Archduke Rainer, as the king desired at that time to improve his relations with Austria. The young couple led a somewhat dreary life, hidebound by court etiquette, which Victor Emmanuel hated. He played no part in politics during his father’s lifetime, but took an active interest in military matters. When the war with Austria broke out in 1848, he was delighted at the prospect of distinguishing himself, and was given the command of a division. At Goito he was slightly wounded and displayed great bravery, and after Custozza defended the rearguard to the last (25th of July 1848). In the campaign of March 1849 he commanded the same division. After the disastrous defeat at Novara on the 23rd of March, Charles Albert, having rejected the peace terms offered by the Austrian field-marshall Radetzky, abdicated in favour of his son, and withdrew to a monastery in Portugal, where he died a few months later. Victor Emmanuel repaired to Radetzky’s camp, where he was received with every sign of respect, and the field-marshall offered not only to waive the claim that Austria should occupy a part of Piedmont, but to give him an extension of territory, provided he revoked the constitution and substituted the old blue Piedmontese flag for the Italian tricolour, which savoured too much of revolution. But although the young king had not yet sworn to observe the charter, and in any case the other Italian princes had all violated their constitutional promises, he rejected the offer. Consequently he had to face the temporary Austrian occupation of the territory comprised within the Po, the Sesia and the Ticino, and of half the citadel of Alessandria, to disband his Lombard, Polish and Hungarian volunteers, and to withdraw his fleet from the Adriatic; but he secured an amnesty for all the Lombards compromised in the recent revolution, having even threatened to go to war again if they were not granted. It was the maintenance of the constitution in the face of the overwhelming tide of reaction that established his position as the champion of Italian freedom and earned him the sobriquet of Re Galantuomo (the honest king). But the task entrusted to him was a most difficult one: the army disorganized, the treasury empty, the people despondent if not actively disloyal, and he himself reviled, misunderstood, and, like his father, accused of treachery. Parliament having rejected the peace treaty, the king dissolved the assembly; in the famous proclamation from Moncalieri he appealed to the people’s loyalty, and the new Chamber ratified the treaty (9th of January 1850). This same year, Cavour (q.v.) was appointed minister of agriculture in D’Azeglio’s cabinet, and in 1852, after the fall of the Ricasoli ministry, became his successor in the post which with brief interruptions he held until his death.

In having Cavour as his chief adviser Victor Emmanuel was
most fortunate, and but for that statesman's astounding diplomatic genius the liberation of Italy would have been impossible. The years from 1829 to 1859 were devoted to restoring the shattered finances of Sardinia, reorganizing the army and modernizing the antiquated institutions of the kingdom. Among other reforms the abolition of the foro ecclesiastico (privileged ecclesiastical courts) brought down a storm of hostility from the Church both on the king and on Cavour, but the latter remained unshaken. He was in command of the civil power. When the Crimean War broke out, the king strongly supported Cavour in the proposal that Piedmont should join France and England against Russia so as to secure a place in the councils of the great Powers and establish a claim on them for eventual assistance in Italian affairs (1854). The following year Victor Emmanuel was stricken with a threefold family misfortune; for his mother, the Queen Dowager Maria Teresa, his wife, Queen Adelaide, and his brother Ferdinand, duke of Genoa, died within a few weeks of each other. The clerical party were not slow to point this circumstance out to the king, who, for the sake of his policies, usually remained princely calm even in the face of heavy disaster. At the end of 1855, while the allied troops were still in the East, Victor Emmanuel visited Paris and London, where he was warmly welcomed by the emperor Napoleon III. and Queen Victoria, as well as by the peoples of the two countries.

Victor Emmanuel's object now was the expulsion of the Austrians from Italy and the expansion of Piedmont into a North Italian kingdom, but he did not regard the idea of Italian unity as coming within the sphere of practical politics for the time being, although a movement to that end was already beginning to gain ground. He was in command of the military, as well as of some of the conspirators, especially with La Farina, the leader of the Società Nazionale, an association the object of which was to unite Italy under the king of Sardinia, and he even communicated with Mazzini and the republicans, both in Italy and abroad, whenever he thought that they could help in the expulsion of the Austrians from Italy. In 1859 Cavour's diplomacy succeeded in drawing Napoleon III. into an alliance against Austria, although the king had to agree to the cession of Savoy and possibly of Nice and to the marriage of his daughter Clothilde to Prince Napoleon. These conditions were judged by the king for what they deemed his sacrilegious policy. At the end of 1855, while the allied troops were still in the East, Victor Emmanuel visited Paris and London, where he was warmly welcomed by the emperor Napoleon III. and Queen Victoria, as well as by the peoples of the two countries.

which served to embitter Austro-Italian relations. On the 9th of January 1878, Victor Emmanuel died of fever in Rome, and was buried in the Pantheon. He was succeeded by his son Humbert.

Bluff, hearty, good-natured and simple in his habits, yet he always had a high idea of his own kingly dignity, and his really statesmanlike qualities often surprised foreign diplomats, who were deceived by his homely exterior. As a soldier he was very brave, but he did not show great qualities as a military leader in the campaign of 1866. He was a keen sportsman and would spend many days at a time pursuing chamois or steinbock in the Alpine fastnesses of Piedmont with nothing but bread and cheese to eat. He always used the dialect of Piedmont when conversing with natives of that country, and he had a vast fund of humorous anecdotes and proverbs with which to illustrate his arguments. He had a great weakness for female society, and kept several mistresses; one of them, the beautiful Rosa Vercellone, he created Countess Mirafiore e Fontanafreda and married morganatically in 1869; she bore him a son.

**BIBLIOGRAPHY.**—Besides the general works on Italy and Savoy see V. Bersezio, _Il Regno di Vittorio Emanuele II._ (8 vols., Turin, 1869); G. Massari, _La Vita ed il Regno di Vittorio Emanuele II._ (2 vols., Milan, 1878); N. Bianchi, _Storia della Diplomatica Europea in Italia_ (8 vols., Turin, 1865). (L. V.)

**VICTOR EMMANUEL III.** (1869–), king of Italy, son of King Humbert I. and Queen Margherita of Savoy, was born at Naples on the 11th of November 1869. Carefully educated by his mother and under the direction of Colonel Osio, he owed his elementary education to his mother and his military and horsemanship and military exercises. Entering the army at an early age he passed through the various grades and, soon after attaining his majority, was appointed to the command of the Florence Army Corps. During frequent journeys to Germany he enlarged his military experience, and upon his appointment to the command of the Naples Army Corps in 1896 displayed sound military and administrative capacity. A keen huntsman, and passionate fond of the sea, he extended his yachting and hunting excursions as far east as Syria and as far north as Spitsbergen. As representative of King Humbert II. he attended the coronation of Tsar Nicholas II. in 1896, the Victorian Jubilee celebrations of 1897, and the festivities connected with the coming of age of the German crown prince in 1900. The prince's intellectual and artistic leanings were well known; in particular, he has made a magnificent collection of historic Italian coins, on which subject he became a recognized authority. At the time of the assassination of his father, King Humbert (the 29th of July 1900), he was returning from a yachting cruise in the eastern Mediterranean. Landing at Reggio di Calabria he hastened to Monza, where he conducted with firmness and tact the preparations for the burial of King Humbert and for his own formal accession, which took place on the 9th and 11th of August 1900. On the 24th of October 1896 he married Princess Elena of Montenegro, who, on the 1st of June 1901, bore him a daughter named Yolanda Margherita, on the 10th of November 1902 a second daughter named Mafalda, and on the 15th of September 1904 a son, Prince Humbert.

**VICTORIA [ALEXANDRINA VICTORIA].** Queen of the United Kingdom of Great Britain and Ireland, Empress of India (1819–1901), only child of Edward, duke of Kent, fourth son of King George III., and of Princess Victoria Mary Louisa of Saxe-Coburg-Gotha (widow of Prince Emich Karl of Leiningen, by whom she already had two children), was born at Kensington Palace on the 24th of May 1819. The duke and duchess of Kent had been living at Amorbach, in Franconia, owing to their strained circumstances, but they returned to London on purpose that their child should be born in England. In 1817 the death of Princess Charlotte (only child of the prince regent, afterwards George IV., and of the Prince Leopold of Saxe-Coburg-Gotha, afterwards king of the Belgians), had left the ultimate succession to the throne of England. In the younger generation, so uncertain that the three unmarried sons of George III., the dukes of Clarence (afterwards William IV.), Kent and Cambridge, all married in the following year, the two elder on the same day. All three had children, but the duke of Clarence's two baby daughters died in infancy, in 1819 and 1821; and the duke of Cambridge's son George, born on the 26th of March 1819, was only two months old when the birth of the duke of Kent's daughter put her before him in the line of succession. As to what name the child should bear was not settled without bickerings. The duke of Kent wished her to be christened Elizabeth, and the prince regent wanted Georgiana, while the tsar Alexander I., who had promised to stand sponsor, stipulated for Alexandrina. The baptism was performed in a drawing-room of Kensington Palace on the 24th of June by Dr Manners Sutton, archbishop of Canterbury. The prince regent, who was present, named the child Alexandrina; then, being requested by the duke of Kent to give a second name, he said, rather abruptly, "Let her be called Victoria, after her mother, but this name must come after the other." Six weeks after her christening the princess was vaccinated, this being the first occasion on which a member of the royal family underwent the operation.

In January 1820 the duke of Kent died, five days before his brother succeeded to the throne as George IV. The widowed duchess of Kent was now a woman of thirty-four, handsome, homely, a German at heart, and with little liking for English ways. But she was a woman of experience, and shrewd; and fortunately she had a safe and affectionate adviser in her brother, Prince Leopold of Coburg, afterwards (1831) king of the Belgians, who as the husband of the late Princess Charlotte had been a most able and experienced regent of the young prince.

Besides the general works on Italy and Savoy see V. Bersezio, _Il Regno di Vittorio Emanuele II._ (8 vols., Turin, 1869); G. Massari, _La Vita ed il Regno di Vittorio Emanuele II._ (2 vols., Milan, 1878); N. Bianchi, _Storia della Diplomatica Europea in Italia_ (8 vols., Turin, 1865). (L. V.)

In August 1831, in a discussion in parliament upon a grant of £10,000 to the widow of King William IV. of £6000 to Princess Charlotte and £4000 to Elizabeth as “more accordant to the feelings of the people”; and the idea of a change seems to have been powerfully supported. In 1836 William IV. approved of a proposal to change it to Charlotte; but, to the princess's own delight, it was given up.

The question of her name, as that of one who was to be queen, remained even up to her accession to the throne a much-debated one. In August 1831, in a discussion in parliament upon a grant of £10,000 to the widow of King William IV. of £6000 to Princess Charlotte and £4000 to Elizabeth as “more accordant to the feelings of the people”; and the idea of a change seems to have been powerfully supported. In 1836 William IV. approved of a proposal to change it to Charlotte; but, to the princess's own delight, it was given up.
by her first husband, and she became teacher to the Princess Victoria when the latter was five years old. George IV. in 1827 made her a baroness of Hanover, and she continued as lady-in-
attendance after the death of Northumberland was appointed official governess in 1830, but actually performed the functions first of governess and then of private secretary till 1842, when she left the court and returned to Germany, where she died in 1870. The Rev. George Davys, afterwards bishop of Peter-
borough, taught the princess Latin; Mr. J. B. Sale, music;
Mr Westall, history; and Mr Thomas Steward, the writing
master of Westminster School, instructed her in penmanship.
In 1830 George IV. died, and the duke of York (George III.'s second son) having died childless in 1827, the duke of Clarence became king as William IV. Princess Victoria now became the direct heir to the throne. William IV. cherished affectionate feelings towards his niece; unfortunately he took offence at the death of Kent for declining to let her child come and live at his court for several months in each year, and through the whole of his reign there was strife between the two; and Prince Leopold was no longer in England to act as peacemaker.
In the early hours of the 20th of June 1837, William IV. died. His thoughts had dwelt often on his niece, and he repeatedly said that he was sure she would be "a good woman and a good
queen. It will touch every sailor's heart to have a girl queen to fight for. They'll be tattooing her face on their arms, and I'll be bound they'll all think she was christened after Nelson's
ship." Dr Howley, archbishop of Canterbury, and the marquis of Conyngham, bearing the news of the king's death, started in a hired coach for Windsor Victoria, which was reached at five o'clock. Their servants rang, knocked and thumped; and when at last admittance was gained, the prince and the marquis were shown into a lower room and there left to wait. Presently a maid appeared and said that the Princess Victoria was "in a sweet sleep and could not be disturbed." Dr Howley, who was nothing if not pompous, answered that he had come on state business, to which everything, even sleep, must give place. The princess was accordingly roused, and quickly came downstairs in a dressing-gown, her fair hair flowing loose over her shoulders. Her own account of this interview, written the same day in her journal (Letters, i. p. 97), shows her to have been quite prepared.
The privy council assembled at Kensington in the morning; and the usual oaths were administered to the queen by Lord Chancellor Cottenham, after which all present did homage. There was a touching incident when the queen's uncles, the dukes of Cumberland and Sussex, two old men, came forward to perform their obsequies. The queen blushed, and descending from her throne, kissed them both, without allowing them to kneel. By the death of William IV., the duke of Cumberland had become King Ernest of Hanover, and immediately after the ceremony he made haste to reach his kingdom. Had Queen Victoria died without issue, this prince, who was arrogant, ill-tempered and rash, would have become king of Great
Britain; and, as nothing but mischief could have resulted from this, the young queen's life became very precious in the sight of her people. She, of course, retained the late king's ministers in their offices, and it was under Lord Melbourne's direction that the privy council drew up their declaration to the kingdom. This document described the queen as Alexandra Victoria, and all the peers who subscribed the role in the House of Lords on the 20th of June swore allegiance to her under those names. It was not till the following day that the sovereign's style was altered to Victoria simply, and this necessitated the issuing of a new declaration and a re-signing of the peers' role. The public proclamation of the queen took place on the 21st at St James's Palace with great pomp.
The queen opened her first parliament in person, and in a well-written speech, which she read with much feeling, adver-
ted to her youth and to the necessity which existed for her being guided by enlightened advisers. When both houses had voted loyal addresses, the question of the Civil List was considered, and a week or two later a message was brought to parliament requesting an increase of the grant formerly made to the duchess of Kent. Government recommended an addition of £30,000 a year, which was voted, and before the close of the year a Civil
List Bill was passed, settling £38,500 a year on the queen.
The duchess of Kent and her brothers, King Leopold and the
duke of Saxe-Coburg-Gotha, had always hoped to arrange that the queen should marry her cousin, Albert (p.r.) of Saxe-Coburg.
and the prince himself had been made acquainted with this plan from his earliest years. In 1836 Prince Albert, who was born in the same year as his future wife, had come on a visit to England with his father and with his brother, Prince Ernest, and his handsome face, gentle disposition and playful humour had produced a favourable impression on the princess. The
duchess of Kent had communicated her projects to Lord Mel-
bourne, and they were known to many other statesmen, and to persons in society; but the gossip of drawing-rooms during the years 1837-38 continually represented that the young queen
had fallen in love with Prince This or Lord That, and the more imaginative habiters hinted at post-chaises waiting outside Ken-
sington Gardens in the night, private marriages and so forth.
The coronation took place on the 28th of June 1838. No more touching ceremony of the kind had ever been performed in Westminster Abbey. Anne was a middle-aged married woman at the time of her coronation; she waddled and wheezed, and made no majestic appearance upon her throne. Mary was odious to her Protestant subjects, Eliza-
tho to those of the unformed religion, and both these queens succeeded to the crown in times of general sadness; but the
queenVictoria had no enemies except a few Chartists, and the land was peaceful and prosperous when she began to reign over it. The cost of George IV.'s coronation amounted to £240,000; that of William IV. had amounted to £50,000 only; and in asking £70,000 the government had judged that things could be done with suitable luxury, but without waste. The
traditional banquet in Westminster Hall, with the throwing down of the glove by the king's champion in armour, had been dispensed with at the coronation of William IV., and it was
not resolved to revive it. But it was arranged that the sove-
reign's procession to the abbey through the streets should be
the finer show than on previous occasions; and it drew to
London 400,000 country visitors. Three ambassadors for different reasons became objects of great interest on the occasion. Marshal Soulit, Wellington's old foe, received a hearty popular welcome as a military hero; Prince Esterhazy, who represented Austria, dazzled society by his Magyar uniform, which was encircled all over, even to the boots, with pearls and diamonds; while the Turkish ambassador, Sarim Efendi, caused much diversion by his bewilderment. He was so wonder-struck that he could not walk to his place of seating as if he had lost his senses, and kept muttering, "All this for a woman?"
Within a year the court was brought into sudden disfavour with the country by two events of unequal importance, but both exciting. The first was the case of Lady Flora Hastings.
In February 1839 this young lady, a daughter of the
marquis of Hastings, and a maid of honour to the
duchess of Kent, was accused by certain ladies of the
bedchamber of immoral conduct. The charge having been laid before Lord Melbourne, he communicated it to Sir James
Clark, the queen's physician, and the result was that Lady Flora
was subjected to the indignity of a medical examination, which
while it cleared her character, seriously affected her health.
In fact, she died in the following July, and it was then discovered
that the physical appearances which first provoked suspicion
against her had been due to enlargement of the liver. The
queen's conduct towards Lady Flora was kind and sisterly
from the beginning to the end of this painful business; but the scandal was made public through some indignant letters which the marchioness of Hastings addressed to Lord Melbourne
praying for the punishment of her daughter's traducers, and the
general opinion was that Lady Flora had been grossly treated at the instigation of some private court enemies. While the agitation about the affair was yet unappeased, the political
crisis known as the "Bedchamber Plot" occurred. The Whig ministry had introduced a bill suspending the Constitution of Jamaica because the Assembly in that colony had refused to adopt the Prisons Act passed by the Imperial Legislature. Sir Robert Peel made an amendment, which, on a division (6th May), was defeated by a majority of five only in a house of 383, and ministers thereupon resigned. The duke of Wellington was first sent for, but he advised that the task of forming an administration should be entrusted to Sir Robert Peel. Sir Robert was ready to form a cabinet in which the duke of Wellington, Lords Lyndhurst, Aberdeen and Stanley, and Sir James Graham would have served; but he stipulated that the mistress of the bedchamber, the Marchioness ofدنwick-Nairn, should be allowed to have a prominent position in the Whig administration should be removed, and to this the queen would not consent. On the 10th of May she wrote curtly that the course proposed by Sir Robert Peel was contrary to usage and repugnant to her feelings; the Tory leader then had to inform the House of Commons that, having failed to obtain the proof which he desired of her majesty's confidence, it was impossible for him to accept office. The ladies of the bedchamber were so unpopular in consequence of their behaviour to Lady Flora Hastings that the public took alarm at the notion that the queen might be fallen into the hands of an intriguing coterie; and Lord Melbourne, who was anxious about the strength of court favour, resumed office with diminished prestige. The Tories thus felt aggrieved; and the Chartists were so prompt to make political capital out of the affair that large numbers were added to their ranks. On the 14th of June Mr Attwood, M.P. for Birmingham, presented to the House of Commons a Chartist petition alleged to have been signed by 1,280,000 people. It was a cylinder of parchment of about the diameter of a coach-wheel, and was literally rolled up on the floor of the house. On the day after this curious document had furnished both amusement and uneasiness to the Commons, the coterie of the women, whose name as Sophia Elizabeth Guelph Sims, made application at the Mansion House for advice and assistance to prove herself the lawful child of George IV. and Mrs Fitzherbert; and this incident, trumpery as it was, added fuel to the disloyal flame then raging. Going in state to Ascot the queen was hissed by some ladies as her carriage drove on to the course, and two peeresses, one of them a Tory duchess, were openly accused of this unseemly act. Meanwhile some monster Chartist demonstrations were being organized, and they commenced on the 4th of July. At Birmingham, it was an unmixed coincidence that Lady Flora Hastings died on the 5th of July, for though she repeated on her deathbed, and wished it to be published, that the queen had taken no part whatever in the proceedings which had shortened her life, it was remarked that the ladies who were believed to have persecuted her still retained the sovereign's favour. The riots at Birmingham lasted ten days, and had to be put down by armed force. They were followed by others at Newcastle, Manchester, Bolton, Chester and Macclesfield.

This troubled events had the effect of hastening the queen's marriage. Lord Melbourne ascertained that the queen's drop in popularity and the change in her disposition towards her cousin, Prince Albert, were both unalterable, and he advised King Leopold, through M. van der Weyer, the Belgian minister, that the prince should come to England and press his suit. The prince arrived with his brother on a visit to Windsor on the 10th of October 1839. On the 12th the queen wrote to King Leopold:

"Albert's beauty is most striking, and he is so amiable and unaffected—in short, very fascinating." On the 17th all was settled; and the queen wrote to her uncle, "I love him more than words can express." The queen's public announcement of her betrothal was enthusiastically received. But the rule on end was still in force, and still had some parliamentary mortifications to undergo. The government proposed that Prince Albert should receive an annuity of £50,000, but an amendment of Colonel Slithorpe—a politician of no great repute—for making the annuity £50,000 was carried against ministers by 262 votes to 158, the Tories and Radicals going into the same lobby, and many ministerialists taking no part in the division. Prince Albert had not been described, in the queen's declaration to the privy council, as a Protestant prince; and Lord Palmerston was obliged to ask Baron Stockmar for assurance that Prince Albert did not belong to any sect of Protestants whose rules might prevent him from taking the Sacrament according to the ritual of the English Church. He got an answer couched in somewhat ironical terms to the effect that Protestantism owed its existence in a measure to the house of Saxony, from which the prince descended, seeing that this house and that of the landgrave of Hesse had stood quite alone against Europe in upholding Luther and his cause. Even after this certain High Churchmen held that a Lutheran was a "disserter," and that the prince should be asked to subscribe to the Thirty-nine Articles.

The queen was particularly concerned by the question of the prince's future status as an Englishman. It was impracticable for him to receive the title of king consort; but the queen naturally desired that her husband should be placed by act of parliament in a position which would secure to him precedence, not only in England, but in foreign courts. Lord Melbourne sought to effect this by a clause introduced in a naturalization bill; but he found himself obliged to drop the clause, and to leave the queen to confer what precedence she pleased by her own act. The proposal was not without difficulty, for the queen could only confer precedence within her own realms, whereas an act of parliament bestowing the title of prince consort would have made the prince's right to rank above all royal imperial highnesses quite clear, and would have left no room for such disputes as afterwards occurred when foreign princes chose to treat Prince Albert as having mere courtesy rank in his wife's kingdom. The result of these political difficulties was to make the queen more than ever disgusted with the Tories. But there was no other flaw in the happiness of the marriage, which was solemnized on the 11th of February 1840, at the chapel in St James'. It is interesting to note that the queen was dressed entirely in articles of British manufacture. Her dress was of Spitalfields silk; her veil of Honiton lace; her ribbons came from Coventry; even her gloves had been made in London of English kid—a novel thing in days when the French had a monopoly in the finer kinds of gloves.

From the time of the queen's marriage the crown played an increasingly active part in the affairs of state. Previously, ministers had tried to spare the queen all disagreeable and fatiguing details. Lord Melbourne saw her every day, whether she was in London or at Windsor, and he used to explain all current business in a benevolent, chatty manner, which offered a pleasant contrast to the style of his two principal colleagues, Lord John Russell and Lord Palmerston. A statesman of firmer mould than Lord Melbourne would hardly have succeeded so well as he did in making rough places smooth for Prince Albert. Lord John Russell and Lord Palmerston were naturally jealous of the prince's interference—and of King Leopold's and Baron Stockmar's—in state affairs; but Lord Melbourne took the common-sense view that a husband will control his wife whether people wish it or not. Ably advised by his private secretary, George Anson, and by Stockmar, the prince thus soon took the de facto place of the sovereign's private secretary, though he had no official status as such; and his system of classifying and annotating the queen's papers and letters resulted in the preservation of what the editors of the Letters of Queen Victoria (1907) describe as "probably the most extraordinary collection of state documents in the world"—those up to 1861 being contained in between 500 and 600 bound volumes at Windsor. To confer on Prince Albert this role of government conscience was to make him gradually into public favour by his own tact, was the advice which Lord Melbourne gave; and the prince acted upon it so well, avoiding every appearance of intrusion, and treating men of all parties and degrees with urbanity, that within five months of his marriage he obtained a signal mark of the public confidence. In expectation of the queen becoming a mother, a bill was passed through parliament providing for the appointment of Prince Albert as sole regent in case the
queen, after giving birth to a child, died before her son or daughter came of age.

The Regency Bill had been hurried on in consequence of the attempt of a crazy actor, Edward Oxford, to take the queen’s life.

On 10th June 1840, the queen and Prince Albert were driving up Constitution Hill in an open carriage, when Oxford fired two pistols, the bullets from which flew, it is said, close by the prince’s head. He was arrested on the spot, and when his lodgings were searched a quantity of powder and shot was found, with the rules of a secret society, called “Young England,” whose members were pledged to murder, “carrying swords and pistols and wearing mask.” These discoveries raised the surmise that Oxford was the tool of a widespread Chartist conspiracy, or, as the Irish press put it, a conspiracy of Orange-gang to set the duke of Cumberland on the throne; and while these delusions were fresh, they threw well-disposed persons into a paroxysm of loyalty. Even the London street dogs, as Sydney Smith said, joined with O’Connell in barking “God save the Queen.” Oxford seems to have been craving for notoriety; but it may be doubted whether the jury who tried him did right to pronounce him an acquittal on the ground of insanity. He feigned madness at his trial, but during the forty years of his subsequent confinement at Bedlam, he talked and acted, like a rational being, and on the queen was at length released and sent to Australia, where he earned his living there as a house painter, and used to declare that he had never been mad at all. His acquittal was to be deprecated as establishing a dangerous precedent in regard to outrages on the sovereign. It was always Prince Albert’s opinion that if Oxford had been flogged the attempt of Francis on the queen in 1842 and of Bean in the same year would never have been perpetrated. After the attempt of Bean—who was a hunchback, really insane—parliament passed a bill empowering judges to order whipping as a punishment for those who Minh the queen; but some how his life was never enforced. In 1850 a half-pay officer, named Pate, assaulted the queen by striking her with a stick, and crushing her bonnet. He was sentenced to seven years’ transportation; but the judge, Baron Alderson, excused him the flogging. In 1869 an Irish lad, O’Connor, was sentenced to eighteen months’ imprisonment and a whipping for presenting a pistol at the queen, with a petition, in St James’s Park; but this time it was the Queen herself who privately remitted the corporal punishment, and she even pushed clemency to the length of sending her assassin to Australia at her own expense. The series of courts was closed when she sentenced a man named Maclean, who fired a pistol at her majesty as she was leaving the Great Western Railway station at Windsor. He, like Bean, was a genuine madman, and was relegated to Broadmoor.

The birth of the princess royal, on the 21st of November 1840, removing the unpopular King Ernest of Hanover from the position of heir-presumptive to the British crown, was a subject of loud congratulations to the people. A curious scene was occasioned at Buckingham Palace, when the little princess was a fortnight old, by the discovery of a boy named Jones concealed under a bed in the royal nursery. Jones had a mania for palace-breaking. Three times he effected a clandestine entry into Buckingham Palace, and twice he managed to spend several days there. By day he concealed himself in cupboards or under furniture, and by night he groped his way into the royal kitchen to eat whatever he could find. After his third capture, in March 1841, he coolly boasted that he had lain under a sofa, and listened to a private conversation between the queen and Prince Albert. This third time he was not punished, but sent to sea, and turned out very well. The incident strengthened Prince Albert’s hands in trying to carry out sundry domestic reforms which were being stoutly resisted by vested interests. The royal residences and grounds were to be under the control of four different officials—the lord chamberlain, the lord steward, the master of the horse, and the commissioners of woods and forests. Baron Stockmar, describing the confusion fostered by this state of things, said—

“The lord steward finds the fuel and lays the fire; the lord chamberlain lights it. The lord chamberlain provides the lamps; the lord steward must clean, trim, and light them. The windows belong to the lord chamberlain’s department, but the outer parts must be attended to by the office of woods and forests, so that windows remain dirty unless the two departments came to an understanding.

“Before Prince Albert four years of firmness and diplomacy before in 1845 he was able to bring the queen’s home under the efficient control of a master of the household.

“At the general election of 1841 the Whigs returned in a minority of seventy-six, and Lord Melbourne was defeated on the Address and resigned. The queen was affected to tears at parting with him; but the crisis had been so fully expected and prepared for by confidential communications between Mr Anson and Sir Robert Peel, who now became prime minister (see Letters of Queen Victoria, i. 341 et seq.) that difficulty as to the appointments to the royal household was tactfully removed, and Tory appointments were made, which were agreeable both to the queen and to Peel. The only temporary embarrassment was the queen’s continued private correspondence with Lord Melbourne, which led Stockmar to remonstrate with him; but Melbourne used his influence sensibly; moreover, he gradually dropped out of politics, and the queen got used to his not being indispensable.

“On Prince Albert’s position the change had a marked effect, for in the absence of Melbourne the queen showed more particularly on her side a disposition to recognize the prince’s unusual charm and capacity. One of the Tory premier’s first acts was to propose that a royal commission should be appointed to consider the best means for promoting art and science in the kingdom, and he nominated Prince Albert as president. The International Exhibition of 1851, the creation of the Museum and Science and Art Department at South Kensington, the founding of art schools and picture galleries all over the country, the spread of musical taste and the fostering of technical education may be attributed, more or less directly, to the commission of distinguished men which began its labours under Prince Albert’s auspices.

“The queen’s second child, the prince of Wales (see EDWARD VII), was born on the 6th of November 1841; and this event ‘filled the measure of the queen’s domestic happiness,’ as he said in her speech from the throne at the opening of the session of 1842. It is unnecessary from this point onwards to go seriatim through the domestic history of the reign, which is given in the article ENGLISH HISTORY. At this time there was much political unrest at home, and serious difficulties abroad. As regards internal politics, it may be remarked that the queen and Prince Albert were relieved when Peel, who had come in as the leader of the Protectionist party, adopted Free Trade and repealed the Corn Laws, for it closed a dangerous agitation which gave them much anxiety. When the country was in distress, the queen felt a womanly repugnance for festivities; and yet it was undesirable that the court should incur the reproach of living meanly to save money. There was a conversation between the queen and Sir Robert Peel on this subject in the early days of the Tory administration, and the queen talked of reducing her establishment in order that she might give away larger sums in charities. I am afraid the people would only say that your majesty was returning them change for their pounds in halfpence,” answered Peel. “Your majesty is not perhaps aware that the most unpopular person in the parish is the relieving officer, and if the queen were to constitute herself a relieving officer for all the parishes in the kingdom she would find her money go a very little further, and she would provoke more grumbling than thanks.”

“Peel added that a sovereign must do all things in order, not seeking praise for doing one particular thing well, but striving to be an example in all respects, even in dinner-giving.

“I mean while the year 1841 was ushered in by splendid fêtes in honour of the king of Prussia, who held the prince of Wales at the font. In the spring there was a fancy-dress ball at Buckingham Palace, which remained memorable owing to the offences
which it gave in France. Prince Albert was costumed as Edward III., the queen as Queen Philippa, and all the gentle-
men of the court as knights of Poitiers. The French chose to
view this as an unfriendly demonstration, and there was some
talk of getting up a counter-ball in Paris, the duke of Orleans
to figure as William the Conqueror. In June the queen took
her first railway journey, travelling from Windsor to Paddington
on the Great Western line. The master of the horse,
whose business it was to provide for the queen’s
ordinary journeys by road, was much put out by this
innovation. He marched into the station several
minutes before the engine was ready to start. It
posted the journey on the way to Paddington in
58 minutes, which was remarkable, as they had examined a steed; but greater merit was occasioned by
the queen’s coachman, who insisted that, as a matter of form,
he ought to make-believe to drive the engine. After some
dispute, he was told that he might climb on to the pilot engine
which was to precede the royal train; but his scarlet livery,
white gloves and wig suffered so much from soot and sparks
that he made no more fuss about his rights in after trips. The
motion of the train was found to be so pleasant that the queen
readily trusted herself to the railway for a longer journey a few
months later, when she paid a visit to London. A report by
Sir John Clark led to the queen’s visiting Balmoral in 1848, and
to the purchase of the Balmoral estate in 1852, and the queen’s diary of her journeys in Scotland shows
what constant enjoyment she derived from her Highland home.
Seven years before this the estate of Osborne had been
purchased in the Isle of Wight, in order that the queen might have
a home of her own. Windsor she considered too stately, and
the Pavilion at Brighton too uncomfortable. The first stone
of Osborne House was laid in 1845, and the royal family entered
into possession in September 1846.

A visit to 1843, the queen and Prince Albert paid a visit to
King Louis Philippe at the chateau d’Eu. They sailed from
Southampton for Tréport in a yacht, and, as it hap-
pened to be raining hard when they embarked, the
loyal members of the Southampton Corporation remem-
bered Raleigh, and spread their robes on the ground
for the queen to walk over. In 1844 Louis Philippe
returned the visit by coming to Windsor. It was the first
visit ever paid by a king of France to a sovereign of England,
and Louis Philippe was much pleased at receiving the Order
of the Garter later on when he paid that honour to the
Queen. A report by Sir John Clark led to the “Club” of European
sovereigns until he received this
collection. As the father of King Leopold of Belgium’s
consort, the queen was much interested in his visit, which
went off with great success and goodwill. The tsar Nicholas had
visited Windsor earlier that year, in which also Prince Alfred,
who was to marry the tsar’s grand-daughter, was born.

In 1846 the affair of the “Spanish marriages” seriously
troubled the relations between the United Kingdom and France. Louis Philippe and Guizot had planned the marriage
of the duke of Montpensier with the infants Louisa of Spain,
younger sister of Queen Isabella, who, it was thought at the
time, was not likely ever to have children. The intrigue was
therefore one for placing a son of the French king on the
Spanish throne. (See SPAIN, HISTORY.) As to Queen Victoria’s
intervention on this question and on others, these words,
written by W. E. Gladstone in 1875, may be quoted:

“Although the admirable arrangements of the Constitution have
now shielded the sovereign from personal responsibility, they have
left ample scope for the exercise of direct and personal influence in
the whole work of government. . . . The sovereign as compared
with her ministers has, because she is the sovereign, the advantage
of long experience, wide survey, elevated position and entire
connection from the bias of party. Further, personal and domestic
relations with the ruling families abroad give openings in delicate
cases for saying more, and saying it at once more gently and more
eloquently. It could be ventured into the formation of the
least rude contacts of government. We know with how much
truth, fulness and decision, and with how much tact and delicacy,
the queen, aided by Prince Albert, took a principal part on behalf
of the nation in the painful question of the Spanish marriages.”

The year 1848, which shook so many continental thrones,
The queen's family life was most happy. At Balmoral and Windsor the court lived in virtual privacy; and the queen and her consort saw much of their children. Countless entries in the queen's diaries testify to the anxious affection with which the progress of each little member of the household was watched. Two more children had been born to the royal pair, Prince Leopold (duke of Albany) on the 7th of April 1853, and on the 14th of April 1857 their last child, the princess Beatrice (Princess Henry of Battenberg), bringing the royal family up to nine—four sons and five daughters. Less than a year after Princess Beatrice's birth the princess royal was married to Prince Frederick William of Prussia, and towards the emperor, the next marriage after the princess royal's was that of the princess Alice to Prince Louis (afterwards grand duke) of Hesse-Darmstadt in 1862. In 1863 the prince of Wales married the princess Alexandra of Denmark. In 1866 the princess Helena became the wife of Prince Christian of Schleswig-Holstein. In 1871 the princess Louise was wedded to the marquis of Lorne, eldest son of the duke of Argyll. In 1874 Prince Alfred, duke of Edinburgh, married Princess Marie Alexandrovna, only daughter of the tsar Alexander II. The duke of Connaught married in 1879 the princess Louise of Prussia, daughter of the soldier and statesman, Prince Frederick Charles. In 1882 Prince Leopold, duke of Albany, wedded the princess Helen of Waldeck-Pyrmont. Finally came the marriage of Princess Beatrice in 1885 with Prince Henry of Battenberg.

On the occasion of the coming of age of the queen's sons and the marriages of their daughters parliament made provision. The prince of Wales, in addition to the revenues of the duchy of Cornwall, had £40,000 a year, the princess £10,000, and an addition of £36,000 a year for their children was granted by parliament in 1869. The princess royal received a dowry of £40,000, and £10,000 a year for life, the younger daughters £6,000 a year. The dukes of Edinburgh, Connaught and Albany were each voted an income of £15,000, and £10,000 on marrying.

The dispute with the United States concerning the "Trent" affair of 1861 will always be memorable for the part played in its settlement by the queen and the prince consort. In 1861 the accession of Abraham Lincoln to the presidency of the United States of America caused the Southern States of the Union to revolt, and the war began. During November the British West India steamer "Trent" was boarded by a vessel of the Federal Navy, the "San Jacinto," and Messrs Slidell and Mason, commissioners for the Confederate States, who were on their way to England, were seized. The British government were on the point of demanding reparation for this act in a peremptory manner which could hardly have meant anything but war, but Prince Albert insisted on revising Lord Russell's despatch in a way which gave the American government an opportunity to concede the surrender of the prisoners without humiliation. The memorandum from the queen on this point was the prince consort's last political draft.
At the time of the prince consort’s death the prince of Wales was in his twenty-first year. He had spent several terms at each of the two universities of Oxford and Cambridge, and he had already travelled much, having visited most of Europe, Egypt and the United States.

His marriage solemnized at Windsor on the 10th of March 1863. The queen witnessed the wedding from the private pew or box of St George’s Chapel, Windsor, but she wore the deep mourning which she was never wholly to put off to the end of her life, and she took no part in the festivities of the wedding.

In foreign imperial affairs, and in the adjustment of serious parliamentary difficulties, the queen’s dynastic influence abroad and her position as above party at home, together with the respect due to her character, good sense and experience, still remained a powerful element in the British polity, as was shown on more than one occasion. In 1866 the Austro-Prussian War broke out, and many short-sighted people were tempted to side with France when, in 1867, Napoleon III. sought to obtain a “moral compensation” by laying a claim to the duchy of Luxembourg. A conference met in London, and the difficulty was settled by neutralizing the duchy and ordering the evacuation of the Prussian garrison who kept garrison there. But this solution, which averted an imminent war, was only arrived at through Queen Victoria’s personal intercession. In the words of a French writer—

“The queen wrote both to the king of Prussia and to the emperor Napoleon. Her letter to the emperor, pervaded with those most mystic emotions, which she kept for the queen’s mind, particularly since the death of Prince Albert, seems to have made a deep impression on the sovereign who, amid the struggles of politics, had never completely repudiated the philanthropic theories of his youth, and who, on the battle-field of Solferino, covered with the dead and wounded, was seized with an unspeakable horror of war.”

Moreover, Disraeli’s two premierships (1868, 1874-80) did a good deal to give new encouragement to a right idea of the constitutional function of the crown. Disraeli thought that the queen ought to be a power in the state. His notion of duty—that once a loyal and chivalrous word—was that he was obliged to give the queen the best of his advice, but that the final decision in any course lay with her, and that once she had decided, he was bound, whatever might be his own opinion, to stand up for her decision in public. The queen, not unnaturally, came to trust Disraeli implicitly, and she frequently showed her friendship for him. At his death she paid an exceptional tribute to his “dear and honoured memory” from his “grateful and affectionate sovereign and friend.” To something like this position Lord Salisbury after 1886 succeeded. A somewhat different conception of the sovereign’s functions was that of Gladstone, the great rival, Gladstone, who, though his respect for the person and office of the sovereign was unbounded, not only expected all people, the queen included, to agree with him when he changed his mind, but to become suddenly enthusiastic about his new ideas. The queen consequently never felt safe with him. Nor did she like his manner—he spoke to her (she is believed to have said) as if she were a public meeting. The queen was opposed to the Disestablishment of the Irish Church (1863)—the question which brought Gladstone to be premier—and though she had good sense, Gladstone was faultless and astonished because she would not pretend to give a hearty assent to the measure. Through her secretary, General Grey, the queen pointed out that she had not concealed from Gladstone “how deeply she deplored” his having felt himself under the necessity of raising the question, and how apprehensive she was of the possible consequences of the measure; but, when a general election had pronounced on the principle, when the bill had been carried through the House of Commons by unvarying majorities, she did not see what good could be gained by rejecting it in the Lords. Later, when through the skilful diplomacy of the prime the Lords had passed the second reading by a small but sufficient majority (179 to 146), and after amendments had been adopted, the queen wrote—

“The queen... is very sensible of the prudence and, at the same time, the anxiety for the welfare of the Irish Establishment which the archbishop has manifested during the course of the debates, and she will with uprightness in the amendments which have been adopted at his suggestion lead to a settlement of the question; but to effect this, concessions, the queen believes, will have to be made on both sides. The queen must say that she cannot view with much alarm the possible modifications in connection with the Irish Church, and she would ask the archbishop seriously to consider, in case the concessions to which the government may agree should not go so far as he may himself wish, whether the possible inconvenience of 1867 for the Roman Catholics may not be likely to result in worse rather than in better terms for the Church. The queen trusts, therefore, that the archbishop will himself consider, and as far as he can, the probable consequences of a settlement of the question, and any concessions which may be offered by the House of Commons in the most conciliatory spirit.”

The correspondence of which this letter forms a part is one of the few published witnesses to the queen’s careful and active interest in home politics during the latter half of her reign; but it is enough to prove how wise, how moderate and how steeped in the spirit of the Constitution she was. Another instance is that of the County Franchise and Redistribution Bills of 1884-5. There, again, a conflict between the two houses was imminent, and the queen’s wish for a settlement had considerable weight in bringing about the curious but effective conference of the two parties, of which the first suggestion, it is believed, was due to Lord Randolph Churchill.

In 1876 a bill was introduced into parliament for conferring on the queen the title of “Empress of India.” It met with much opposition, and it was put forward with all the force of ministering “Empress simply to a whim of the sovereign, whereby to import the title was intended to impress the idea of British suzerainty forcibly upon the minds of the native princes, and upon the population of Hindustan. The prince of Wales’s voyage to India in the winter of 1875-76 had brought the heir to the throne into personal relationship with the great Indian vassals of the British crown, and it was felt that a further demonstration of the queen’s interest in her magnificent dependency would confirm their loyalty.

The queen’s private life during the decade 1870-80 was one of quiet, broken only by one great sorrow when the Princess Alice died in 1878. In 1886 her majesty had started in authorship by publishing The Early Days of the Prince Consort, compiled by General Grey; in 1889 she gave to the world her interesting and simply written diary entitled Leaves from the Journal of our Life in the Highlands, and in 1874 appeared the first volume of The Life and Letters of the Prince Consort (2nd vol. in 1880), edited by Sir Theodore Martin. A second instalment of the Highland journal appeared in 1885. These literary occupations solaced the hours of a life which was mostly spent in private, and in the interval, that part of the queen’s reign over which her majesty had control, in which she was always accompanied by her youngest daughter, the Princess Beatrice, brought a little variety into the home-life, and aided much in keeping up the good health which the queen enjoyed almost uninteruptedly. So far as public ceremonies were concerned, the prince and princess of Wales were now coming forward more and more to represent the royal family. People noticed meanwhile that the queen had taken a great affection for her Scottish man-servant, John Brown, who had been in her service since 1849; she made him her constant personal attendant, and looked on him more as a friend than as servant. When he died in 1883 the queen’s grief was intense.

From 1880 onwards Ireland almost monopolized the field of domestic politics. The queen was privately opposed to Gladstone’s Home Rule policy; but she observed in public a constitutional reticence on the subject. In the year, however, of the Crimes Act 1887, an event took place which was of more intimate personal concern to the queen, and of more attractive import to the country and the empire at large. June 18, was the fiftieth anniversary of her accession to the throne, and on the following day, for the second time in English history, a great Jubilee celebration was held to commemorate so happy an event. The country threw
itself into the celebration with uncheckd enthusiasm; large
sums of money were everywhere subscribed; in every city,
town and village something was done both in the way of
rejoicing and in the way of establishing some permanent
memorial of the event. In London the day itself was kept by
a solemn service in Westminster Abbey, to which the queen
was in state, surrounded by the most brilliant, royal, and
princely escort that had ever accompanied a British sovereign,
and cheered on her way by the applause of hundreds of thousands
of her subjects. The queen had already paid a memorable visit
to the East End, when she opened the People’s Palace on the
14th of May. On the 2nd of June she reviewed at Buckingham
Park, and the next day she opened the new buildings of a
royal ladies’ college. On the 4th of July she laid the foundation stone of
the Imperial Institute, the building at Kensington to which, at the instance
of the prince of Wales, it had been determined to devote the
large sum of money collected as a Jubilee offering, and which
was opened by the queen in 1893. On the 9th of July the
queen reviewed 60,000 men at Aldershot; and, last and chief
of all, on the 23rd of July, one of the most brilliant days of
a brilliant summer, she reviewed the fleet at Spithead.

The year 1888 witnessed two events which greatly affected
European politics, and the beginning of an epoch opposed to
the life of the English court. On the 9th of March
the emperor William I. died at Berlin. He was
succeeded by his son, the emperor Frederick III.,
regarded with special affection in England as the husband
of the princess royal. But at the same time he was suffering
from a malignant disease of the throat, and he died on the
15th of June, being succeeded by his eldest son, the emperor
William II., the grandson of the queen. Meanwhile Queen
Victoria spent some weeks at Florence at the Villa Palmieri,
and returned home by Darmstadt and Berlin. In spite of the
illness of the emperor Frederick a certain number of court
festivities were held in her honour, and she had long
conversations with Prince Bismarck, who was deeply impressed
by her majesty’s personality. Just before, the prince, who
was still chancellor, had taken a very strong line with regard to
a royal marriage in which the queen was keenly interested—
the proposal that Prince Alexander of Battenberg, lately ruler
of Bulgaria, and brother of the queen’s son-in-law, Prince Henry,
should marry Princess Victoria, the eldest daughter of the
emperor Frederick, Prince Bismarck, who had been anti-
Battenberg since the beginning, vehemently opposed the
marriage, on the ground that for reasons of state policy it would
never do for a daughter of the German emperor to marry
a prince who was personally disliked by the tsar. This affair
caused no little agitation in royal circles, but in the end state
reasons were allowed to prevail and the chancellor had his
way.

The queen had borne so well the fatigue of the Jubilee that
during the succeeding years she was encouraged to make some-
what more frequent appearances among her subjects.

In May 1888 she attended a performance of Sir Arthur
Sullivan’s Golden Legend at the Albert Hall, and in August she
visited Glasgow to open the magnificent new municipal buildings,
remaining for a couple of nights at Blythswood, the seat of
Archibald Campbell. Early in 1889 she received at Windsor
a special embassy, which was the beginning of a memorable
chapter of English history: two Matahele chiefs were sent by
King Lobengula to present his respects to the “great White
Queen,” as to whose very existence, it was said, he had up
till that time been sceptical. Soon afterwards her majesty
went to France, and returned by way of the Ionian Islands
on which she paid to the queen-regent of Spain at San Sebasti-
án, the only visit that an English reigning sovereign had ever
drawn to the Peninsula.

The relations between the court and the country formed
matter in 1889 for a somewhat sharp discussion in parliament
and in the press. A royal message was brought by Mr W. H.
Smith on the 2nd of July, expressing, on the one hand, the
queen’s desire to provide for Prince Albert Victor of Wales, and,
on the other, informing the house of the intended marriage
of the prince of Wales’s daughter, the Princess Louise, to the
earl (afterwards duke) of Fife. ‘On the proposal of
Mr Smith, seconded by Gladstone, a select committee
Parlia-
mentary was appointed to consider these messages and to
report to the house as to the existing practice and as to
the principles to be adopted for the future. The evidence
laid before the committee explained to the country for the first time the actual state of the royal income,
and on the proposal of Gladstone, amending the proposal of
the government, it was proposed to grant a fixed addition of
£25,000 a year to the present income of the sovereign, which
he should be expected to provide for his children without further
application to the country. Effect was given to this proposal
in a bill called “The Prince of Wales’s Children’s Bill,” which
was carried in spite of the persistent opposition of a small group of
Radicals.

In the spring of 1890 the queen visited Aix-les-Bains in
the hope that the waters of that health resort might alleviate
the rheumatism from which she was now frequently
suffering. She returned as usual by way of Darmstadt,
and shortly after her arrival at Windsor paid a visit to Baron
W. Rothschild at Waddesdon Manor. In February
she launched the battleship “Royal Sovereign” at Portsmouth;
and a week later she visited the Horse Show at Islington. Her
annual spring visit to the South was this year paid to the little
town of Grasse.

At the beginning of 1892 a heavy blow fell upon the queen
in the death of the prince of Wales’s eldest son Albert Victor,
duke of Clarence and Avondale. He had never been
of a robust constitution, and after a little more than
a week’s illness from pneumonia following influenza,
he died at Sandringham. The pathos of his death was
increased by the fact that only a short time before it had
been announced that the prince was about to marry his second
cousin, Princess May, daughter of the duke and duchess
of Teck.

The death of the young prince threw a gloom over the
country, and caused the royal family to spend the year in
such retirement as was possible. The queen this year paid
a visit to Costebelle, and stayed there for some quiet weeks.
In 1893 the country, on the expiration of the royal mourning,
began to take a more than usual interest in the affairs of
the royal family. On the 19th of February the queen took
leave home for a visit to Florence, and spent it
in the Villa Palmieri. She was able to display remarkable
energy in visiting the sights of the city, and even went as
far afield as San Gimignano; and her visit had a notable
effect in strengthening the bonds of friendship between
the United Kingdom and the Italian people. On 28th April
she arrived home, and a few days later the prince of Wales’s
second son, George, duke of York (see George V.), who by his
brother’s death had been left in the direct line of succession to
the throne, was betrothed to the Princess May, the marriage
being celebrated on 6th July in the Chapel Royal of St James’s
Palace.

In 1894 the queen stayed for some weeks at Florence, and
on her return she stopped at Coburg to witness the marriage
between two of her grandchildren, the grand duke
of Hesse and the Princess Victoria Melita of Coburg.

On the next day the emperor William officially announced
the betrothal of the Cesarovitch (afterwards the tsar Nicholas II.)
to the princess Alix of Hesse, a grandaughter whom the
queen had always regarded with special affection. After
a few weeks in London the queen went northwards and stopped
at Manchester, where she opened the Ship Canal. Two days
afterwards she celebrated her seventy-fifth birthday in quiet
at Balmoral. A month later (June 23) took place the birth
of a son to the duke and duchess of York, the child receiving
the thoroughly English name of Edward.

In 1895 the queen lost her faithful and most efficient private
secretary, General Sir Henry Ponsonby, who for many years
had helped her in the management of her most private affairs and had acted as an intermediary between her and her ministers with singular ability and success. His successor was Sir Arthur Bigge. The following year, 1896, was marked by a tragic event which touched the queen even more nearly and more personally. At his own urgent request Prince Henry of Battenberg, the queen's son-in-law, was permitted to join the Ashanti expedition, and early in January the prince was struck down with fever. He was brought to the coast and put on board her majesty's ship "Blonde," where, on the 20th, he died.

In September 1896 the queen's reign had reached a point at which it exceeded in length that of any other English sovereign; but by her special request all public celebrations of the fact were deferred until the following June, which marked the completion of sixty years from her accession. As the time drew on it was obvious that the celebrations of this Diamond Jubilee, as it was popularly called, would exceed in magnificence those of the Jubilee of 1857. Mr Chamberlain, the secretary for the colonies, induced his colleagues to seize the opportunity of making the jubilee a festival of the British empire. Accordingly, the prime ministers of all the self-governing colonies, with their families, were invited to come to London as the guests of the country to take part in the Jubilee procession and drafts of the troops from every British colony and dependency were brought home for the same purpose. The procession was, in the strictest sense of the term, unique. Here was a display, not only of Englishmen, Scotsmen, Irishmen, Welshmen, but of Mounted Rifles from Victoria and New South Wales, from the Cape and from Natal, and from the Dominion of Canada. Here were Hausas from the Niger and the Gold Coast, coloured men from the West India regiments, sappers from Cyprus, Chinsmen from Hong Kong, and Dyaks—now civilized—told their own tale. The presence of a large contingent of Sikhs also added to its splendour. Here, most brilliant sight of all, were the Imperial Service troops sent by the native princes of India; while the detachments of Sikhs who marched earlier in the procession received their full meed of admiration and applause. Altogether the queen was in her carriage for more than four hours, in itself an extraordinary physical feat for a woman of seventy-eight. Her own feelings were shown by the simple but significant message she sent to her people throughout the world: "From my heart I thank my beloved people. May God bless them!" The illuminations in London and the great provincial towns were magnificent, and all the hills from Ben Nevis to the South Downs were crowned with bonfires. The queen herself held a great review at Aldershot; but a much more significant display was the review by the prince of Wales of the fleet at Spithead on Saturday, the 26th of June. No less than 165 vessels of all classes were drawn up in four lines, extending altogether to a length of 30 m.

The two years that followed the Diamond Jubilee were, as regards the queen, comparatively uneventful. Her health remained good, and her visit to Cimiez in the spring of 1898 was as enjoyable and as beneficial as before. In May 1890, after another visit to the Riviera, the queen performed what proved to be her last ceremonial function in London; she proceeded in "semi-state" to South Kensington, and laid the foundation stone of the new buildings completing the Museum—henceforth to be called the Victoria and Albert Museum—which had been planned more than forty years before by the prince consort.

Griefs and anxieties encompassed the queen during the last year of her life. But if the South African War proved more serious than had been anticipated, it did more to weld the empire together than years of peaceful progress might have accomplished. The queen's frequent messages of thanks and greeting to her colonies and to the troops sent by them, and her reception of the latter at Windsor, gave evidence of the heartfelt joy with which she saw the sons of the empire giving their lives for the defence of its integrity; and the satisfaction which she showed in the Federation of the Australian colonies was no less keen. The reverses of the first part of the Boer campaign, together with the loss of her eldest daughter, was no small part of that "great strain" of which the Court Circular spoke in the ominous words which first told the country that she was seriously ill. But the queen faced the new situation with her usual courage, devotion and strength of will. She reviewed the departing regiments; she entertained the wives and children of the Windsor soldiers who had gone to the war; she showed by frequent messages her watchful interest in the course of the campaign and in the efforts which were being made throughout the whole empire; and the Christmas gift of a box of chocolate to every soldier in South Africa was a touching proof of her sympathy and interest. She relinquished her annual holiday on the Riviera, feeling that at such a time she ought not to leave her country. Entirely on her own initiative, and moved by admiration for the fine achievements of "her brave Irish" during the war, the queen announced her intention of paying a long visit to Dublin; and there, accordingly, she went for the month of April 1900, staying in the Viceregal Lodge, receiving many of the leaders of Irish society, inspecting some 50,000 school children from all parts of Ireland, and taking many a drive amid the charming scenery of the neighbourhood of Dublin. She went even further than this attempt to conciliate Irish feeling, and to show her recognition of the gallantry of the Irish soldiers she issued an order for them to wear the shamrock on St Patrick's Day, and for a new regiment of Irish Guards to be constituted.

In the previous November the queen had had the pleasure of receiving, on a private visit, her grandson, the German Emperor, who came accompanied by the empress and by two of their sons. This visit cheered the queen, and the successes of the army which followed the arrival of Lord Roberts in Africa and the capture of Pretoria induced the queen to order the Navy to send a special fleet to the Indian Ocean to celebrate the jubilee that had been postponed. When the fleet arrived it was received with much enthusiasm, and a great deal of interest. But independently of the public anxieties of the war, and of those aroused by the violent and unexpected outbreak of fanaticism in China, the year brought deep private griefs to the queen. In 1899 her grandson, the hereditary prince of Coburg, had succumbed to phthisis, and in 1900 his father, the duke of Coburg, the queen's second son, previously known as the duke of Edinburgh, also died (July 30). Then Prince Christian Victor, the queen's grandson, fell a victim to enteric fever at Pretoria; and during the autumn it came to be known that the empress of India was suffering from tuberculosis, a disease that had previously been publicized and of which she had been warned. More recently that very health was very seriously ill. Moreover, just at the end of the year which greatly shocked and grieved the queen was experienced in the sudden death, at Windsor Castle, of the Dowager Lady Churchill, one of her oldest and most intimate friends. These losses told upon the queen at her advanced age. Throughout her life she had enjoyed excellent health, and even in the last few years the only marks of age were rheumatic stiffness of the joints, which prevented walking, and a diminished power of sight. In the autumn of 1900, however, her health began definitely to fail, and though arrangements were made for another holiday in the South, it was plain that her strength was seriously affected. Still she continued the ordinary routine of her duties and occupations. Before Christmas she made her usual journey to Osborne, and there on the 2nd of January she received Lord Roberts on his return from South Africa and handed to him the insignia of the Garter. A fortnight later she commanded a second visit from the field-marshall; she continued to transact business, and until a week before her death she still took her daily drive. A sudden loss of power then supervened, and on Friday evening, the 18th of January, the Court Circular published an authoritative announcement of her illness. On Tuesday, the 22nd of January 1901, she died.

Queen Victoria was a ruler of a new type. When she ascended the throne the popular faith in kings and queens was on the decline. She revived that faith; she consolidated her throne; she not only captivated the affections of the multitude, but
VICTORIA, T. L. DA—VICTORIA (AUSTRALIA)

won the respect of thoughtful men; and all this she achieved by methods which to her predecessors would have seemed impracticable—methods which it required no less shrewdness to discover than force of character and honesty of heart to adopt steadfastly. Whilst all who approached the queen bore witness to her candour and reasonableness in relation to her ministers, all likewise proclaimed how anxiously she considered advice that was submitted to her before letting herself be persuaded that she must accept it for the good of her people.

By her long reign and unblemished record her name had become associated inseparably with British institutions and imperial solidarity. Her own life was by choice, and as far as her position would admit, one of almost austere simplicity and homeliness; and her subjects were proud of a royalty which involved none of the mischiefs of caprice or ostentation, but set an example alike of motherly sympathy and of queenly dignity. She became more and more that day by her own country, not even by all English-speaking people, but by the whole world. The funeral in London on the 2nd and 26th of February, including first the passage of the coffin from the Isle of Wight to Gosport between lines of warships, and secondly a military procession from London to Windsor, was a memorable solemnity: the greatest of English sovereigns, whose name would in history mark an age, had gone to her rest.

There is a good bibliographical note at the end of Mr Sidney Lee’s article in the National Dictionary of Biographies. See also the Letters of Queen Victoria (1907), and the obituary published by The Times, from which some passages have been borrowed above. (H. C. L.)

VICTORIA (or VITTORIA), TOMMASO LUDOVICO DA
(c. 1540-c. 1615), Spanish musical composer, was born at Avila (unless, as Haberl conjectures, his title of Presbyter Abulensis refers not to his birthplace but to his parish as priest, so that his name would indicate that he was born at Vittoria). In 1573 he was appointed as Maestro di Cappella to the Collegium Germanicum at Rome, where he had probably been trained. Victoria left Rome in 1585, being then appointed vice-master of the Royal Chapel at Madrid, a post which he held until 1602. In 1603 he composed the funeral of the empress Maria the greatest requiem of the Golden Age, which is his last known work, though in 1613 a contemporary speaks of him as still living. He was not ostensibly Palestrina’s pupil; but Palestrina had the main influence upon his art, and the personal relations between the two were as intimate as were the artistic. The work begun by Morales and perfected by Palestrina left no stumbling-blocks in Victoria’s path and he was able from the outset to express the purity of his ideals of religious music without having to sift the good from the bad in that Flemish tradition which had centered at Palestrina, in whilst it enlarged his fame. From Victoria’s first publication in 1572 to his last requiem (the Officium Defunctorum of 1604) there is practically no change of style, all being pure church music of unsurpassing loftiness and showing no inequality except in concentration of thought. Like his countryman and predecessor Morales, he wrote no secular music; yet he differs from Morales, perhaps more than can be accounted for by his later date, in that his devotional spirit is impulsive rather than ascetic. His work is the crown of Spanish music: music which has been regarded as not constituting a special school, since it absorbed itself so thoroughly in the Rome of Palestrina. Yet, as has been aptly pointed out in the admirable article “Vittoria” in Grove’s Dictionary of Music and Musicians, Roman music owes so much to that Spanish school which produced Guerrero, Morales and Victoria, that it might fairly be called the Hispano-Roman school. In spite of the comparative smallness of Victoria’s output as compared with that of many of his contemporaries, there is no mistaking his claim to rank with Palestrina and Orlando di Lasso in the triad of supreme 16th-century masters. In any extensive anthology of liturgical polyphony such as the Musica Divina of Proske, his work stands out as impressively as Palestrina’s and Lasso’s; and the style, in spite of a resemblance to Palestrina which amounts to imitation, is as individual as any one a successful imitator of Palestrina can be. That is to say, Victoria’s individuality is strong enough to assert itself by the very act of following Palestrina’s path. When he is below his best his style does not become cradled or harsh, but over-fine and too high never falling in euphony. If he seldom displays an elaborate technique it is not because he conceals it, or lacks it. His mastery is unifying, but his methods are those of direct emotional effect; and the intellectual qualities that strengthen and deepen this emotion are themselves innate and not sought out. The emotion is reasonable and lofty, not because he has trained himself to think correctly, but because he does not know that any one can think otherwise. His works fill eight volumes in the complete edition of Messrs Breitkopf and Härtel.

VICTORIA, a British colonial state, occupying the southeastern coast of Australia. Its western boundary is in 140° 58’ E.; on the east it runs out to a point at Cape Howe, in 150° E. long., being thus rude triangular in shape; the river Murray constitutes nearly the whole of the northern boundary, its most northerly point being in 34° S. lat.; the southern boundary is the coast-line of the Southern Ocean and of Bass Strait; the most southerly point is Wilson’s Promontory in 30° S. lat. The greatest length east and west is about 450 m.; the greatest width, in the west, is about 250 m. The area is officially stated to be 8,854 sq. m.

The coast must be estimated at about 800 m. It begins about the 141st meridian with bold but not lofty sandstone cliffs, worn into deep caves and caved by grassy undulations, which extend inland to pleasant park-like lands. Capes Bridgewater and Nelson form a peninsula of forest lands, broken by patches of meadow. To the east of Cape Nelson lies the moderately sheltered inlet of Portland Bay, consisting of a sweep of sandy beach flanked by bold granite rocks. Then comes a long unbroken stretch of high cliffs, which, owing to inserting currents, have been the scene of many calamitous wrecks. Cape Otway is the termination of a wild mountain range that here abuts on the coast. Its brown cliffs rise vertically from the water; and the steep slopes above are covered with dense forests of exceedingly tall timber and tree-ferns. Eastwards from this cape the line of cliffs gradually diminishes in height to about 20 to 40 ft. at the entrance to Port Phillip. Next comes Port Phillip Bay, at the head of which stands the city of Melbourne. When the tide recedes from this bay through the narrow entrance it often encounters a strong current just outside; the broken and somewhat dangerous sea thus caused is called “the Rip.” East of Port Phillip Bay the coast consists for 15 m. of a line of sandbanks; but at Cape Schanck they suddenly become high and bold. East of this comes Western Port, a deep inlet more than half occupied by French Island and Phillip Island. Its shores are flat and uninteresting, in some parts swampy. The bay is shallow and of little use for navigation. The coast continues rocky round Cape Liptrap. Wilson’s Promontory is a great rounded mass of granite hills, with wild and striking scenery, tree-fern gullies and gigantic gum-trees, connected with the mainland by a narrow sandy isthmus. At its extremity lie a multitude of rocky islets, with steep granite edges. North of this cape, and
opening to the east, lies Corner Inlet, which is dry at low water. The coast now continues low to the extremity of the colony. The slight bend northward forms a sort of bight called the Ninety Mile Beach, but it really exceeds that length. It is an unbroken line of sandy shore, backed by low sandhills, on which grows a sparse dwarf vegetation. Behind these hills comes a succession of lakes, surrounded by excellent land, and beyond these rise the soft blue outlines of the mountain masses of the interior. The shores on the extreme east are somewhat higher, and occasionally rise in bold points. They terminate in Cape Howe, off which lies Gabo Island, of small extent but containing an important lighthouse and signalling station.

The western half of Victoria is level or slightly undulating, and as a rule tame in its scenery, exhibiting only thinly timbered grassy lands, with all the appearance of open parks. The north-west corner of the colony, equally flat, is dry and sometimes sandy, and frequently bare of vegetation, though in one part some seven or eight millions of acres are covered with the dense brushwood known as "mallee scrub." This wide western plain is slightly broken in two places. In the south the wild ranges of Cape Otway are covered over a considerable area with richly luxurious but almost impassable forests. This district has been reserved as a state forest and its coast forms a favourite holiday resort, the scenery being very attractive. The middle of the plain is crossed by a thin line of mountains, known as the Australian Pyrenees, at the western extremity of which there are several irregularly placed transverse ranges, the chief being the Grampians, the Victoria Range and the Sierra Range. Their highest point is Mount William (4600 feet). The eastern half of the colony is wholly different. Though there is plenty of level land, it occurs in small patches, and chiefly in the south, in Gippsland, which extends from Corner Inlet to Cape Howe. But a great part of this eastern half is occupied with the complicated mass of ranges known collectively as the Australian Alps. The whole forms a plateau averaging from 1000 to 2000 ft. high, with many smaller tablelands ranging from 3000 to 5000 ft. in height. The highest peak, Bogong, is 6690 ft. in altitude. The ranges are so densely covered with vegetation that it is extremely difficult to penetrate them. About fifteen peaks over 5000 ft. in height have been measured. Along the ranges grow the giant trees for which Victoria is famous. The narrow valleys and gullies contain exquisite scenery, the rocky streams being overshadowed by groves of graceful tree-ferns, from amid whose waving fronds rise the tall smooth stems of the white gums. Over ten millions of acres are thus covered with forest-clad mountains which in due time will become a very valuable asset of the state. The Australian Alps are connected with the Pyrenees by a long ridge called the Dividing Range (1500 to 3000 ft. high).

Victoria is fairly well watered, but its streams are generally too small to admit of navigation. This, however, is not the case with the Murray river (q.v.). The Murray for a distance of 670 m. (or 1250 m. if its various windings are followed) forms the boundary between New South Wales and Victoria; it receives a number of tributaries from the Victorian side. The Mitta Mitta, which rises in the heart of the Australian Alps, is 150 m. long. The Ovens, rising among the same mountains, is slightly shorter. The Goulburn (330 m.) flows almost entirely through a richly agricultural country, and is deep enough to be used in its lower part for navigation. The valley of this river is a fertile grain-producing district. The Campaspe (150 m.) has too little volume of water to be of use for navigation; its valley is also agricultural, and along its banks there lie a close succession of thriving townships. The Loddon (over 200 m.) rises in the Pyrenees. The upper part flows through a plain to the right agricultural and to the left auriferous, containing nearly forty thriving towns, including Bendigo (formerly named Sandhurst) and Castlemaine. In the lower part of the valley the soil is also fertile, but the rainfall is small. To the west of the Loddon is the Avoca river with a length of 140 m.; it is of slight volume, and though it flows towards the Murray it loses itself in marshes and salt lagoons before reaching that river.

The rivers which flow southwards into the ocean are numerous. The Snowy river rises in New South Wales, and in Victoria flows entirely through wild and almost wholly unoccupied territory.
The Tambo (120 m. long), which rises in the heart of the Australian Alps, crosses the Gippsland plains and falls into Lake King, one of the Gippsland lakes; into the same lake falls the Mitchell river, rising in the same district. The Tambo is a tributary of the Tamar, a short distance. The Latrobe empties itself into Lake Wellington after a course of 135 m.; it rises at Mount Baw Baw. The Yarra Yarra rises in the Grampians and falls into the Yarra river which runs in a deep valley from the ranges, it follows a sinuous course through the undulating plains called the " Yarra Flats," which are wholly enclosed by hills, on whose slopes are some of the best vineyards of Australia. Northwest of Melbourne, between Baillieston and Lyttelton, Hopkins and Glenelg (280 m.) both water the splendid pastoral lands of the west, the lower course of the former passing through the fertile district of Warrnambool, well known throughout Australia as a potato-growing region.

In the west there are Lakes Corangamite and Colac, due north of Cape Otway. The former is intensely salt; the latter is fresh, having an outlet for its waters. Lakes Tyrell and Hindmarsh lies in the plains of the north-west. In summer they are dried up, and in winter are again formed by the waters of rivers that have no outlet. In the east are the Gippsland lakes, formed by the waters of the Dartmouth and Tamar, which are bounded by the sandhills of the Ninety Mile Beach. They are connected with Bass Strait by a narrow and shifting channel through a shallow bar; the government of Victoria has done a great deal of late years to deepen it. Lake Epping forms the head of the Avon Valley; Lake Wellington; a narrow passage leads into Lake Victoria, which is joined to a wider expanse called Lake King. These are all fresh-water lakes and are visited by tourists, being readily reached from Melbourne.

**Geology.**—Victoria includes a more varied and complete geological sequence than any other area of equal size in Australia. Its geological foundation consists of a band of Archean and Lower Paleozoic rocks which forms the backbone of the state. A belt of sedimentary rocks in this foundation have been thrown into folds, of which the axes trend approximately north and south. The London Clay, of the Carboniferous system, is the bed of the London District, Victoria, which occupy the whole width of the state at its eastern end, extending from the New South Wales border on the north to the shore of the Southern Ocean on the south. These Highlands constitute the whole of the mountainous country of Gippsland and the north-eastern districts. They become narrower to the west, and finally, beyond the old plateau of Dundas, disappear beneath the recent loams of the plains along the South Australian border. These strata include an upper series of Upper Cretaceous rocks, surface some Upper Paleozoic rocks, which occur in belts running north and south, and have been preserved by infolding or faulting; such rocks are extensive along the west coast of Victoria and in the Mountain Sandstones to the north-east of Melbourne; the belt of Devonian and Lower Carboniferous rocks that extends across eastern Victoria, through Mount Wellington to Mansfield; and finally the Rocking Hills, in the belt of Devonian rocks, near Cowes, are the remnants of a chain of Lower Devonian volcanoes. Further Upper Paleozoic rocks and the Upper Carboniferous glacial beds occur in basins on both northern and southern flanks of the Highlands. The Mesozoic rocks are confined to southern Victoria; they build up the hills of southern Gippsland and the Otway Ranges; and farther west, hidden by later rocks, they occur under the coast of the western district. Between the southern mountain belt and the Victorian Highlands occurs the Great Valley of Victoria, occupied by sedimentary and volcanic rocks of Kainozoic age. The North-Western Plains, occurring between the northern foot of the Highlands and the coast, is almost entirely covered by the belt of Tertiary rocks, erupted by a chain of Lower Devonian volcanoes. Further Upper Paleozoic rocks and the Upper Carboniferous glacial beds occur in basins on both northern and southern flanks of the Highlands.

Victoria has a fairly complete geological sequence, though it is poorer than New South Wales in the Upper Carboniferous and Lower Mesozoic. The Archean rocks form two blocks of gneisses and schists, both separated by their intrusive rocks, which are found in the middle of the northern part of Victoria. They were originally described as metamorphosed Silurian rocks, but must be of Archean age. The other rocks of the northern part of Victoria, which is mainly the Black Sun of the Australian Alps. Emerging, and forms the old framework upon which the geology of Victoria has been built up. They are known as the Heathcotean series, and consist of phyllites, schists and amphibolites; while their most characteristic feature is the contorted structure of the rocks and beds of jasperoids. Volcanic agglomerates occur in the series at the typical locality of Heathcote. The Heathcotean rocks form the Colibanbean Range, which runs for 40 m. northward and southward along the Coliban River from Mount Stirling. On the east, between the Cuthbert Range and the Victorian Alps, they apparently underlie parts of the Gippsland plains. The Cambrian rocks have so far only been definitely proved near Mansfield. Mr A. M. Howitt has there collected some fragmentary remains of Olenellus and worm tubes of the Cambrian genus Solenella. These beds at Mansfield contain phosphates, and there are deposits of lead and zinc.

The Ordovician system is well developed. It consists of slates and quartzites; and some schists around the granites of the western district. The beds of the former period in Victoria are accompanied by a rich graptolitic fauna, and they have been classified into the following divisions:

- **Upper Ordovician**
  - Darwilli Series
  - Castlemaine Series
  - Lancefield Series

The Ordovician beds are best developed in a band running north-northwest and south-south-east across Victoria, of which the eastern boundary passes through Melbourne. This Ordovician band begins on the south with the block forming the plateau of Ararat and Stony Creek. The northern extension of this belt is the Bassin formation. This outcrop is bounded to the north by the depression of Port Phillip and the basalt plains west of Melbourne. It reappears north of Lancefield, whence it extends along the Highlands, past Ballarat, with southern outcrops as far as St Kilda. It forms the whole of the Ballarat Plateau, and is continued northward through the goldfields of Castlemaine, Bendigo and the Pyreneeus, till it passes under the Northern Ranges. The Silurian rocks include the greater part of the strata of the Pyreneeus, and the age of the rocks in the Pyreneeus has not yet been collected, and they may be pre-Ordovician. Some Upper Ordovician rocks occur in the mountains of eastern Gippsland, as near Woods Point, and in northeastern Victoria and the Grampians.

The Silurian system consists of two divisions: the lower or Melbournian, and the upper or Yeringian. Both consist in the main of sandstones, quartzites and chert. The upper series includes nodules of limestones at Lithdayle, near Colac; and the upper sandstones, near the Thomson river. The limestones are rich in typical Silurian corals and bryozoans, and the shales and sandstones contain brachiopods and bryozoans. These rocks are rich in fossils, and are the most important of Victoria. They are the remnants of an old chain of volcanoes which once extended north and south across Victoria. The Middle Devonian is mainly formed of marine sandstones, and limestones in eastern Gippsland. It is best developed in the valleys of the Mitchell, the Tambo and the Snowy rivers. The Upper Devonian rocks are of Carboniferous age, and they include the beds of the former period, and the beds of the Upper Carboniferous, containing the gravel deposits and boulder clays, by which the occurrence of a Carboniferous glaciation in the Southern Hemisphere was first demonstrated. These beds occur at Heathcote, Bendigo, the Loddon Valley, southern Gippsland and the Northern-Eastern district. The beds are of a type containing ice-scrached boulders, which are sometimes rest upon ice-scrached, montomé surfaces, and some lake deposits, similar to those laid down in glacial lakes. The glacial beds are overlain by sandstones containing Gangamopteris, and a great many species of fossils are contained in this series, which are on the horizon of the Greta or Lower Coal Measures of New South Wales.

The Mesozoic group is represented only by Jurassic rocks, which form the mountains of southern Gippsland and include its coalfields. The rocks contain fossil land plants, occasional fish remains and the claw of a dimosaurus, &c. The coal is of excellent quality. The mudstones, which form the main bulk of this series, are largely composed of volcanic debris, which decomposes to a fertile soil. These rocks trend south-westward along the Bass Range, which reaches Western Port. They skirt the Mornington Peninsula, underlie part of Port Phillip and the Bass, and are exposed in the Barabool Hills to the south-west of Geelong; thence they extend into the Otway Ranges, which are wholly built of these rocks and contain some coal seams. Farther west they disappear into the Barwon or Barwon South district. They are exposed again in the Portland Peninsula, and rise again to form the Wannon Hills, to the south of Dundas. The Lower Coal Measures include three main series: Lower marine and volcanic. The main lacustrine series is probably of Oligocene
age, and is important from its thick beds of brown coal, which are
thickest in the Great Valley of Victoria in southern Gippsland.
A cliff face on the banks of the Latrobe, near Morwell, shows 90 ft.
of it, and a bore near Morwell is recorded as having passed through
88 ft. of it. It is extensive in the Gippsland area, and its influence is
very great. The brown coals occur to the south-east of Melbourne,
under the basaltts between it and Geelong. Brown coal is also
abundant on the plains south of Lakes Entrance, and on the river
westward to Alberton. At the time of the deposition of these
beds Wilson's Promontory probably extended south-eastward and
joined Tasmania; for the mid-Kainozoic marine deposits do not
occur on either coast. The beds are 9 ft. thick where they are found.
They extend up the old valley of Port Phillip as far as Keilor to the
north of Melbourne, and are widely distributed under the volcanic
rocks of the Yarra Plains. They are exposed on the floors of the
volcanic cinder cones, and have been found by mining operations
under the volcanic rocks of the Ballarat plateau near Ballarat.
The Miocene sea extended up the Glenelg valley, round the western
borders of the Dandenong Ranges, and spread over the Lower Murray
Basin into New South Wales; its southern-eastern limit was
in a valley at Stawell. Some later marine deposits occur at the
Lakes Entrance in eastern Gippsland, and in the valley of the
Glenelg.

The volcanic series begins with a line of great dacite domes
including the geburite-dactite of Macedon, which is associated with
southern mountains. Katoomba Kilmartins are associated with the
Katoomba lavas, which are described in the following pages. The
volcanic series was folowed by that of sheets of basalt of several different
ages, and the intrusion of some trachyte dykes. The oldest basaltts
are associated with the Oligocene lake deposits; and fragments of the
last mentioned are still preserved. The larger eruption formed the
lava-tains in the Highlands of eastern Victoria. The gravel revival
is in the works near Geelong and Portland, and on the shores of the
Gippsland lakes, which are occupied by 10,000 sq. m. of south-western Victoria.

There are three main areas of the coalfield: near Melbourne, the
railway for 166 m. from Melbourne to Warrnambool. The
volcanic craters built up by later eruptions are well preserved: such as
Mount Elephant, a simple breached cone; Mount Noorat, with a
lava-flowed crater; and Mount Fyffe, near Colac, with a large
Mount Warrenheip, near Ballarat, a single cone with the crater
bracheted to the north-west. Mount Franklin, standing on the
Oroclivick plans north of Daysley's, is a weathered cone bracheted
in the south-west. In addition to the volcanic craters, there are
numerous volcanic cinder cones supported by substrates, such as
Bullenmerri and Gootuk near Camperdown, Kilcambete near Terang, and
Togia. These conical structures of the Mount Bolingbroke shew
varying from a lake on its floor is a later
volcanic crater.

The Pleistocene, or perhaps Upper Pliocene, deposits of most interest
are found in association with the basaltts. One of the most
notable formations is that of Diprotodon and Palorchestes, which have been found near Geelong,
Castlemaine, Lake Kookungal, &c.; at the last locality Diprotodon
are associated to be seen in the ammonites of the base of the
the diplo. There is no trace in these deposits of the existence of
man, and J. W. Gregory has asserted the striking absence of
 evidence of man's residence in Victoria, except for a very limited
 period. There is no convincing evidence of Pleistocene glacial
deposits in Victoria. Of the many records, the only one that can
be still regarded as at all probable is that regarding Mount Bogong.
The chief literature on the geology of Victoria is to be found in the
volumes and publications of the Geological Survey—this, however,
the Mines Department. A map of the State, on the scale of eight
inches to the mile, was issued in 1902. The Survey has published
numerous maps, showing the tops of hills, the courses of rivers,
and the geological boundaries between the different parishes.
The geology is described in the Reports, Bulletins and Memoirs of the Survey, and in the Quarterly Reports of the Mining
Registrars.

Statistics of the mining industry are stated in the Annual Reports of the Survey. See also the summary of the geology of Victoria, by R. Murray, issued by the
Mines Department in 1887 and 1895. Numerous papers on the
geoology of the State are contained in the Trans. R. Soc. Victoria,
and on its mining geology in the Trans. R. Soc. Victoria and in
the Mining Engineers. The physical geography has been described
by W. G. Gregory in the Geography of Victoria (1903).

Victoria is the home of the Myer, being largely composed of
Eucalyptus or gum trees. There are several
hundred species, the most notable being Eucalyptus amygdalina, a
tree with white wood, smooth, as a marble column, and without
bracken. The wood is of the highest estimate in the gum and
is single. Eucalyptus globulus is a very common tree in
sheds, for these have all the appearance of lofty
pilled cathedrals. These trees are among the tallest in the world,
average in some districts about 300 ft. The longest ever
measured was found prostrate on the Black Spur; it measured
470 ft. in length; it was 81 ft. in girth near the root. Eucalyptus
globulosa or blue gum has broad green leaves, which yield
the eucalyptus oil of the pharmacopoeia. Eucalyptus rostrata is
extensively used in the colony as a timber, being popularly known as
red gum. It is very hard and durable and has a fine grain and
is almost indestructible when used as piles for piles or wharves.

The larger species of eucalyptus form the common "bush." Melaleuca
is probably the most widespread of the Eucalyptae, and is
found in many places along the coasts, where they grow densely on the sand-hills, forming "t-tree" scrub. Eucalyptus dumosa is a species which grows only 6 to 12 ft.
high, but with a straight stem; the trees grow so close together that they form a dense wall. They are found on
porous limestone. V. Eucalyptus acuminata, which has been taken up as an irrigation colony on California principles and laid
out in 40-acre farms and orchards. The Leguminosae are
chiefly represented by acacias, of which the wattle is the
most notable. The black wattle is of considerable value, its gum is being marketable
and its bark worth from $15 to $10 a ton for tanning purposes.
The golden wattle is a beautiful tree, whose rich yellow blossoms fill the
river-valleys in early spring with delicious scent. The Casuarina
or she-oaks are gloomy trees, of little use, but of frequent occurrence.

Heaths, grass-trees and magnificent fenns and ferns-trees are also
notable in the higher districts. The vegetation of the Southern districts is in
any region under the influence of a semi-tropical or a tropical heat.

Gaunt.—The indigenous animals belong almost wholly to the
Marsupialia. The Kangaroo, bandicoot and possum, and the
various wallabies, are widespread, and the destructive diseases of
the same class. The wombat forms extensive burrows in some
districts. The native bear is a frugivorous little animal, and very
numerous. The Possum is a large ratlike animal, which has been
introduced as a pest. The magpie, and the flying fox, very abundant in some districts. Eagles, hawks, thrushes,

pigeons, ducks, quail, snipe and plover are common; but the
characteristic denizens of the forest are the great flocks of parrots,
which are found in the southern forests. The laughing jackass (giant kingfisher) is heard in all the country
parts, and magpies are numerous everywhere. Snakes are numerous,
but less than one-fourth of the species are venomous, and they are
largely destroyed by the ferrets and other fowls. The kangaroo
and the wombat are the only native carnivores. A great change is rapidly taking place in the fauna of the
country, owing to cultivation and acclimatization. Dingoes have
nearly disappeared, and rabbits, which were introduced only a
few years ago, now abound in such numbers as to be a positive
nuisance. Deer are also rapidly becoming numerous. Sparrows
and swallows are as common as in England. The trout, which
have been acclimatized, is taking full possession of some of the
streams.

Climate.—Victoria enjoys an exceptionally fine climate. Roughly
speaking, about one-half of the days in the year present a bright,
cloudless sky, with a bracing and dry atmosphere, pleasantly warm
but not relaxing. These days are mainly in the autumn and
winter. During forty-eight years, ending with 1905, there have
never been more than seventy days during which temperatures averaged more
or less (chiefly in winter, but rainy days do not exceed thirty
in the year. The average yearly rainfall was 25-61 in. The
discreetible feature of the Victorian climate is the occurrence of
north winds, which blow on an average about sixty days in the
year. In winter they are cold and dry, and have a slightly depressing
effect; but in summer they are hot and dry, and generally bring
reflective heat and haze or clouds of dust. The winds themselves blow
for periods of two or three days at a time, and if the summer has
six or eight such periods it becomes relaxing and produces languor.

These winds cease with extraordinary suddenness, being replaced
in a few days by the very warm south-west winds. The temperature often falls 40° or 50°F. in an hour. The
maximum shade temperature at Melbourne in 1905 was 108-5°F.,
and the minimum 52°, giving a mean of 56-1°. The temperature
falling at sunset on the very hot days is considerable, and the
snow in the coldest month. Snow has been known to fall in
Melbourne for a few minutes two or three times during a long
period of years. It is common enough, however, on the plains of
Ballarat, which is over 1000 ft. high, always has a few snowstorms
and the roads to Omeo among the Australian Alps lie under several
feet of snow in the winter. The general healthiness of the climate
in the Melbourne district is due to the fact that the last
fifty years has been only 12-71 of the population.

Population.—As regards population, Victoria maintained the
leading position among the Australasian colonies until the end
of the last century. When New South Wales was the leading colony in
population in 1905 was 1,218,571, the proportion of the sexes being nearly
equal. In 1860 the population numbered 537,847; in 1870,
The number of illegitimate births in 1905 was 1,609, which gives a proportion of 5.6 to 100 births registered. The death rate has greatly improved. Arranged in quinquennial periods the death-rate was:

</table>

The marriages in 1905 numbered 8,774, which represents a rate of 7.2 per 1000 persons. This was the highest number reached during a period of 14 years, and was 564 more than in 1901 and 1169 more than in 1903. In the five years 1871-75 the marriage rate stood at 6.33 per 1000 in 1876-80, 6.02; in 1881-85, 7.77; in 1891-95, 5.13; in 1901-95, 6.96.

Outside Melbourne and suburbs, the most important towns areBallarat (49,643), Bendigo (43,666), Geelong (26,642), Castlemaine (8,683), Warrnambool (6,630), Maryborough (6,000) and Stawell (5,000).

**Religion.**—The Church of England, as disclosed at the census of 1901, had 43,704 adherents; the Roman Catholic Church came next with 26,310; the Presbyterians had 19,725; Wesleyans and Methodists, 18,272; Congregationalists, 17,141; Baptists, 32,648; Lutherans, 13,035; Jews, 9,997; and the Salvation Army, with Australian headquarters are in Melbourne, 8,950.

**Education.**—In 1905 there were 1,190 public schools, in which there were 210,200 children enrolled, the teachers numbering 4,699. There were also 771 private schools with 2,229 teachers and a net enrolment of 43,614 children; the majority of these being connected with one or other of the principal religious denominations. The total cost of primary instruction in 1905 was £67,244, as being 11.8d. per head of population and £4,145.40, per head of scholars in average attendance. Melbourne University maintains its high position as a teaching body. In 1905 the number of matriculants was 493 and the graduates 118.

Crime is decreasing. In 1905 the number of persons brought before the magistrates was 14,345. Drunkenness accounted for 14,458, which represents 11.92 per 1000 of the population; in 1901 the proportion was 14.13. Charges against the person numbered 1952, and against property 4032.

**Administration.**—As one of the six states of the Commonwealth, Victoria returns six senators and twenty-three representatives to the federal parliament. The local legislative authority is vested in a parliament of two chambers, both elective—the Legislative Council, composed of thirty-five members, and the Legislative Assembly, composed of sixty-eight members. One-half of the members of the Council retire every three years. The members of the Assembly are elected by universal suffrage for the term of three years, but the chamber can be dissolved at any time by the Governor in council. Members of the Assembly are paid £300 a year.

The whole of Victoria in 1905 was under the control of municipalities, with the exception of about 300 sq. m. in the mountainous part of Wonangatta, and 64 sq. m. in French Island. The number of municipalities in that year was 206; they comprised 11 cities, 11 towns, 38 boroughs and 146 shires.

**Finance.**—The public revenue in 1905 showed an increase on that of the three previous years, being £7,515,142, equal to £6,48.4d. per head of population; the expenditure amounted to £5,343,742, which showed a slight increase and was equal to £4.10. 4d. per inhabitant. The public debt in 1861 was £18,000, £4,621,282; 1885, £6,396,381; 1895, £8,519,159; 1897, £8,724,312; and in 1901, £9,722,392. The chief sources of revenue in 1905 were licences, £2,017,378; other taxation, £792,029; railway receipts, £5,660,720; agricultural lands, £408,836; other sources, £501,379. The main items of expenditure were railways (working expenses), £2,004,601; public instruction, £158,274; religion, £50,370; other services, £2,793,139. On the 30th of June 1905 the public debt of the state stood at £51,513,767, equal to £42.96.7d. per inhabitant. The great bulk of the proceeds of loans was applied to the reconstruction of railways and of other works, only about three million dollars being otherwise used.

Up to 1905 the state had allocated 26,546,802 acres of the public domain, and had 17,094,233 acres under the area neither alienated nor leased amounted to 11,904,725 acres.

The capital value of properties as returned by the municipalities in 1905 was £210,920,174, and the annual value £11,743,276. In 1905 the property owners paid £59,572, the revenues of the municipalities in the 2nd quarter was £5,161,328; the gross amount of taxation levied in Victoria in 1904 was £2,488,843, the state government £9,079,029, the municipalities £968,009, and the Melbourne Harbour Trust £199,083. The Melbourne and Metropolitan Board of Works, £90,441; Fire Boards, £53,797. The Board of Works is the authority administering the metropolitan water and gas works. Excluding government endowments and special grants, which in 1905 amounted to £90,572, the revenues of the municipalities in the 2nd quarter was £5,161,328; the gross amount of taxation levied in Victoria in 1904 was £2,488,843, the state government £9,079,029, the municipalities £968,009, and the Melbourne Harbour Trust £199,083.

**Provisions and Industry: Minerals.**—About 25,000 persons find employment in the goldfields, and the quantity of gold won in 1905 was 810,090 oz., valued at £1,773,744, a decrease of 10,067 oz. as compared with 1904. The dividends paid by gold-mining companies in 1905 amounted to £45,431, which, although about the average of recent years, showed a decline of £100,000 as compared with the amount distributed in 1904. Up to the close of 1905 the total value of gold won from the first discovery in 1851 was £273,250,000. No other metallic minerals are systematically worked, although many valuable deposits are known to exist. Brown coal, or lignite, is found in varying quantity, an important supply being mined at Wonthaggi, near the mouth of the Gippsland district. The production of coal in 1905 was 155,185 tons, valued at £29,060; £4100 worth of silver and £1,115 worth of tin were raised; the value of other minerals won was £63,920, making a total mineral production (exclusive of gold) of £187,711.

**Agriculture.**—Judged by the area under tillage, Victoria ranks first among the states of the Australian group. The area under crop in 1905 was 1,466,577 acres, compared with 2,116,000 acres in 1901 and 1,435,000 acres in 1881. Wheat-growing claims the chief attention, 2,070,517 acres being under that cereal in 1905. The produce in 1905 was equal to other years, as follows: wheat, 1,040,100 bushels; oats, 312,052 acres; barley, 40,338 acres; other cereals, 14,212 acres; hay, 591,771 acres; potatoes, 44,670 acres; vines, 26,402 acres; olive groves, 34,941 acres; other tillage, 73,574 acres; land in cultivation, 1,047,153 acres; the produce was of unusually fine quality, and usually commands a high price in the London market. The average yield per acre in 1905 was 11.31 bushels; the yield for the year 1904 was 11.28 bushels, and for the year 1900 the average yield per acre was 11.17, while in 1901 and 1902 the highest yields were obtained. The yield of oats was 23.18 bushels per acre, of barley 25.95, and of potatoes 2.58 tons. Great progress has been made in the cultivation of the grape vine, and in 1904 the area was increased to 12,000 acres, and the yield now produces more than one-third of the wine made in Australia.

**Live Stock.**—The number of sheep in 1905 was 11,455,115. The quality of the sheep is steadily improving. Systematic attention has been brought to the improvement of the sheep in the early period since 1864, and careful observations show that between 1861 and 1871 the average weight of wool per sheep increased about one-third; between 1871 and 1881 about one pound was added to the weight.
per fleece, and there has been a further improvement since the year named. The following were the number of sheep depastured at the different pastoral districts for 1890: Bendigo 197,000; Port Elliot, 189,129,000; 1901, 101,841,790. The horses numbers 385,513, the swine 273,682, and the horned cattle 1,737,690; of these last, 647,382 were of the Brahman breed. Beef-making has grown since 1890, and a fairly large export trade has arisen. In 1905, 57,606,821 lb of butter were made, 4,297,350 lb of cheese and 16,433,665 lb of bacon and hams.

The wool trade has been a good deal of fluctuation in the amount of employment afforded by the factories, as the following figures show: hands employed, 1885, 49,297; 1890, 36,639; 1893, 39,473; 1895, 46,095; 1900, 64,207; 1905, 80,235. Of the hands laboring in 1905, 54.3% were male and 45.7% female. The number of establishments was 4,264, and the horse-power of machinery actually used, 43,492. The value of machinery was returned at $30,497,130, and the land and buildings $7,772,218. The majority of the establishments were small; those employing from 50 to 100 hands in 1905 were 161, and upwards of 100 hands, 124.

Commerce.—Excluding the coastal trade, the tonnage of vessels entering Victorian ports in 1890 was $5,899,093, or about 34% tons per inhabitant. The imports in the same year were valued at $22,337,886, and the exports at $27,758,828. These figures represent 18.8, 25.3, and 18.6% per inhabitant respectively. The domestic produce exported was valued at $14,427,661; in 1891 the value was $13,026,426; and in 1891, $12,490,567. The comparatively small increase over the period named is due to the large fall in prices of the staple articles of local production. There has, however, been a marked increase in the cultivation of tobacco by the New South Wales government in extending its railways into districts formerly supplied from Melbourne. The principal articles of local production exported from Victoria, with their wholesale values were as follows: cheese, $1,576,189; gold (coined and bullion), $1,078,560; wheat, $1.835,204; frozen mutton, $755,195; frozen and preserved rabbits and hares, $230,940; skins and hides, $335,808; wool, $2,501,990; hides, $277,489; gold-dust, $9,600; soap, $9,550; barley, $76,886; hogsheads of wine, $165,858; flour, $59,397; hay and chaff, $75,471; bacon and ham, $89,643; jams and jellies, $73,233; fruit (dried and fresh), $125,332. The bulk of the trade passes through Melbourne, the imports at the port in 1905 being $18,112,828.

Defence.—The Commonwealth defence forces in Victoria number about 5,700 men, 4,360 being partially paid militia and 1,340 unpaid volunteers. The state of the army and navy is as follows: 6 officers, 184 other ranks, and 29,400 men. There are 11,400 men, 17,400 women, and 10,000 children belonging to rifle clubs. Besides these there are 200 naval artillerymen, men, capable of being employed either as a light artillery land force, or on board war vessels. The total expenditure in 1905 for purposes of defence in the state was $291,577.

Railways.—The railways have a total length of 3,394 m., and the cost of their construction and equipment up to the 30th of June in 1905 was $41,259,387; this sum was obtained by raising loans, mainly in London, and the security of the general revenues of the state. In 1905 the gross railway earnings were $3,582,266, and the working expenses $2,222,279; so that the net earnings were $1,359,987, which sum represents 3.5% on the capital cost.

Agriculture.—Victoria has a length of 634 miles of telegraph line in operation in 1905; there were 969 stations, and the business done was represented by 2,256,482 telegrams. The post-offices, properly so-called, numbered 1,673; during that year 11,286,240 letters were passed through them, and 17,795,000 postcards. The postal service is carried on at a profit; the revenue in 1905 was $705,396, and the expenditure $733,713. Telephone services are widely used. (Of 9,050 the 1,805 to 1869; Edmund Finn, Chronicles of Early Melbourne (Melbourne, 1889); Philip Mennell, The Dictionary of Australasian Biography (Melbourne, 1892); T. A. Coghlan, Australia and New Zealand (1903). (T. A. C.)

History.—The first discover of Victoria was Captain Cook, in command of H.M.S. "Endeavour," who sighted Cape Everard, about half-way between Cape Howe and the mouth of the Snowy river, on the 19th of April 1770, a few days prior to his arrival at Botany Bay. The first persons to land in Victoria were the supercargo and a portion of the crew of the merchant ship "Sydney Cove," which was wrecked at the Furneaux Islands in Bass Strait on the 6th of February 1797. In the same year, Mr Bass, a surgeon in the navy, discovered the strait which bears his name and separates Victoria from Tasmania. Lieut. Grant in the "Lady Nelson" surveyed the south coast in 1800, and in 1801 Port Phillip was for the first time entered by Lieut. Murray. In 1802 that harbour was surveyed by Captain Flinders, and in the same year Mr Grimes, the surveyor-general of New South Wales, explored the country in the neighborhood of the present site of Melbourne. In 1804 Lieut.-Colonel Collins, who had been sent from England, formed a penal settlement on the shores of Port Phillip, but after remaining a little more than three months near Indented Head, he removed his party to Van Diemen Land. Victoria was visited in 1824 by two sheep farmers named Hume and Hovell, who rode overland from Lake George, New South Wales, to the shores of Corio Bay. In 1826 a convict establishment was attempted by the government of New South Wales at Port Phillip Point, on the Corio Bay, but it was abandoned shortly afterwards. In 1834 Messrs Edward and Francis Henty, who had taken part in the original expedition to Swan river, West Australia, and afterwards migrated to Van Diemen Land, crossed Bass Strait, established a shore whaling station at Portland Bay, and formed sheep and cattle stations on the river Wannon and Wando rivulet, near the site of the present town of Merino, Casterton and Coleraine. In 1835 a number of flock owners in Van Diemen Land purchased through Batman from the aborigines a tract of 700,000 acres on the shores of Port Phillip. The sale was repudiated by the British government, and all unoccupied land in any part of Australia as the property of the crown, and did not recognize the title of the aborigines. Batman, however, remained at Port Phillip, and commenced farming within the boundaries of the present city of Melbourne. He was followed by John Pascoe Fawkner and other settlers from Van Diemen Land, who occupied the fertile plains of the new territory. In 1836 Captain Lonsdale was sent to Melbourne by the government of New South Wales to act as resident magistrate at Port Phillip. The first census taken in 1838 showed that the population was 5,511, of whom 3,080 were males and 2,431 females. In 1839 Mr Latrobe was appointed superintendent of Port Phillip, and a resident judge was nominated for Melbourne, with jurisdiction over the territory which now forms the state of Victoria. The years 1839 and 1841 were periods of depression owing to the decline in the value of all descriptions of live stock, for which the first settlers had paid high prices; but there was a steady immigration from Great Britain of men with means, attracted by the profits of sheep-farming, and of labourers and artisans who obtained free passages under the provisions of the Wakefield system. This was the period when the public lands were sold in the state by auction, and when large tracts were purchased by companies. In 1839 the plan of colonization was put into action in the state, and in 1841 the population had increased to 11,738. Melbourne was incorporated as a town in 1842, and was raised to the dignity of a city in 1847. In that same year the first Anglican was ordained, and in 1848 the first Roman Catholic bishop. The third census (taken in 1846) showed a population of 32,870.

The elective element was introduced into the Legislative Council of New South Wales in 1843, when the colony was thrown open to the franchise of twenty-four members to twelve nominated by the crown, and the district of Port Phillip, including Melbourne, returned six members. But the colonists were not satisfied with government
from and by Sydney; an agitation in favour of separation commenced, and in 1851 Victoria was formed into a separate colony with an Executive Council appointed by the crown, and a Legislative Council, partly elective and partly nominated, on the same lines as that of New South Wales. The population at that date was 77,435. Gold was discovered a few weeks after the colony had entered upon its separate existence, and a large number of persons were attracted to the mines, first from the neighbouring colonies—some of which, such as South Australia, Van Diemen's Land and West Australia, were almost denuded of able-bodied men and women—and subsequently from Europe and America. The administration of the gold-fields was closely watched by the central government, which had to contend, the task of maintaining law and order was fairly grappled with; the foundations of a liberal system of primary, secondary and university education were laid; roads, bridges and telegraphs were constructed, and Melbourne was provided with an excellent supply of water. 

Local self-government was introduced in 1853, and the Legislative Council was able to discuss a new Constitution, which not only eliminated the nominee element from the Legislative Council, but made the executive government responsible to the people. The administration of the gold-fields was no longer left to the miners, and payment at a low rate for permission to mine for gold, and at that being no representation for the gold-fields in the local Legislative Council. The discontent culminated, at Ballarat in December 1854, in riots in which there was a considerable loss of life both amongst the miners and the troops. Eventually, an export duty on gold was substituted for the licence fee, but every miner had to take out a right which enabled him to occupy a limited area of land for mining, and also for residence. The census taken in 1854 showed the population of 236,778. The new Constitution was popular in 1855, and the old Legislative Council was gazetted as the first responsible ministry. It held office for about sixteen months, and was succeeded by an administration formed from the popular party. Several changes were made in the direction of democratizing the government, and vote by ballot, manhood suffrage and the abolition of the property qualification followed each other in rapid succession. To several of these changes there was strenuous opposition, not so much in the Assembly which represented the manhood, as in the Council in which the property of the colony was supreme. The crown lands, which were the original squatters. But a sufficient number of grazing men were held under a licence renewable annually at a low rental. These licences were very valuable, and the goodwill of a grazing farm or "run" commanded a high price. Persons who desired to acquire freehold for the purpose of tillage could only do so by purchasing the land at auction, and the local squatters, unwilling to be deprived of any portion of a valuable property, were generally willing to pay a price per acre with which no person of small means desirous of embarking upon agricultural pursuits could compete. The result was that although the population had increased in 1861 to 340,322, the area of land under crop had not grown proportionately, and Victoria was dependent upon the neighbouring colonies and even more distant countries for a considerable portion of its food. A series of Land Acts was passed, the first in 1860, with the view of encouraging a class of small freeholders. The principle underlying all these laws was that residence by landowners on their farms, and their cultivation, were more important to the state than the sum realized by the sale of the land. The policy was only partially successful, and by a number of ingenious evasions a large proportion of the best land in the colony passed into the possession of the original squatters. But a sufficient proportion was purchased by small farmers to convert Victoria into a great agricultural country, and to enable it to export large quantities of farm and dairy produce.

The greater portion of the revenue was raised by the taxation through the customs of a small number of products, such as spirits, tobacco, wine, tea, coffee, &c. But an agitation arose in favour of such an adjustment of the import duties as would protect the manufacturers which at that time were being commenced. A determined opposition to this policy was made by a large minority in the Assembly, and by a large majority in the Council, but by degrees the democratic party triumphed. The victory was not gained without a number of political crises which shook the whole fabric of society to its foundations. The Assembly tackled the tariff to the Appropriation Bill, and the Council threw out both. The result was that there was no legal means of paying either the civil servants or the contractors, and the government had recourse to an ingenious though questionable system by which advances were made by a bank which was recouped through the crown conferring on it that it would hold the government's account, and deduct from its payment for any recovery to parliament. Similar opposition was made by the Council to payment of members, and to a grant made to Lady Darling, the wife of Governor Sir Charles Darling, who had been recalled by the secretary of state on the charge of having shown partiality to the democratic party. Indeed on one occasion the dispute between the government and the Council was so violent that the former dismissed all the police, magistrates, county court judges and other high officials, on the ground that no provision had been made by the Council, which had thrown out the Appropriation Bill.

Notwithstanding these political struggles, the population of the colony steadily increased, and the Legislature found time to pass some measures which affected the social life and the commercial position of the colonies. State aid to religion was abolished, and divorce was made comparatively easy. A system of free, compulsory and secular primary education was introduced. The import duties were increased and the transfer of land was simplified. In 1880 a fortnightly mail service via Suez between England and Melbourne was introduced, and in 1887 the first International Exhibition ever held in Victoria was opened. In the following year the census showed a population of 862,346, of whom 452,883 were males and 410,263 females. During the same year the lengthy dispute between the two houses of parliament, which had caused so much inconvenience, so many heartburnings and so many political crises, was brought to an end by the passage of an act which reduced the qualifications for members and the election of the Legislative Council, shortened the tenure of their seats, increased the number of provinces to fourteen and the number of members to forty-two. In 1883 a coalition government, in which the Liberal or protectionist and the Conservative or free-trade party were represented, took office, and with some changes remained in power for seven years. During this political truce several important changes were made in the Constitution. An act for giving greater facilities for divorce was passed, and with some difficulty obtained the royal assent. The Victorian railways were handed over to the control of three commissioners, who to a considerable extent were made independent of the government, and the civil service was placed under the supervision of an independent board. In 1887 the representatives of Victoria met those of the other British colonies and of the United Kingdom in London, under the presidency of Lord Knutsford, in order to discuss the questions of defence, postal and telegraphic communication, and the contribution of Australia to the Imperial navy. In 1888 a weekly mail service was established via Suez by the steamers of the P. & O. and the Orient Companies, and the second Victorian International Exhibition was opened. In 1890 all the Australian colonies, including New South Wales and New Zealand, sent representatives to a conference at Melbourne, at which resolutions were passed in favour of the establishment of a National Australian Convention empowered to consider and report upon an adequate scheme for the Federal Constitution. This Convention met in Sydney in 1891 and took the first step towards federation (see AUSTRALIA).

In 1891 the coalition government resigned and a Liberal administration was formed. An act passed in that year placed the railways again under the control of the government. Measures of a democratic and collectivist tendency have since obtained the assent of the Legislature. The franchise of
property-holders not resident in an electorate was abolished and the principle of "one man one vote" was established. Acts have been passed sanctioning Old Age Pensions; prohibiting shops, except those selling perishable goods, from keeping open more than eight hours; compelling the proprietors to give their assistants one half-holiday every six days; preventing persons from working more than forty-eight hours a week; and appointing for each trade a tribunal composed of an equal number of employers and employed to fix a minimum wage. (See Australia.)

Victoria enjoyed a large measure of prosperity during the later 'eighties and earlier 'nineties, and its financial prosperity enabled the government to expend large sums in extending railway communication to almost every locality and to commence a system of irrigation. The soil of Victoria is on the whole more fertile than in any other colony on the mainland of Australia, and in no portion of the continent is there any locality equal in fertility to the western district and some parts of Gippsland. The rainfall is more equitable than in any portion of Australia, but the northern and north-western districts, which are the most remote from the sea and the Dividing Range, are subject to droughts, which, although not so severe or so frequent as in the interior of the continent, are sufficiently disastrous in their effects. The results of the expenditure upon irrigation have not been so & successful as was hoped. Victoria has no mountains covered with snow, which in Italy and South America supply with water the rivers at the season of the year when the land needs irrigation, and it was necessary to construct large and expensive reservoirs. The cost of water is therefore greater than the ordinary agriculturist who grows grain or breeds and fattens stock can afford to pay, although the price may not be too high for orchardists and vine-growers. In 1892 the prosperity of the colony was checked by a great strike which for some months affected production, but speculation in land continued for some time longer, especially in Melbourne, which at that time contained nearly half the population, 900,000 out of a total of 1,140,105. There does not seem to have been any other reasons for this increase in land values, for there was no immigration, and the value of every description of produce had fallen—except that the working classes were prosperous and well paid, and that the purchase of small allotments in the suburbs was a popular mode of investment. In 1893 there was a collapse. The value of land declined enormously, hundreds of persons believed to be wealthy were ruined, and there was a financial panic which caused the suspension of all the banks, with the exception of the Australasia, the Union of Australia, and the New South Wales. Most of them resumed payment, but three went into liquidation. It was some years before the normal condition of prosperity was restored, but the great resources of the colony and the energy of its people discovered new markets, and new products for them, and enabled them materially to increase the export trade.

VICTORIA, a city and port of Brazil, capital of the state of Espiritu Santo, on the W. side of an island at the head of the Bay of Espiritu Santo, 270 m. N.E. of Rio de Janeiro, in lat. 20° 18' S., long. 46° 20' W. Pop. (1902, estimated) 9000. The city occupies the beach and talus at the base of a high, wooded mountain. The principal streets follow the water-line, rising in terraces from the shore, and are crossed by narrow, steep, roughly paved streets. The buildings are old and of the colonial type. The governor's residence is an old convent, with its church at one side. The entrance to the bay is rather tortuous and difficult, but is sufficiently deep for the largest vessels. It is defended by five small forts. The harbour is not large, but is safe and deep, being completely shut in by hills. A large quay, pier, warehouses, &c., facilitate the handling of cargoes, which were previously transported to and from the anchorage by lighters. Victoria is a port of call for coasting steamers and a shipping port in the coffee trade. The other exports are sugar, rice and mandioc (manioc) to home ports.

Victoria was founded in 1535 by Vasco Fernando Coutinho, on the S. side and nearer the entrance to the bay, and received the name of Espiritu Santo. The old site is still occupied, and is known as Villa Velha (Old Town). The name of Victoria was adopted in 1558 in commemoration of a crushing defeat inflicted by Fernando da Sa on the allied tribes of the Aimorés, Tapirequins and Goitacazes in that year. It was attacked (1592) by the freebooter Cavendish, who was repelled by one of the forts at the entrance to the bay.

VICTORIA, the capital of British Columbia and the principal city of Vancouver Island, in the S.E. corner of which it is finely situated (48° 25' 26" N., 123° 22' 24" W.), on a small arm of the sea, its harbour, however, only admitting vessels drawing 18 ft. Pop. (1906) about 25,000. It is the oldest city in the province. It has fine streets, handsome public buildings, government offices and churches. The high school is affiliated with McGill University, in Montreal. Victoria is connected with the mainland by cable, and is a favourite tourist resort for the whole west coast of North America. Till 1858 Victoria was a post of the Hudson's Bay Company. The city was incorporated in 1862, and according to the census of 1880 the population was 14,000, including Chinese and Indians; spread over an area of 4 sq. m. Until the redistribution of the fleet in 1905, the headquarters of the British Pacific squadron was at Esquimalt, a fine harbour about 3 m. W. of Victoria. This harbour, though spacious, is not much used by merchant vessels. It is provided with a large dry-dock and is defended by fortifications of a modern type.

VICTORIA FALLS, the greatest waterfall in the world, forming the most remarkable feature of the river Zambezi, Central Africa. The falls are about midway in the course of the Zambezi in 15° 51' S., 25° 41' E. For a considerable distance above the falls the river flows over a level sheet of basalt, its valley bounded by low and distant sandstone hills. Its clear blue waters are dotted with numerous tree-clad islands. These islands increase in number as the river, without quickening its current, approaches the falls, whose nearness is indicated only by a veil of spray. At the spot where the Zambezi is at its widest—over 1800 yds.—it falls abruptly over the edge of an almost vertical chasm with a roar as of continuous thunder,
sending up vast columns of vapour. Hence the native name Musi-o-itu, "Smoke does sound there." The chasm extends the whole breadth of the river and is more than twice the depth of Niagara, varying from 250 ft. at the right bank to 375 ft. of the left. Unlike Niagara the water does not fall into an open basin but is arrested at a distance of from 80 to 240 ft. by the opposite wall of the chasm. Both walls are of the same height, so that the falls appear to be formed by a huge crack in the bed of the river. The only outlet is a narrow channel cut in the barrier wall at a point about three-fifths from the western end of the chasm, and through this gorge, not more than 100 ft. wide, the whole volume of the river pours for 130 yds. before emerging into an enormous zigzag trough (the Grand Cañon) which conducts the river past the basin plateau. The pressure with which the water is subjected in the confinement of the chasm causes the perpetual columns of mist which rise over the precipice.

The fall is broken by islands on the lip of the precipice into four parts. Close to the right bank is a sloping cataract 36 yds. wide, called the Leaping Water, then beyond Boaruka Island, about 300 yds. wide, is the Main Fall, 473 yds. broad, and divided by Livingstone Island from the Rainbow Fall 535 yds. wide. At both these falls the rock is sharp cut and the river maintains its level to the edge of the precipice. At the left bank of the river is the Eastern Cañon, a mile long, blocking the Least Water. From like Niagra the western end of the falls to Danger Point, which overlooks the entrance of the gorge, the escarpment of the chasm is covered with great trees known as the Rain Forest; looking across the gorge the eastern part of the wall (the Knife Edge) is less densely wooded.

At the end of the gorge the river has hollowed out a deep pool, named the Boiling Pot. It is some 500 ft. across; its surface, smooth at low water, is at flood-time troubled by slow, enormous swirls and heavy boilings. Hence the channel turns sharply westward, beginning the great zigzag mentioned. This is about 1 mile long. In unbroken height the perpendicular walls are over 400 ft. high, the level of the escarpment being that of the lip of the falls. A little below the Boiling Pot, and at almost right angles to the falls, the cañon is spanned by a bridge (completed in April 1905) which forms a link in the Cairo railway scheme. This bridge, 65 ft. long, with a main arch of 500 ft. span, is slightly below the top of the gorge. The height from low-water level to the rails is 420 ft.

The volume of water borne over the falls varies greatly, the level of the river in the upper lake being almost as much as 60 ft. between the full flood of April and the end of the dry season in October. When the river is high the water rolls over the main falls in one great unbroken expanse; at low water (when alone it is possible to look into the grey depths of the great chasm) the falls are broken by crevices in the rock into numerous cascades.

The falls are in the territory of Rhodesia. They were discovered by David Livingstone on the 17th of November 1855, and by him named after Queen Victoria of England. Livingstone approached them from above and gained his first view of the falls from the island on its lip now named after him. In 1905 Dr. John Pinto, marine botanist of the South African Institute, made a careful investigation of the falls, but, until the opening of the railway from Bulawayo (1905) they were rarely visited. The land in the vicinity of the falls is preserved by the Rhodesian government as a public park.

fluctuations, which has its rise in the hill country east of Lake Kyus, and enters the west side of the nyanza just north of 1° S., is described in the treatise De Definitionibus (ed. T. Stangl in Tulliana et Mariae-Victoriana, Munich, 1893), and in other treatises. The other rivers entering Victoria Nyanza from the west are the Katonga and Ruizi, both north of the Kagera. The Katonga rises in the plateau east of the Dkea branch of the river Eastern Nyanza, and after a course of 155 miles enters Victoria Nyanza as a swift and swamp at its N.W. corner. The Ruizi (180 m.) is a deep, wide and swift stream with sinuous course flowing in part through great gorges, which is the source of the Victoria Nile. Other large rivers rise in the district and reaches the nyanza a little north of the Kagera. Between the Katonga and the Nile outlet, the rivers which rise close to the lake drain away northward, the watershed being the lake shore of the Victoria Nile, and both the main and overflowed streams reach the lake—notably the Sio, Nzoia and Lukos (or Yala). The Nzoia (150 m.), the largest of the three, rises in the Elgon Park. The Elgon Park, traversing an area of over a rocky bed in a south-western direction, emptying into the lake south of Berkley Bay. On the east side the Mara Dabaghi enters the lake between 1° and 2° S. It is, next to the Kagera, the largest of the lake tributaries. All the rivers mentioned are perennial, and most of them bring down a considerable volume of water, even in the dry season. On the S. E. and S.W. shores a number of short rivers drain into the lake. They traverse a tree less and arid region, have but an intermittent flow, and are of little importance in the hydrography of the district. The only outlet of the lake is the Nile (q.v.).

Area and Lake Level.—The very important part played by the Victoria Nyanza in the Nile system has led to careful study of its drainage basin and rainfall and the perplexing variations in the level of the lake. The area drained by the lake covers, with the Nile itself, the area of 15,000 square miles, of which 14,500 square miles are grassy districts, and a considerable portion is somewhat arid tableland. According to the calculations of Sir William Garstin the rainfall over the whole area averages 50 in. a year. Allowing that as much as 25% of this amount enters the lake, this is equivalent to a total of 3,750,000,000 cub. metres in a year. Measurements at the Ripon Falls show that 18,000,000,000, or some 15% of this amount, enters the Nyanza lake, and some allowance has been made for the annual rise and fall of the lake-level is apparent that by far the greater part of the water which enters the nyanza is lost by evaporation; in fact, that the amount drawn off by the Nile is only a small part in the total fluctuation of the level, and that a large amount of rain falls on the water surface. Rain falls more or less in every month, but is heaviest during March, April, May and again in September, October and November. The level of the lake is chiefly affected by the autumn falls and generally reaches its lowest maximum in July. The annual rise and fall is on an average from 1 to 3 ft., but between November 1900 and June 1901 a difference of 42 in. was recorded. Considerable speculation was caused by the fact that whereas in 1878-79 the lake level was high, from 1880 to 1890 the level was falling, and that after a few years (1892-95) of higher level there was, from 1896 to 1900, again a gradual fall leading in successive years to new records. Sir William Garstin attributes the cause to deficient or excess of rainfall. Any secular sinking of the lake in common with the lakes of Central Africa generally must be so gradual as to have no practical importance. It must also have been noticed in such a lake as Nyaza that the wind exercises an influence on the level, tending to pile up the water at different parts of the lake. The winds may also be the cause of the daily variation of level, which on Speke Gulf has been found to reach 20 in.; but this may also partake of the character of a "seiche." Currents setting towards the north or north-west have been observed in various parts of the lake.

Discovery and Exploration.—The quest for the Nile sources led to the discovery of the lake by J. H. Speke in 1858, and it was by Speke and his companion, J. A. Grant, in 1862, that the Cf. the N.W. shore, leaving the lake at the Nile outlet. Great differences of opinion existed as to its size until its circumnavigation in 1874 by H. M. Stanley, which proved it to be of vast extent. The invitation sent by King Mtesa of Uganda through Stanley to the Christian missionaries led to the dispatch from England in 1876 of the Rev. C. T. Wilson, to whom we owe our first detailed knowledge of the nyaza. Mr Wilson and Lieut. Shergold Smith, R.N., made, in 1877, the first voyage across the nyaza in the E.M. weyhe. Some years later members of the Church Missionary Society, were in the same year murdered on Ukerebe Island. In 1880 Stanley further explored the lake, discovering Emin Pasha Gulf, the entrance to which is masked by several is. In 1890 the ownership of the lake was divided by Great Britain and Germany, the first degree of south latitude being taken as the boundary line. The southern portion, which fell to Germany, was visited and described by scientists of that nation, whose objects, however, were not primarily geographic. At the instance of the British Foreign Office a survey of the southern shores of the lake was carried out in 1899-1900 by Commander B. Whitehouse, R.N., as a special officer, in 1903, undertook, in agreement with the German government, a survey of the southern shores. Commander Whitehouse's work led to considerable modification of the previously accepted maps. He discovered numerous islands and bays whose existence had previously been unknown. Previously to 1896 navigation was confined to Arab shawls, which trade took place on the south end of the lake and Uganda, and to canoes. In the year named a small steamer (the "Ruwenzori") was launched on the lake by a Zanzibar firm, while in 1900 a somewhat larger steamer (the "William Mackinnon"), built in Glasgow at the instance of Sir W. Mackinnon, and afterwards taken over by the British government, made her first trip on the lake. In 1903, the year in which the railway from Mombasa to the lake was completed, a steamer of 600 tons burden was launched at Port Florence. Since that date trade has considerably increased.

See Nile and Uganda and the British Blue-book Egypt No. 2 (1904), which is a report by Sir Wm. Garstin upon the Basin of the Uganda Nile. This report contains the most important information upon the Victoria Nyanza, summarizes the information of previous travellers, whose works are quoted. In 1908 the British Admiralty published a chart of the lake (scale 4 in. to the mile). The survey was made by a special party to the survey, which include: C. T. Wilson, Uganda and the Soudan (London, 1882); (Sir) F. D. Lugard, The Rise of our East African Empire, London, 1896; (Sir) H. E. Stanley, Mtn Emin Pasha, &c, &c. (Berlin, 1894); Paul Kollmann, "The Victoria Nyanza" (English translation; London, 1890); E. G. Ravenstein, "The Lake-level of the Victoria Nyanza," Geographical Journal, October 1901; Sir H. H. Johnston, "The Uganda Protectorate" (London, 1902). In most of these publications the descriptions of the lake occupy but a small part. (W. E. G.; F. R. C.)

VICTORINUS, GAUDE MARIUS (4th century A.D.), Roman grammarian, rhetorician and neo-Platonic philosopher, an African by birth (whence his surname Afer), lived during the reign of Constantius II. He taught rhetoric at Rome (one of his pupils being Jerome), and in his old age became a convert to Christianity. His conversion is said to have greatly influenced that of Augustine. When Julian published an edict forbidding Christians to lecture on polite literature, Victorinus closed his school. A statue was erected in his honour as a teacher in the Forum Trajanum.

His translations of platonic writers are lost, but the treatise De Definitionibus (ed. T. Stangl in Tulliana et Mariae-Victoriana, Munich, 1893) is properly a commentary, containing much original material. His man of prose, in four books, taken almost literally from the work of Aphthonius, is extant (H. Heil, Grammatici Latini, v. ); it is doubtless whether he is the author of certain other extant treatises attributed to him on metrical and grammatical subjects, which will be found in Heil. His commentary on Cicero's De Inventione (in Halm's Rhetorei Latinorum adjecta) has been lost and is itself in need of commentary. His extant theological writings, which will be found in J. F. Migne, Corpus Patrologiae Latinae, vi, include commentaries on Galatians, Ephesians and Philippians; De Trinitate contra Arius; Justice and Nature: a question already raised by Plotinus. In the little tract on "The Evening and the Morning were one day" (the genuineness of the last two is doubtful). Some Christian poems which he prefixed to the name of Victorinus are probably not his.

See G. Geiger, C. Marius Victorinus Aen, ein neuplatonischer Philosoph (Metten, 1888); G. Koffmann, De Mario Victorino philosopho Christiano (Breslau, 1888); R. Schmid, Marius Victorinus Rhetor et seine Beziehungen zu Augustinus (in Dictionary of Christian Biography, iv, M. Schanz, Geschichte der römischen Literatur, iv, 1 (1904); Teuffel, Hist. of Roman Literature (Eng. tr., 1900), 408.

VICTOR-PERRIN, CLAUDE DEKSF BELLON (1764-1841), marshal of France, was born at La Marche, Vosges, on Mr. G. Henry, on November 30, 1764. In 1788 he entered the army as a private soldier, and after ten years' service he received his discharge and settled at Valence. Soon afterwards he joined the local volunteers, and distinguishing himself in the war on the Alpine frontier, in less than a year he had risen to the
command of a battalion. For his bravery at the siege of Toulon in 1793 he was raised to the rank of general of brigade. He afterwards served for some time with the army of the Eastern Pyrenees, and in the Italian campaign of 1796-97 he so acquitted himself at Mondovi, Roveredo and Mantua that he was promoted to be general of division. After commanding for some time the viceroyalty of La Vendée, he was again employed in Italy, where he did good service against the papal troops, and he took a very important part in the battle of Marengo. In 1802 he was governor of the colony of Louisiana for a short time, in 1803 he commanded the Batavian army, and afterwards he acted for eighteen months (1805-6) as French plenipotentiary at Copenhagen. On the outbreak of hostilities with Prussia he joined the V. army corps (Marshal Lannes) as chief of the general staff. He distinguished himself at Saalfeld and Jena, and at Friedland he commanded the L. corps in such a manner that Napoleon gave him the marshalate. After the peace of Tilsit he became governor of Berlin, and in 1808 he was created duke of Belluno. In the same year he was sent to Spain, where he took a prominent part in the Peninsular War (especially at Espinosa, Talavera, Barrosa and Cadiz), until his appointment in 1812 to a corps command in the invasion of Russia. Here his most important service was in protecting the retreating army at the crossing of the Beresina. He took an active part in the wars 1813-14, till in February of the latter year he had the misfortune to arrive too late at Montecucco-sur-Yonne. The result was a scene of violent recrimination, and his supersession by the emperor; he transferred his command to Gérard. Thus wounded in his amour-propre, Victor now transferred his allegiance to the Bourbon dynasty, and in December 1814 received from Louis XVIII. the command of the second military division. In 1815 he accompanied the king to Ghent, and on the second restoration he was made a peer of France. He was also president of a commission which inquired into the conduct of the officers during the Hundred Days, and dismissed Napoleon's sympathizers. In 1821 he was appointed war minister and held this office for two years. In 1825 he was made major-general of the royal guard, and after the revolution of that year he retired altogether into private life. His death took place at Paris on the 1st of March 1842.

His papers for the period 1793-1800 have been published (Paris, 1846).

VICTUAL, food, provisions, most commonly in the plural, "victuals." The word and its pronunciation came into English from the O. Fr. vitaille. The modern French and English spelling are due to a pedantic approximation to the Latin original, vicītāliu, a neuter plural substantive formed from vitālis, vitus, nourishment, provisions (hence, to live). The most familiar use of the term is in "licensed victuallers," to which the Licensing Act 1872 (§ 27) has applied the wide significance of any person selling any intoxicating liquor under a licence from a justice of the peace. Properly a "victualling house" is one where persons are provided with food and drink but not lodgings, and is thus distinct from an inn, which also provides the last.

VICUGNÁ, one of the two wild living South American representatives of the camel-tribe, a Camelidae (see Tylopoda). From its relative the vicuña, it is separated by the longer, more slender build and shorter head, as well as by the absence of bare patches of callousities on the hind limbs. The general colour of the woolly coat is orange-red. Vicugnas live in herds on the bleak and elevated parts of the mountain range bordering the region of perpetual snow, amidst rocks and precipices, occurring in various parts of Peru, in the southern part of Ecuador, and as far south as the middle of Bolivia. The wool is extremely delicate and soft, and highly valued for the purposes of weaving, but the quantity which each animal produces is not great.

VIDA, MARCO GIROLAMO (c. 1480-1566), Italian scholar and Latin poet, was born at Cremona shortly before the year 1490. He received the name of Marcantonio in baptism, but changed this to Marco Girolamo when he entered the order of the Canonici Regolari Lateranensi. During his early manhood he acquired considerable fame by the composition of two didactic poems in the Latin tongue, on the Game of Chess (Scacchiæ Ludus) and on the Silkworm (Bombyx). This reputation induced him to seek the papal court in Rome, which was rapidly becoming the headquarters of polite learning, the place where students might expect advancement through their literary talents. Vida reached Rome in the last years of the pontificate of Julius II. Leo X., on succeeding to the papal chair (1513), treated him with marked favour, bestowed on him the priory of St Sylvester at Frascati, and bade him compose a heroic Latin poem on the life of Christ. Such was the origin of the Christiadi, Vida's most celebrated, if not his best, performance. It did not, however, see the light in Leo's lifetime. Between the years 1520 and 1527 Vida produced the second of his masterpieces in Latin hexameters, or didactic poems on the Art of Poetry (see Baldi's edition, Würzburg, 1851). Clement VII. raised him to the rank of apostolic protonotary, and in 1532 conferred on him the bishopric of Alba. It is probable that he took up his residence in this town soon after the death of Clement; and here he spent the greater portion of his remaining years. Vida attended the council of Trent, where he enjoyed the society of Cardinals Cervini, Pole and Del Monte, together with his friend the poet Flaminio. A record of their conversations may be studied in Vida's Latin dialogue De Poëtu. Later, among his works, might be mentioned three eloquent orations in defence of Cremona against Pavia, composed upon the occasion of some dispute as to precedence between those two cities. Vida died at Alba on the 27th of September 1566. See the Life by Lancetti (Milan, 1840).
their private seigneuries. Thus the vidame de Ploëguyn was the representative of the bishop of Amiens, the vidame de Gerberoy of the bishop of Beauvais. In many sees there were no vidames, their function being exercised by viscounts or châteauxains. With the growth of the central power and of that of the municipalities the vidames gradually lost all importance, and the title became merely honorary.

See A. Luchaire, Manuel des institutions françaises (Paris, 1892); De la France des origines à l'année 1500, Mem. Ist. France, 8e année, (1900); M. Mallet, "Étude hist. sur les avoués et les vidames," in Position des thèses de l'Ecole des charles (an. 1870-72).

VIDIN (formerly written WIDIN or WIDDIN), a fortified river-port and the capital of a department in the extreme N.E. of Bulgaria; on the right bank of the river Danube, near the Servian frontier and 151 m. W.N.W. of Sofia. Pop. (1806) 16,168, including about 3000 Turks and 1500 Spanish Jews—descendants of the refugees who fled hither from the Inquisition in the 16th century. Vidin is an episcopal see and the headquarters of a brigade; it was formerly a strongly built town, and was rendered difficult to besiege by the surrounding marshes, formed where the Topolovita and other streams join the Danube. A steam ferry connects it with Calafat, on the Rumanian bank of the Danube, and there is a branch railway to Medzra, on the main line Sofia-Plevna. The city consists of three divisions—the modern suburbs extending beside the Danube, the citadel and the old town, still surrounded by walls, though only four of its nine towers remain standing. The old town, containing several mosques and synagogues and a bazaar, preserves its oriental appearance; the citadel is used as a military magazine. There are a modern cathedral, a school of viticulture and a high school, besides an ancient clock-tower and the palace (Konak) formerly occupied by the Turkish pašas. Vidin exports cereals and fruit, and is locally celebrated for its gold and silver filigree. It has important fisheries and manufactures of spirits, beer and tobacco.

Vidin stands on the site of the Roman town of Bononia in Moesia Superior, not to be confounded with the Pannonian Bononia, which stood higher up the Danube to the north of Sirmium. Its name figures prominently in the military annals of medieval and recent times; and it is specially memorable for the overthrow of the Turks by the imperial forces in 1689 and for the crushing defeat of the hospodar Michael Sustos by Pasvan Oglu in 1801. It was again the scene of stirring events during the Russo-Turkish Wars of 1854-55 and 1877-78, and successfully resisted the assaults of the Servians in the Servo-Bulgarian War of 1886-87.

VIDOCQ, FRANÇOIS EUGÈNE (1775-1857), French detective, was born at Arras in 1775 (or possibly 1773). After an adventurous youth he joined the French army, where he rose to be lieutenant. At Lille he was imprisoned as the result of a quarrel with a brother officer, and while in gaol became involved, possibly innocently, in the forgery of an order for the release of another prisoner. He was sentenced to eight years' hard labour, and sent to the galleys at Brest, whence he escaped twice but was recaptured. For the third time he succeeded in getting free, and lived for some time in the company of thieves and other criminals in Paris and elsewhere, making a careful study of their methods. He then offered his services as a spy to the Paris police (1809). The offer was accepted, on condition that he should extend his knowledge of the criminal classes by himself serving a further term in prison in Paris, and subsequently Vidocq was made chief of the reorganized detective department of the Paris police, with a body of ex-convicts under his immediate command. In this capacity Vidocq was extremely successful, for he possessed unbounded energy and a real genius for hunting down criminals. In 1827, having saved a considerable sum of money, he retired from his post and started a paper-mill, the workpeople in which were drawn entirely from ex-convicts. The venture, however, was a failure, and in 1832 Vidocq re-entered the police service and was employed mainly in political work, though given no special office.

Anxious to get back to his old detective post he himself foolishly organized a daring theft. The authorities were unable to trace the thieves, who at the proper moment were "discovered" by Vidocq. His real part in the matter became known, however, and he was dismissed from service. He subsequently started a private inquiry agency, which was indifferently successful, and was finally suppressed. Vidocq died in great poverty in 1857. Several volumes have been published under his name, "Vie de Vidocq," and "Memoires d'un inspecteur de police," but they were written by Vidocq (1858). It is, however, extremely doubtful whether he wrote any of them.

See Charles Ledru, La Vie, la mort et les derniers moments de Vidocq (Paris, 1857).

VIDYASAGAR, ISWAR CHANDRA (1820-1891), writer and social reformer of Bengal, was born at Bir sina in the Midnapur district in 1820, of a Kulin Brahman family. He was removed to Calcutta at the age of nine, was admitted into the Sanskrit College, and carried on his studies in the midst of privations and extreme poverty. In 1839 he obtained the title of Vidyasagar ("the learning one") after passing a brilliant examination, and in 1850 was appointed head-pendant of Fort William College. In 1846 appeared his first work in Bengali prose, The Twenty-Five Tales of a Betal. This was succeeded by his Sakuntala in 1855, and by his greatest work, The Exile of Sita, in 1862. These are marked by a grace and beauty which Bengal prose had never known before. The literature of Bengal, previous to the 19th century, was entirely in verse. Ram Mohan Roy, the religious reformer of Bengal, created the literary prose of Bengal early in the 19th century by his numerous translations and religious tracts; and Iswar Chandra Vidyasagar and his fellow-worker, Akhoy Kumar Datta, added to its power and beauty the middle of that century. These three writers are generally recognized as the fathers of Bengali prose literature. As a social reformer and educationist, too, Iswar Chandra made his mark. He associated himself with Drinkwater Bethune in the cause of female education; and the management of the girls' school, called after Bethune, was entrusted to him in 1851. And when Rosomoy Datta resigned the post of secretary to the Sanskrit College of Calcutta, a new post of principal was created, and Iswar Chandra was appointed to it. Iswar Chandra's influence in the education department was now unbounded. He simplified the method of learning Sanskrit, and thus spread a knowledge of that ancient tongue among his countrymen. He was consulted in all educational matters by Sir Frederick Halliday, the first lieutenant-governor of Bengal. And when the great scheme of education under Sir Charles Wood's despatch of 1854 was inaugurated in India, Iswar Chandra established numerous aided schools under that scheme in the most advanced districts of Bengal. In 1858 he resigned his appointment under government, and shortly afterwards became manager of the Metropolitan Institution, a private college at Calcutta. But a greater task than literary work or educational reforms claimed his attention. He had discovered that the ancient Hindu scriptures did not enjoin perpetual widowhood, and in 1855 he startled the Hindu world by his work on the Remarriage of Hindu Widows. Such a work, from a learned and presumably orthodox Brahman, caused the greatest excitement, but Iswar Chandra remained unmoved amidst a storm of indignation. Associating himself with the most influential men of the day, like Prosno Kumar Tagore and Ram Gopal Ghosh, he appealed to the British government to declare that the sons of remarried Hindu widows should be considered Hindus. The British government responded; the act was passed in 1856, and some years after Iswar Chandra's own son was married to a widow. In the last years of his life Iswar Chandra wrote works against Hindu polygamy. He was as well known for his charity and wide philanthropy as for his educational and social reforms. His large income, derived from the sale of school-books, was devoted almost entirely to the succour of the needy; hundreds of young men owed their education to him; hundreds of widows depended on him for their daily bread. The Indian government made him a Companion of the Indian Empire in 1880. He died on the 29th of July 1891. 

(R. C. D.)
VIEIRA, ANTONIO (1608-1697), Portuguese Jesuit and
writer, the "prince of Catholic pulpit-orphants of his time," was
born in Lisbon on the 6th of February 1608. Accompanying
his parents to Brazil in 1615 he received his education at the
Jesuit college at Bahia. He entered the Jesuit novitiate in
1625, and two years later pronounced his first vows. In
the next year he was teaching rhetoric and a little later
dogmatic theology, at the college of Olinda, besides writing
the "annual letters" of the province. In 1635 he received
the priesthood. He soon began to distinguish himself as an orator,
and the three patriotic sermons he delivered at Bahia (1638-40)
are remarkable for their imaginative power and dignity of
language. The sermon for the success of the arms of Portugal
against Holland was considered by the Abbé Raynal to be
"perhaps the most extraordinary discourse ever heard from a
Christian pulpit." When the revolution of 1640 placed
John IV. on the throne of Portugal, Brazil gave him its allegi-
ance, and Vieira was chosen to accompany the viceroy's son to
Lisbon to congratulate the new king. His talents and aptitude
for affairs impressed John IV. so favourably that he appointed
him royal preacher, gave him free access to the palace and
continuously consulted him on the business of the state. Pos-
sessed of great political sagacity and knowledge of the lessons
of history, Vieira used the pulpit as a tribune from which he
propounded measures for improving the general and particularly
the economic condition of Portugal. His pen was as busy as his
mouth. In 1651 he embarked his career as a diplomat, in the course of which he visited England, France,
Holland and Italy. In his Papel Furto he urged the cession of
Pernambuco to the Dutch as the price of peace, while his mission
to Rome in 1650 was undertaken in the hope of arranging
a marriage between the heir to the throne of Portugal and the
only daughter of King Philip IV. of Spain. His success, freedom
of speech and reforming zeal had made him enemies on all
sides, and only the intervention of the king prevented his
expulsion from the Company of Jesus, so that prudence coun-
selled his return to Brazil.
Vieira was a devoted friend of the Jesuit order, and he vowed to consecrate his life to the con-
version of the negro slaves and native Indians of his adopted
country, and arriving in Maranhão early in 1653 he recom-

cended his apostolic labours, which had been interrupted
during his stay of fourteen years in the Old World. Starting
from Pará, he penetrated to the banks of the Tocantins, making
numerous converts to Christianity and civilization among the
most savage tribes; but after two years of unceasing labour,
during which every difficulty was placed in his way by the
colonial authorities, he saw that the Indians must be with-
drawn, either by force or by persuasion. As long as they
remained at such distances as could not be visited by the
exploitation, and placed under the control of the members of a
single religious society. Accordingly in June 1654 he set sail
for Lisbon to plead the cause of the Indians, and in April 1655
he obtained from the king a series of decrees which placed
the missions under the Company of Jesus, with himself as their
superior, and prohibited the enslavement of the natives, except
in certain specified cases. Returning with this charter of
freedom, he organized the missions over a territory having a
coast-line of 400 leagues, and a population of 200,000 souls,
and in the next six years (1655-61) the indefatigable mis-
sionary set the crown on this work. After a time, however,
the colonists, attributing the shortage of slaves and the con-
sequent diminution in their profits to the Jesuits, began actively
to oppose Vieira, and they were joined by members of the
secular clergy and the other Orders who were jealous of the monopoly enjoyed by the Company in the government of the
Indians. Vieira was accused of want of patriotism and usurpa-
tion of jurisdiction, and in 1661, after a popular revolt, the
authorities sent him with thirty-one other Jesuit missionaries
back to Portugal. He found his friend King John IV. dead, and
the court a prey to faction, but, dauntless as ever in the pursuit
of his ambition, he resorted to his favourite arm of preaching,
and on Epiphany Day, 1662, in the royal chapel, he replied
to his persecutors in a famous rhetorical effort, and called for
the execution of the royal decrees in favour of the Indians.
Circumstances were against him, however, and, the count of
Castelmalhor, fearing his influence at court, had him exiled
first to Oporto and then to Coimbra; but in both these places
he continued his work of preaching, and the reform of the
Inquisition also occupied a large part of his literary enemies
then denounced him to that tribunal, and he was cited to appear before the Holy Office at Coimbra to answer
points smacking of heresy in his sermons, conversations and
writings. He had believed in the prophecies of a 16th-century
shoemaker poet, Bandarra, dealing with the coming of a ruler
who would inaugurate an epoch of unparalleled prosperity
for the church and for Portugal, and in the Quinto Imperio
or Clavis Prophetarum he had endeavoured to prove the truth
of his dreams from passages of Scripture. As he refused to
submit, the Inquisitors kept him in prison from October 1665
to February 1667, and finally imposed a sentence which pros-
hibited him from teaching, writing or preaching. It was
a heavy blow for the Company, and though Vieira recovered his
freedom and much of his prestige shortly afterwards on the
accession of King Pedro II., it was determined that he should
go to Rome to procure the revision of the sentence, which still
hung over him though the penalties had been removed. During
a six years' residence in the Eternal City Vieira won his greatest
triumphs. Pope Clement X. invited him to preach before the
College of Cardinals, and he became confessor to Queen
Catherine. He was appointed to the chair of theology in Rome
and the position of rector of the College of Jesus. At the request of the pope he drew up a report of two hundred
pages on the Inquisition in Portugal, with the result that
after a judicial inquiry Pope Innocent XI. suspended it for
five years (1667-81). Ultimately Vieira returned to Portugal with a papal bull exempting him from the jurisdiction of the
grand inquisitor, and in January 1681 he embarked for Brazil.
He resided in Bahia and occupied himself in revising his sermons
for publication, and in 1687 he became superior of the province.
A false accusation of complicity in an assassination, and the
intrigues of members of his own Company, clouded his last
months, and on the 18th of October 1687 he died.
His works form perhaps the greatest monument of Portuguese
prose. Two hundred discourses exist to prove his fecundity,
while his versatility is shown by the fact that he could treat
the same subject differently on half a dozen occasions. His
letters, simple and conversational in style, have a deep his-
torical and political interest, and form documents of the first
value for the history of the period. As a man, Vieira would
have made a nobler figure if he had not been so great an egotist
and so clever a courtier, and the readiness with which he sus-
pected and feared all his enemies, and the impatience of his
warmth argues a certain lack of sincerity. His name, how-
ever, is identified with great causes, justice to the Jews
and humanity to the Indians, and the fact that he was in advance
of his age led to many of his troubles, while his disinterested-
ness in money matters is deserving of all praise.

Principal works: Sermones (Sermons) (15 vols., Lisbon, 1679-
1742); there are many subsequent editions, but none complete;
translations exist in Spanish, Italian, German and French,
which have gone through several editions. Historia do Futuro
(Lisbon, 1718; 2nd ed., ibid., 1755); this and the Quinto Imperio
and the Clavis Prophetarum seem to be in essence one and the
same book in different redactions. Cartas (Letters) (3 vols., Lisbon,
1735-46). Noticias recolhidas do modo de proceder a Inquisição de
Portugal com os seus processos (Lisbon, 1821). A Arte de Predicar,
published under Vieira's name in many editions is now known not
to be his. A badly edited edition of the works of Vieira in 27 volumes appeared in Lisbon, 1854-58. There are unpublished MSS. of his in the British Museum in London, and in the Bibliothèque Nationale in Paris. A bibliography of Vieira will be found in Sommervogel, Bibliothèque de la compagnie de Jésus, viii. 653-89.

Dionisio.—André de Barros, Vida (Lisbon, 1746)—a panegyric by a member of the same society; D. Francisco Alexandre Lobo, bishop of Vizeu, “Historical and Critical Discourse,” Obras (Lisbon, 1849), vol. ii.—a valuable study; João Francisco Lisboa, Vida de Sotero de Jesus (1770), the last in the series;—he is sent to Vizeu, but manages to escape and to check the next writer, Abbé E. Carel, Vieira, sua vida e seus œuvres (Paris, 1879); Luiz Cabral, Vieira, biog., caráctere, elo-quence (Paris, 1900); Idem, Vieira pregador (2 vols., Oporto, 1901); Sotero dos Reis, Curso de literatura Portuguesa e Espanhola, iii. 121-244. (E.P.)

VIÉLÉ-GRIFLIN, FRANCIS (1864— ), French poet, was born at Norfolk, Virginia, U.S.A., on the 26th of May 1864. He was educated in France, dividing his time between Paris and Tournai. His volumes include Cuadelle d’avit (1885); Les Cygnes (1887; new series, 1892); La Chevauchée d’Yeldis (1893); Swinhilde, a dramatic poem (1894); Louis Veneris (1899), a volume of vielleurs in France, an oval, which with its modifications remained in favour until the guitar-fiddle, the Italian lyra, asserted itself as the finest type, from which also the violin was directly evolved. (K.S.)

VIEN, JOSEPH MARIE (1716-1800), French painter, was born at Montpellier on the 18th of June 1716. Protected by Comte de Caylus, he entered at an early age the studio of Natoire, and obtained the grand prix in 1745. He used his time at Rome in applying to the study of nature and the development of his own powers all that he gleaned from the masterpieces around him; but his tendencies were so foreign to the reigning taste that on his return to Paris he owed his admission to the academy for his picture “Daedalus and Icarus” (Louve) solely to the indignant protests of Boucher. When in 1776, at the height of his established reputation, he became director of the school of France at Rome, he took David with him amongst his pupils. After his return, five years later, his fortunes were wrecked by the Revolution; but he undauntedly set to work, and at the age of eighty (1796) carried off the prize in an open government competition. Bonaparte acknowledged his merit by making him a senator. He died at Paris on the 27th of March 1809, leaving behind him several brilliant pupils, amongst whom were Vincent, Regnault, Suve, Ménageot, Taillasson and others of high merit; nor should the name of his wife, Marie Thérèse Reboul (1728-1805), herself a member of the academy, be omitted from this list. Their son, Marie Joseph, born in 1761, also distinguished himself as a painter.

VIENNA (Ger. Wien; Lat. Vindobona), the capital of the Austrian empire, the largest city in the Austro-Hungarian monarchy, and the fourth city in Europe as regards population. It is situated on the right bank of the Danube, at the base of the Wiener Wald, and at the beginning of the great plain which separates the Alps from the Carpathians. This plain is continued on the opposite bank of the Danube by the valley of the March, which constitutes the easiest access to the north. Thus Vienna forms a junction of natural ways from south to north, and from west to east. It also lies on the frontier which separates from one another three races, the German, the Slavonic and the Hungarian.

Curiously enough, Vienna has for a long time turned its back, so to speak, on the magnificent waterway of the Danube, the creation being built about 14 m. away from the main stream. Only an arm of the river, the Danube Canal, so called because it was regulated and widened in 1598, passes through the city, dividing it into two unequal parts. It is true that the river forms at this point several arms, and the adjoining districts were subjected to periodical inundations, while navigation was by no means easy here. But in 1870 works for the regulation of the river were started with the object of making it quite safe for navigation, and of avoiding the dangers of inundation. By these magnificent works of regulation the river was brought nearer to the town, and the new river channel has an average width of 15 m. and a depth of about 1 m.

On its left bank stretches the so-called inundation region, 1535 ft. wide, while on the right bank quays have been constructed with numerous wharfs and warehouses. By these works of regulation over 2400 acres of ground were gained for building purposes. This new bed of the Danube was completed in 1876. In conjunction with this work the entire Danube Canal has been transformed into a harbour by the construction of a lock at its entrance, while increased accommodation for shipping has also been provided at the other end of the canal known as the winter harbour. Into the Danube Canal flows the small stream, called Wien, now arched over almost in its entirety. Vienna extends along the right bank of the Danube from the historic and legendary Kahlenberg to the point where the Danube Canal rejoins the main stream, being surrounded on the other side by a considerable stretch of land which is rather rural than suburban in character.

Vienna is officially divided into twenty-one districts or Bezirke. Until 1892 it contained only ten of the present districts; in that year nine outlying districts were incorporated with the town; in 1900 Birkittau was created out of part of the old district of Leopoldstadt, and in 1905 the Floridsdorf district was made up by the incorporation of the following former suburbs: Aspern-der-Donauf, Donaufeld, Floridsdorf, Gross Jedlersdorf, Hirschstetten, Jedlesee, Kragan, Leopoldau, Lobau-Insel and Stadlau. By the incorporation of the suburbs in 1892, the area of Vienna was more than trebled, namely, from 214 sq. m. to 69 sq. m.; while a new increase of about one-fifth of its total area was added by the incorporation of 1902. A feature of the new city is the unusually large proportion of woods and arable land within its bounds. These form nearly 60% of its total area, private gardens, parks and open spaces occupying a further 15%. While from the standpoint of population it takes the fourth place among European capitals, Vienna covers about three times as much ground as Berlin, which occupies the third place. But the bulk of its inhabitants being packed into a comparatively small portion of this area, the working classes suffer greatly from overcrowding, and all sections of the community from high rents.

The inner city, or Vienna proper, was formerly separated from the other districts by a circle of fortifications, consisting of a rampart, fossé and glacis. These, however, were removed in 1858-60, and the place of the glacis has been taken by a magnificent boulevard, the Ring-Strasse, 2 m. in length, and about 150 ft. in average width. Another series of works, consisting of a rampart and fossé, were constructed in 1704 to surround the whole city at that time, i.e. the first ten districts of modern Vienna. This second girdle of fortifications was known as the Lines (Linien), and a second wide boulevard (Gürtel-Strasse) follows their course round the city. This second or outer girdle of fortifications formed the boundary
between the city and the outlying suburbs, but was removed in 1892, when the incorporation of the suburbs took place.

The inner town, which lies almost exactly in the centre of the others, is still, unlike the older parts of most European towns, the most aristocratic quarter, containing the palaces of the emperors and of the nobility. The government houses, many of the embassies and legations, the opera house and the principal hotels, Leopoldstadt which together with Brigitenau are the only districts on the left bank of the Danube Canal, is the chief commercial quarter, and is inhabited to a great extent by Jews. Marienhilf, Neubau and Margarethen are the chief seats of manufacturing industry. Landstrasse may be described as the district of officialism; here too are the British and German embassies. Alsergrund, with the enormous general hospital, the military hospital and the municipal asylum, is the medical quarter.

Near the centre of the inner city, most of the streets in which are narrow and irregular, is the cathedral of St Stephen, the most important medieval building in Vienna, dating in its present form mainly from the 14th and 15th centuries, but incorporating a few fragments of the original 12th-century edifice. Among its most striking features are the fine and lofty tower (450 ft.), rebuilt in 1860-64; the extensive catacombs, in which the emperors were formerly interred; the sarcophagus (1513) of Frederick III.; the tombs of Prince Eugene of Savoy; thirty-eight marble altars; and the gigantic ceiling. A little to the south of the cathedral is the Hofburg, the imperial palace, a huge complex of buildings of various epochs and in various styles, enclosing several courtyards. The oldest part of the present edifice dates from the 13th century, and extensive additions have been made since 1887. In addition to private rooms and state apartments, the Hofburg contains a library of about 800,000 volumes, 7000 incunabula and 24,000 MSS., including the celebrated "Papyrus Rainer"; the imperial treasury, containing the family treasures of the house of Habsburg-Lorraine, and other important collections.

In the old town are the two largest of the Hofte, extensive blocks of buildings belonging to the great abbeys of Austria, which are common throughout Vienna. These are the Schottenhof (once belonging to the "Scoti," or Irish Benedictines) and the Mollerhof, adjoining the open space called the Freiung, each forming a little town of itself. As in most continental towns, the custom of living in flats is prevalent in Vienna, where few except the richer nobles occupy an entire house. Of late the so-called "Zinspaläste" ("tenement palaces") have been built on a magnificent scale, often profusely adorned without regard to artistic or sculptural effect. Other notable buildings within the line of the old fortifications are the Gothic Augustine church, built in the 14th century, and containing a fine monument of Canova; the Capuchin church, with the burial vault of the Habsburgs; the church of Maria-Stiegen, an interesting Gothic church of the 14th century, restored in 1820; the handsome Greek church, by T. Hansen (1813-1891), finished in 1828; the Minorite church, a Gothic edifice of the 14th century, containing an admirable mosaic of Leonardo da Vinci's "Last Supper" by Raffael, executed in 1806-14 by order of Napoleon and placed here in 1846. Other churches worth mentioning are the Snabchurch, one of the busiest of the city, reconstructed in the 17th and restored by H. von Ferstel (1828-1853), containing the tombs of the counts of Starhemberg, the defender of Vienna against the Turks in 1683, and of Duke Heinrich Jasomirgott (d. 1777); the church of St Peter, reconstructed by Fischer von Erlach in 1702-13, and the University church, erected by the Jesuits in 1625-31, both in the baroque style with rich frescoes; lastly, the small church of St Ruprecht, the oldest church in Vienna, first built in 740, and several times reconstructed; and the old Rathaus. At the corner of the Graben and the bar of the cathedral, thoroughfares, containing the most fashionable shops in Vienna, is the Stock im Eisen, the stump of a tree, said to be the last survivor of a holy grove round which the original settlement of Vindomina sprang up. It is full of nails driven into it by travelling journeymen.

The Ring-Strasse ranks as one of the most imposing achievements of modern street architecture. Opposite the Hofburg, the main body of which is separated from the Ring-Strasse by the Hofgarten and Volksgarten, rise the handsome monument of the empress Maria Theresa (erected 1807) and the imperial museums of art and natural history, two extensive Renaissance edifices. Near the Ring (erected 1787-89), matching each other in every particular and grouping finely with the new part of the palace. Hans Makart's painted dome in the natural history museum is the largest pictorial canvas in the world. Adjoining the museums to the west is the palace of justice (1881), and this is closely followed by the houses of parliament (1883), in which the Grecian style has been successfully adapted to modern requirements. Beyond the houses of parliament stands the new Rathaus, an immense and exquisitely decorated Gothic building, erected in 1873-83. It was designed by Friedrich Schmidt (1825-1891), who may be described as the chief exponent of the modern Gothic tendency as T. Hansen and G. Semper, the creators respectively of the parliament house and the museums, are the leaders of the Classical and Renaissance styles which are so strongly represented in Viennese architecture. Opposite the Rathaus, on the inner side of the Ring, is the new court theatre, another specimen of Semper's Renaissance work, finished in 1889. To the north stands the new building of the Academy of Fine Arts and of Architecture erected by H. von Ferstel, erected in 1873-84 and rivalling the Rathaus in magnificence, and separated from the Ring by a garden, stands the votive church in Alsergrund, completed in 1879, and erected to commemorate the emperor's escape from assassination in 1853, one of the most elaborate and successful of modern Gothic churches (Ferstel). The other important buildings of the Ring-Strasse include the magnificent opera house, built 1861-69, by E. Van der Nul (1812-1868) and A. von Sicardsburg (1861-1860), the sumptuous interior of which is modelled on that of Paris; the academy of art, built in 1872-74; the Alte Hofburg (1812-1868) a reconstruction of the first imperial palace, the Austrian museum of art and industry, an Italian Renaissance building erected by Ferstel in 1868-71. On the north side the Ring-Strasse gives place to the spacious Franz Josef's quay, flanking the Danube Canal. The municipal districts outside the Ring also contain numerous handsome modern buildings. Vienna possesses both in the inner city and the outlying districts numerous squares adorned with artistic monuments. One of the finest squares in the world for the beauty of the buildings which encircle it is the Rathausplatz, adjoining the Ring-Strasse.

Vienna is the intellectual as well as the material capital of Austria—eminently so in regard to the German part of the empire. Its university, established in 1365, is now attended by nearly 6000 students, and the medical faculty enjoys a world-wide reputation. Its scientific institutions are headed by the academy of science. The academy of art was founded in 1707.

Museums.—In the imperial art-history museum are stored the extensive art-collections of the Austrian imperial family, which were formerly in the Hofburg, in the Belvedere, and in other places. It contains a rich collection of Austrian, German, and Italian Roman and Etruscan antiquities; of coins and medals, and of industrial art. The last contains valuable specimens of the industrial art of the middle ages and of the Renaissance period in gold, silver, bronze, glass, enamel, ivory, and wood. The famous salt-cellar (soleria) of Benvenuto Cellini, executed in 1539-43 for Francis I. of France, is here. Then comes the collection of weapons and armour, including the famous Ambra collection, so called after the castle of Ambra near Innsbruck, where it was for a long time stored. The picture gallery, which contains the collection formerly preserved in the Belvedere, contains also collections of almost every school in the world, but it is unsurpassed for its specimens of Rubens, Dürer and the Venetian masters. Next come the imperial treasury at the Hofburg, already mentioned; the famous collection of drawings and engravings known as the Kupferstichkabinett, which contains over 200,000 engravings and 16,000 drawings; the picture gallery of the academy of art; the collection of the Austrian museum of art and industry: the historical museum of the city of Vienna; and the military museum at the arsenal.
Besides, there are in Vienna a number of private picture galleries of great importance. The largest is that belonging to Prince Lichtenstein, containing about 2000 paintings, and another, still larger, in important works by Rubens and Van Dyck; the picture gallery of Count Harrach, with over 400 paintings, possessing numerous examples of the later Italian and French schools; that of Count Czernin, a collection of 7000 paintings; and that of Count von Sturmer, containing 110 pictures. The imperial natural history museum contains a mineralogical, geological and zoological section, as well as a pre-historic and ethnographical collection.

Government and Administration.—Vienna is the residence of the emperor of Austria, the seat of the Austrian ministers, of the Reichsrat and of the Diet of Lower Austria. It is also the seat of the common ministries for the Austro-Hungarian monarchy, of the foreign ambassadors and general consuls and the commercial representatives. By the constitution of 1867, 227 Eugenists, of whom 144 are naturalized Hungarians, have the right to vote for representatives of the chamber of deputies. The municipal council of the city and the county council are elected by universal and equal suffrage. The constitution of the government is a free and popular constitution, with an emperor and a representative legislature which is elected for six years. The government by theRecently popularized in Vienna has been the action of a bill of exchange for certain transactions, and the provision of separate institutions, churches, schools (thus far private) and places of rest. The consequence is that they take a pride in the sense of the great qualities of their native city, and that a demand, which threatens to develop into a new source of discord, in 1900 the population included 1,386,115 persons of German nationality, 21,733 Serbo-Croats, 3,329 Slovences, 3,631 Serbs and Montenegrins, 1,298 Germans, 3,322 Czechs, 271 Serbo-Croatians, 1,329 Slovences, 271 Serbo-Croats, and 1,368 Italians, all Austrian subjects. To these should be added 133,144 Hungarians, 21,733 natives of Germany (37,000 less than in 1890), 2,006 natives of Italy, 1,323 natives of Bohemia (36,364), 1,323 natives of Switzerland (184), described as the German capital of a Slav empire. Formerly the Czech labourers, artisans and domestic servants who came to Vienna were somewhat ashamed of their mother-tongue and religion, and not evidence of their origin as speedily as possible. The revival of the nationality agitation has produced a marked change in this respect. The Czech immigrants, attracted to Vienna as to other German towns by the growth of industry, are now too numerous for easy absorption, which is further retarded by their national organization, and the provision of separate institutions, churches, schools (thus far private) and places of rest. The consequence is that they take a pride in the sense of the great qualities of their native city, and that a demand, which threatens to develop into a new source of discord,

The Austro-Hungarian government has had a large extent covered its own expenses through the acquisition by the town of the old port of Augarten, and 1,100 acres of land, and the expense of putting up a line of houses and trees, and of the extra burdens assumed on the incorporation of the suburbs, the equilibrium of the communal budget was maintained up to the fall of the Liberal administration. In spite of shortighted parsimony in the matter of schools, &c., and increased resources through the allocation to the municipality of a certain percentage of new state and provincial taxation, their anti-Semitic successors have been unable to avoid a deficit, and have been obliged to increase the rates. But the direct damage done in this and other ways would seem to be less than that produced by the mistrust they inspired for a time among the property owners, who considered the community's course of action as an anti-Magyar attitude has driven away a certain amount of Hungarian custom, and helped to increase the political difficulties of the cisleithanian government.

Vienna is situated at an altitude of 550 ft. above the level of the sea, and possesses a healthy climate. The mean annual temperature is 48.6°F., and the range between January and July is about 40°F. The climate is rather changeable, and rapid falls of temperature are not uncommon. Violent storms occur in spring and autumn, and the rainfall, including snow, amounts to 35 in. The air is very sharp in the winter months, and drinking water of any European capital. The water is furnished by an aqueduct direct from the Alps, viz. from the Schnenberg, a distance of nearly 60 m. to the south-west. These magnificent waterworks were opened in 1873, and their sanitary
metropolis which its geographical position entitles it to be. But during the last quarter of the 19th century active steps were taken to modernise the capital. The most important advantage of the Danube, mentioned above, the conversion of the entire Danube Canal into a harbour, the construction of the navigable canal Danube-March-Oder—all gave a new impetus to the trade of Vienna. The last remaining activity of the port of Triest, and the new and shorter railway line constructed between it and Vienna also contribute to the same effect. Vienna carries on an extensive trade in corn, flour, wine, hemp, and a large amount of raw cotton and manufactured articles. Besides the Danube it is served by an extensive net of railways, which radiate from here to every part of the empire.

The staple productions are machinery, railway engines and carriages, steel and bronze wares, pottery, beer and wine, furniture, textiles and chemicals. In the number and variety of its leather and other fancy goods Vienna rivals Paris, and is also renowned for its manufacture of jewelry and articles of precious metals. Its pivots and iron goods, its chemical goods, its optical instruments, and artistic goods generally. Its articles of clothing, silk goods and millinery also enjoy a great reputation for the taste with which they are manufactured. Books, artistic publications, paper and beer are amongst the other principal goods. The building trade and its allied trades are also extensive.

History.—For several centuries Vienna filled an important rôle as the most advanced bulwark of Western civilization and Christianity against the Turks, for during the whole of the middle ages Hungary practically retained its Asiatic character. The story of Vienna begins in the earliest years of the Christian era, with the seizure of the Celtic settlement of Vinodomina by the Romans, who changed its name to Vindobona, and established a fortified camp here to command the Danube and protect the northern frontier of the empire. The fortress grew in importance, and was afterwards the seat of a bishopric. The Emperor Marcus Aurelius died in 180. On the decline of the Roman empire Vindobona became the prey of successive barbarian invaders. Attila and his Huns were among the temporary occupants of the place (5th century), and in the following century it came into the possession of the Avars, after which its name disappears from history until towards the close of the 8th century, when Charlemagne expelled the Avars and made the district between the Enns and the Wiener Wald the boundary of his empire. In the time of Otho II. (976) this “East Mark” (Ostmark, Oesterreich, Austria) was granted in feoff to the Babenbergers, and in the reign of Frederick Barbarossa (1156) it was advanced to the rank of a duchy. There is no certain record that the site of Vindobona was occupied at the time of the formation of the Ostmark, though many considerations make it probable. It is not likely that the Avars, living in their “ring” encampments, destroyed the Roman municiplum; and Becs, the Hungarian name for Vienna to this day, is susceptible of a Slavonic interpretation only, and would seem to indicate that the site had been occupied in Slavonic times. The first mention of Vienna is in the “Nibelungenlied” in the oldest extant version of the Nibelungenlied points in the same direction. Passion over a doubtful mention of “Wvesi” in the annals of 1030, we find the “civitas” of Vienna mentioned in a document of 1130, and in 1156 it became the capital and residence of Duke Heinrich Jasoningott. In 1237 Vienna received a charter of freedom from Frederick II., confirmed in 1247. In the time of the crusades Vienna increased so rapidly, in consequence of the traffic that flowed through it, that in the days of Ottacar II. of Bohemia (1231-70), the successor of the Babenbergers, it had assumed the dimensions of the present inner town. A new era of power and splendour began when it became the capital of the Habsburg dynasty, after the defeat of Ottacar by Rudolph of Habsburg. From this time on it has shared the fortunes of the house of Austria. In 1427 Vienna was besieged unsuccessfully by the Hungarians, and in 1458 it was taken by Matthew Corvinus. Of more importance were the two sieges by the Turks (1529 and 1683), when the city was saved on the first occasion by the gallant defence of Count Niclas von Salm (1459-1530), and on the second by Rüdiger von Staremburg (1638-1701), who held out until the fall of the Poles and Germans under John Sobieski of Poland. The suburbs, however, were destroyed on both occasions. In 1805, and again in 1809, Vienna was for a short time occupied by the French. In 1814-15 it was the meeting-place of the congress which settled the political affairs of Europe after the overthrow of Napoleon. In 1848 the city was for a time in the hands of the revolutionary party; but it was bombarded by the imperial forces and compelled to surrender on 30th October of the same year. Vienna was not occupied by the Prussians in the war of 1866, but the invaders marched to within sight of its towers. In 1873 a great international exhibition was held here.

While Berlin and Budapest have made the most rapid progress of all European cities, having multiplied their population by nine in the period 1800-90, Vienna— even including the extensive annexations of 1802—only increased sevenfold. Many causes conspired to this end, but most of them date from the years 1859, 1866 and 1873. The combined effect of these successive blows, aggravated by the long period of decentralizing policy from Taffe to Badeni, is still felt in the Kaisersstadt. The gaiety of Vienna had for centuries depended on the brilliancy of its court, recruited from all parts of Europe, including the nobility of the whole empire, and on its musical, light-hearted and contented population. Even before it fell from its high estate as the social centre of the German-speaking world, it had suffered severely by the crushing defeats of 1879 and the consequent exodus of the Austrian nobles. These were held responsible for the misfortunes of the army, and to escape the atmosphere of popular odium retired to their country seats and the provincial capitals. They have never since made Vienna their home to the same extent as before. The change thus begun was confirmed by the exclusion of Austria from the German Confederation in 1866 and the subsequent activities of her Constitution. However, which gave an immense impetus to the two rival capitals.

Thus within eight years the range of territory from which Vienna drew its former throngs of wealthy pleasure-seeking visitors and more or less permanent inhabitants—Italian, German and Hungarian—was enormously restricted. Since then Vienna has benefited largely by the enlightened efforts of its citizens and the exceptional opportunities afforded by the removal of the fortifications. But a decline of its importance, similar to that within the larger sphere which it influenced prior to 1870, has continued uninterruptedly within the Habsburg dominions up to the present day. Its commercial classes constantly complain of the increasing competition of the provinces, and of the progressive industrial emancipation of Hungary. The efforts of the Hungarians to complete their social and economic, no less than their political, emancipation from Austria and Vienna have been unremittingly pursued. The formal recognition of Budapest as a royal residence and capital in 1852, and the appointment of independent Hungarian court functionaries in November 1853, mark new stages in its progress. It would no longer be correct to speak of Vienna as the capital of the dual monarchy. It merely shares that distinction with Budapest.

VIENNA, CONGRESS OF (1814-1815). The fall of Napoleon was only achieved by the creation of a special alliance between Great Britain, Austria, Russia and Prussia. By the Treaty of Chaumont of March 10, 1814, these four powers bound themselves together in a bond which was not to be dissolved when peace was concluded. When Napoleon had been beaten, France conceded to these allies by a secret article of the first Treaty of Paris of May 30, 1814, the disposition of all countries which Napoleon’s fall had freed from French suzerainty. This stupendous task was reserved for a general congress, and it was agreed to meet at Vienna. The visit of the allied sovereigns to England and the pressing engagements of the emperor Alexander and Lord Castlereagh delayed the congress until the
autumn, when all Europe sent its representatives to accept the hospitality of the impoverished but magnificent Austrian court.

Metternich, though he had not yet completely established his position, acted as chief Austrian representative, and he was naturally in his capacity as host the president of the congress. Friedrich v. Gentz acted as secretary both to him and the congress and did much of the routine work. Alexander of Russia directed his own diplomacy, and round him he had gathered a brilliant body of counsellors, but not control their master's desires. Of these the chief were foreigners, according to the traditions of Russian diplomacy. Capo d'Istria, Nesselrode, Stein, Pozzo di Borgo were perhaps the best men in Europe to manage the Russian policy, while Castoriski represented at the imperial court the hope of Polish nationality. Frederick William III. of Prussia was a weaker character and, as will be seen, his policy was largely determined by his ally, Prince von Hardenberg, who by no means shared all the views of his master but was incapacitated by his growing infirmities, yet first Prussian plenipotentiary, and ally of the great Baron von Humboldt. Great Britain was represented by Lord Castlereagh, and under him were the British diplomats who had been attached to the foreign armies since 1815, Clancarty, Stewart and Cathcart. Castlereagh brought with him decided views, which however were not altogether those of his cabinet, and his position was weakened by the fact that Great Britain was still at war with the United States, and that public opinion at home cared for little but the abolition of the slave trade. When parliamentary duties called Castlereagh home in February 1815, the duke of Wellington filled his place with adequate dignity and statesmanship until the war broke out.

France sent Prince Talleyrand to conduct her difficult affairs. No other man was so well fitted for the task of maintaining the interests of a defeated country. His rare diplomatic skill and supreme intellectual endowments were to enable him to play a deciding part in the coming congress. All the minor powers of Europe were represented, for all felt that their interests were at stake in the coming settlement. Gathered there also were a host of publicists, secretaries and courtiers, and never before had Europe witnessed such a collection of rank and talent. From the first the soundness of the congress impressed observers with its wealth and variety, nor did the statesmen disdain to use the dining-table or the ballroom as the instruments of their diplomacy.

All Europe awaited with eager expectation the results of so great an assembly. The fate of Poland and Saxony hung in the balance; Germany awaited an entirely new reorganization; Italy was again ready for dismemberment; rumours went that even the pope and the sultan might be largely affected. Some there were who hoped that so great an opportunity would not be lost, but that the statesmen would initiate such measures of international disarmament as would perpetuate the blessings of that peace which Europe was again enjoying after twenty years of warfare.

It was not long, however, before the allies displayed their intention of keeping the management of affairs entirely in their own hands. At an informal meeting on the 22nd of September the four great powers agreed that all subjects of general interest were to be settled by a committee consisting of Austria, Russia, Prussia and Great Britain together with France and Spain. At the same time, however, it was decided by a secret protocol that the four powers should first settle among themselves the distribution of the conquered territories, and that France and Spain should only be consulted when their final decision was announced.

This was the situation which Talleyrand had to face when he arrived on the 24th of September. His first step when he was admitted to the European committee, which was in the plans of the allies to act so colourless a part, was to ignore the position of the Four and to assert that only the congress as a whole could give the committee full powers. He would have meant an almost indefinite delay, for how was it possible to decide the exact rights of all the different states to a voice in affairs? After some heated discussion a compromise was arrived at. The opening of the congress was postponed, and Sweden and Portugal were added to the European committee, but the Four still persisted in the informal meetings which were to decide the important questions. Meanwhile separate committees were formed for the discussion of special problems. Thus a special committee was appointed consisting of the five German powers to discuss the constitution which was to replace the Holy Roman Empire, and another, the Czar and others for other minor questions. Talleyrand had, however, already shaken the position of the allies. He had posed as the defender of the public rights of Europe and won to his side the smaller powers and much of the public opinion of Europe, while the allies were beginning to be regarded more in the light of rapacious conquerors than as disinterested defenders of the liberties of Europe.

Had the Four remained united in their views they would still have been irresistible. But they were gradually dividing into two parties upon the Saxo-Polish question. Alexander, exaggerating the part he had played in the final struggle, and with some vague idea of nationality in his brain, demanded that the whole of Poland should be added to the Russian dominions. Austria was to be compensated in Italy, while Prussia was to receive the whole of Saxony, whose unfortunate monarch had been the most faithful of Napoleon's vassals.

It was Castlereagh that led the opposition to these almost peremptory demands of Alexander. A true disciple of Pitt, he came to the congress with an overwhelming distrust of the growing power of Russia, which was only second to his hatred of revolutionary France. He considered that the equilibrium of Europe would be irretrievably upset were the Russian boundaries to be pushed into the heart of Germany. Thus while willing, even anxious that Prussia should receive Saxony, in order that she might be strong to meet the danger from the East, he was prepared to go to any lengths to resist the claims of Russia. For Austria Saxony was really of more vital interest than Poland, but Castlereagh, despite a vigorous resistance from a section of the Austrian court, was able to win Metternich over to his views. He hoped to gain Prussia also to his side, but in the end the British, who from the position he had so uncompromisingly laid down. With the Prussian statesmen he had some success, but he could make no impression on Frederick William. Alexander used to the utmost that influence over the mind of the Prussian monarch which he had been preparing since the beginning of 1815. Against Castlereagh he entered the lists personally, and memorandum after memorandum was exchanged. Despite the warning letters of the British cabinet which, dismayed at the long continuance of the American War, counselled caution on a question in which England had no immediate interest, Castlereagh yielded no inch of his ground. But Metternich wavered on the question of Saxony, and December saw the allies hopelessly at difference. It seemed by no means unlikely that the armies which had conquered Napoleon would soon be engaged in conflict with one another.

It was Talleyrand's opportunity. As Castlereagh and Metternich began to regard the position as hopeless they began to look upon him as a possible ally. Talleyrand had constantly defended the rights of France's old ally Saxony in the name of the principle which his master Louis XVIII. represented. His passionate appeal on behalf of "legitimacy" was particularly adapted to the necessities of the situation. Alexander was driven into transports of rage by this championship of the ancien régime by one who had been a servant of its bitterest foe. But Castlereagh saw that war could only be avoided if one party was made stronger than the other. The reluctant consent of the British cabinet was obtained and Talleyrand was approached as an equal. He came boldly to the front in the middle of December as the champion of Saxony, and as Russia was still obstinate, Metternich and Castlereagh demanded the admission of France to the secret council. This was refused, and on the 3rd of January
VIENNE

1815 a secret treaty of defensive alliance was signed between France, Austria and Great Britain. For some time affairs hung in the balance, but Alexander could not mistake the tone of his opponents. Gradually a compromise was arranged, and by the end of the month all danger was past. Eventually Austria and Prussia retained most of their Polish dominions, and the latter power only received about two-fifths of Saxony. The rest of Poland was incorporated as a separate kingdom in the Russian dominions with a promise of a constitution of its own. Talleyrand had rescued France from its humiliating position, as equal as the side of the allies. Henceforward he made no effort for the rights of the whole congress.

Meanwhile other affairs had been progressing more harmoniously under the direction of special committees, which included representatives of the powers specially interested. Switzerland was given a constitution which led it in the direction of its later federalism. In Italy Austria retained her hold on Lombardy and Venetia, Genoa was assigned to the kingdom of Sardinia, while Parma went to Marie Louise, the legitimate heir, Carlo Ludovico, having to be content with the reversion after her death, the congress meanwhile assigning Lucca to her; the claims of the young Napoleon to succeed his mother in Parma were only destroyed by the efforts of France and England. The other petty monarchs were restored, and Murat's rash attempt, after Napoleon's return from Elba, to make himself king of united Italy, gave back Naples to the Bourbons, an event which would have been brought about in any case in the course of the next few years (see MURAT, JOACHIM). Holland was confirmed in the possession of Belgium and Luxemburg, Limburg and Liège were added to her dominions. Sweden, who had sacrificed Finland to Russia, obtained Norway.

German affairs, however, proved too complicated for complete solution. It was difficult enough to decide the claims of the states in the struggle for territory. Eventually, however, by methods of compromise, this was adjusted fairly satisfactorily. The greater states gained largely, especially Prussia, who was given large acquisitions of territory on the Rhine, partly as a compensation for her disappointment in the matter of Saxony, partly that she might act as a bulwark against France. Some disputes between Baden and Bavaria remained unsettled, and many questions arising out of the national confederations in Germany, which had been hurriedly patched together under the influence of the news of Napoleon's return, had to be postponed for further discussion, and were not settled until the Final Act agreed upon by the conference of German statesmen at Vienna in 1821.

Other more general objects, such as the free navigation of international rivers and the regulation of the rights of precedence among diplomatists (see DIPLOMACY), were managed with much address. Castlereagh's great efforts were rewarded by a declaration that the slave trade was to be abolished, though each power was left free to fix such a date as was most convenient to itself. The Final Act, embodying all the separate treaties, was signed on the 9th of June 1815, a few days before the battle of Waterloo.

Before the work of the congress was completed Napoleon was again at Paris, and the closing stages were hurried and ill-considered. One negotiation of supreme importance was cut short for this reason. Castlereagh had left Vienna with the hope that the powers would solemnly guarantee their territorial settlement and promise to make collective war on whoever dared to disturb it. This guarantee was to include the Ottoman dominions, in whose interests, indeed, it had been brought forward. Alexander made no objection provided that the Porte would submit all outstanding claims to arbitration. The distance of Constantinople from Vienna and the obstinacy of the sultan would probably have prevented a settlement, but the return of Napoleon rendered all such proposals almost absurd, and the scheme was dropped.

Thus the congress of Vienna failed to institute any new system for securing the stability of the European polity. nor did it recognize those new forces of liberty and nationality which had really caused Napoleon's downfall. Following the tradition of all preceding congresses, it was mainly a scramble for territory and power. Territories were distributed among the powers with no consideration for the feelings of their inhabitants, and in general the right of the strongest prevailed. For this reason it has often met with a condemnation that has perhaps been unmerited. It is true that the map of Europe shows to-day but little trace of its influence; but much of its work was determined by conditions over which statesmen had little control. Europe was not ready for the recognition of nationality and liberalism. What it wanted most of all was peace, and by establishing something like a territorial equilibrium the congress did much to win that breathing space which was the cardinal need of all.

BIBLIOGRAPHY.—The treaties and acts of the congress may be consulted in J. L. Klüber, Actes des Wien Congresses (9 vols.); Comte d'Angersberg, Le Congrès de Vienne (4 vols.); British and Foreign State Papers, vol. ii., gives some of the documents in English, and the Final Act is found in many collections. For the diplomacy, Wellington's Supplementary Despatches, vol. ix. and x.; Castlereagh's Letters and Despatches, vol.x.; Talleyrand's Mémoires, vols. ii. and iii., the works of Gontz (see GONTZ, F. VON) and the Mémoirs of Hardenberg and Cartorovsky are very useful. Other records have been collected in Memoires sur la Conférence de la Paix de Vienne (9 vols.); V. R. Siger, n'y sont spécialement consacrées. L'Empereur des Français. (1 vol.) and J. J. Custot, Contributions à l'Histoire de la Conférence de Vienne (3 vols.).

VIENNE, a river of central France, a left-hand tributary of the Loire, watering the departments of Corrèze, Haute-Vienne, Charente, Vienne and Indre-et-Loire. Length, 210 m.; area of basin, 8266 sq. m. Rising on the plateau of Millevaches 14 m. N.W. of Ussel (department of Corrèze) at a height of 2780 ft., the Vienne flows westward, between the highlands of Limousin on the south and the plateaux of Champagne, Franche-Comté, and the Jura mountains. The first large town on its banks is Limoges (Haute-Vienne), below its confluence with the Taurion: in this part of its course the river supplies motive power to paper-mills and other factories. The river next reaches St Junien, below which it turns abruptly northwards to Confolens (Charente). Flowing through a picturesque and now wider valley, and passing in its course the churches and châteaux of Chauvigny, the river proceeds to the confluence of the Clain just above Châtellerault. Below that town it receives the Creuse (rising on the plateau of Millevaches and reaching the Vienne after a course of 159 m.), and turns northwest, uniting with the Loire below the historic town of Chinon. There is little river-traffic on the Vienne, and that only below its confluence with the Creuse (30 m.).

VIENNE, a department of west-central France, formed in 1790 out of Poitou (four-fifths of its present area), Touraine (one-seventh) and Berry, and bounded by Deux-Sèvres on the W., Charente on the S., Haute-Vienne on the S.E., Indre on the E., Indre-et-Loire on the N.E. and N., and Maine-et-Loire on the N.W. Pop. (1906) 333,621. Area, 2719 sq. m. The river Vienne, which gives the department its name, is, there are the Creuse (subtributary of the Garonne) on the east and the Clain on the west, flows from south to north. The general slope of the department is in the same direction, the highest point (764 ft.) being in the south-east and the lowest (113 ft.) at the junction of the Vienne and the Creuse. In the south the Charente, on the north-west the Dive, and in the west some streams belonging to the basin of the Sèvre-Niortaise drain small portions of the department. The average temperature is 54° F. The prevailing winds are from the south-west and west. The annual rainfall is 24 in.
Wheat, oats and barley are the principal cereals cultivated, other important crops being lucerne, sainfoin, clover, mangel-wurzel, and potatoes. The vines are numerous and the wine is highly esteemed. Oak, ash, alder and birch are the principal forest trees, and among the fruit trees are the chestnut, walnut and almond. Figuring among the products of the département are numerous and the wool-spinning industry is well developed.

The most industrious of the occupations are the national arms manufacture at Châtellerault and the cutlery works near that town. In other parts of the department we find hemp-spinning mills, manufactures of soap and candles and the manufacture of cheese and goat's cheese, and numerous flour-mills. Corn, wine, brandy, vegetables, fruit, chestnuts, fodder, cattle, stone, cutlery, arms and dressed hides are exported; there are distilleries, cutlery, manufactory of skins, and other products are exported.

The administration of the department is highly esteemed. Many of the churchmen who have nome statesmen have been of the administrative body, and many have been distinguished by their intellect and industry. The most important of these are the Bishops of Poitiers, its own bishops, and other bishops of the region of the 19th century. The present bishop is, certainly known to be Vector, who was present at the Council of Arles in 314. About 430 Vienne became an archbishopric and was restored by Pope St. Trophime in 1075, when the see was suppressed. The archbishops were disputing with those of Lyons the title of "Primate of All the Gauls." Vienne was conquered by the Burgundians in 438, and in 1534 was taken by the Franks. Sacked in 558 by the Lombards and in 737 by the Saracens, the government of the district was given by Charles the Bold in 869 to a certain Count Boso, who in 879 was proclaimed king of Provence, and was buried on his death in 887 in the cathedral church of St. Maurice. Vienne continued to form part of the kingdom of Provence or Arles till in 1052 it reverted to the Holy Roman Empire. The sovereigns of that kingdom, as well as the emperors of the 12th century (in particular Frederick Barbarossa in 1153), recognized the rights of the archbishops as the rulers (in the name of the emperor) of Vienne. But the growing power of the counts of Albigeois, later Dauphins of the neighbouring county of the Viennois, was the cause of many disputes between them and the archbishops. In 1349 the reigning Dauphin sold his Dauphiné to France, but the town of Vienne was not included in this sale, and the archbishops did not give up their rights over it to France till 1449, when it first became French. In 1511-12 the fifteenth General Council was held at Vienne, when Cardinal Vertu abolished the order of the Knights Templar. Vienne was sacked in 1562 by the Protestants under the banner of the Adrets, and was held for the Ligue 1590-95, when it was taken in the name of Henri IV. by Montmorency. The fortifications were demolished between 1589 and 1656. In 1790 the archbishopric was abolished, the title "Primate of All the Gauls" being attributed to the archbishops of Lyons. Among famous natives of Vienne may be mentioned St. Julian (3rd century) and Nicholas Chortter (1612-1662), the historian of the Dauphiné, while Gué de Bourgogne, who was bishop 1590-1119, became pope in 1199 as Calixtus II. (d. 1214).

Vienne was originally the capital of the Allobroges, and became a Roman colony about 47 B.C. under Caesar, who embellished and fortified it. A little later these colonists were expelled by the Allobroges; the exiles then founded the colony of Lyons (Lugdunum). It was not till the days of Augustus and Tiberius that Vienne regained all its former privileges as a Roman colony. Later it became the capital of the Province of Vienne, which was declared to be a Roman province in 21 B.C. and was divided into the two provinces of Poitou and Auvergne. It was also restored to the name of the village, St. Romain en Gal, to the N.W. of St. Colombes. The Gère supplies the motive power to numerous factories. The most important are those which produce cloth (about 30 factories, turning out daily about 15,000 yards), and numerous other industrial establishments (paper mills, iron foundries, brick works, refining furnaces, etc.)

Vienne is rich in megalithic monuments. The streets of the town are narrow and tortuous, but it possesses two Roman monuments of the first class. One is the temple of Augustus and Livia, a rectangular building of the Corinthian order, erected by the emperor Claudius, and inferior only to the Maison Carrée of Nîmes. The other is the basilica of St. Savin near Poitiers, the abbey church of St. Savin being remarkable for its mural paintings; Ligugé, with an abbey church of the 15th and 16th centuries; Châteaux, which has a Romanesque octagonal tower and other remains; and La Rochefoucauld, near a famous abbey, the ruins of a theatre and other Gallo-Roman remains.}

VIENNE, the chief town of an arrondissement of the department of the Isère, France. Historically the first, it is by population (24,619 in 1901) the second city of the department of the Isère, after Grenoble; and the third, after Valence, of the Dauphiné. It is situated on the left bank of the Rhône just below the junction of the Rhône with the Rhone, 20 m. by rail S. of Lyons. On the N., E. and S. the town is sheltered by low hills, the Rhône flowing along its western side. Its site is an immense mass of ancient debris, which is constantly yielding interesting antiquities. On the bank of the Gère are traces of the ramparts of the old Roman city, and on the Mont Pipet (E. of the town) are the remains of an amphitheatre, while the ruined castle there was built in the 13th century on Roman substructures. Several of the ancient aqueducts (one only is now actually in use) are still to be seen, while in the middle of the city some bits of the old Roman roads may still be found.

The streets of the town are narrow and tortuous, but it possesses two Roman monuments of the first class. One is the temple of Augustus and Livia, a rectangular building of the Corinthian order, erected by the emperor Claudius, and inferior only to the Maison Carrée of Nîmes. The other is the basilica of St. Savin near Poitiers, the abbey church of St. Savin being remarkable for its mural paintings; Ligugé, with an abbey church of the 15th and 16th centuries; Châteaux, which has a Romanesque octagonal tower and other remains; and La Rochefoucauld, near a famous abbey, the ruins of a theatre and other Gallo-Roman remains. Vienne is rich in megalithic monuments.
the presidency of Pope Clement V. The transference of the Curia from Rome to Avignon (1309) had brought the papacy under the influence of the French crown; and this position Philip the Fair of France now endeavoured to utilize by demanding from the pope the dissolution of the powerful and wealthy order of the Temple, together with the introduction of a trial for heresy against the late Pope Boniface VIII. To evade the second claim, Clement gave way on the first. Legal trials and acts of violence against the Templars had begun as early as the year 1307 (see TEMPLES); and the principal object of the council was to secure a definite decision on the question of their continuance or abolition. In the committee appointed for preliminary consultation, one section was for the immediate condemnation of the order, and declined to allow it any opportunity of defence, on the ground that it was now superfluous and simply a source of strife. The majority of the members, however, regarded the case as non-proven, and demanded that the order should be heard on its own behalf; while at the same time they held that its dissolution was unjustifiable. Under pressure from the king, who was his host in Vienne, the pope determined that, as the order gave occasion for scandal but could not be condemned as heretical by a judicial sentence (de jure), it should be abolished per modum provisionis seu ordinationis apostolicae; in other words, by an administrative ruling based on considerations of the general welfare. To this procedure the council agreed, and on the 22nd of March the order of the Temple was suppressed by the bull Vox clamantis; while further decisions as to the treatment of the order and its possessions followed later.

Vierge's earlier drawings were announced in the opening speech, regarding measures for the reformation of the Church and the protection of her liberties, took place; and a part of the Constitutions found in the Clementinum, published in 1317 by John XXII., were probably enacted by the council. Still it is impossible to say with certainty what decrees were actually passed at Vienne. Additional decisions were necessitated by the violent disputes which raged within the Franciscan order as to the observance of the rules of St Francis of Assisi, and by the multitude of subordinate questions arising from this. Resolutions were also adopted on the Beguines and their mode of life (see BEGUNES), the control of the hospitals, the institution of instructors in Hebrew, Arabic and Chaldaic at the universities, and on numerous details of ecclesiastical discipline and law.

VIEGE, DANIEL (1581-1604), Spanish painter and draughtsman, was born in Madrid in 1581. He went to Paris in 1607 to seek his fortune, fired by the vivid energy of his national temperament. He became attached to the Monde illustré in 1370, just before the Franco-Prussian War broke out, and, like other artists in the paper, came under the powerful influence of Edmond Morin, the first newspaper draughtsman in France who sought to impart to drawings for journals the character of a work of art. Vierge's earlier drawings, therefore, partly took part of Morin's style; such are, "The Shooting in the Rue de la Paix," "The Place d'Armes at Versailles," "The Loan," "The Great School-Fête of Lyons," "Anniversary of the Fight of Aydes" and "Souvenir of Couillers." Vierge lost no time in proving the extraordinary vigour and picturesque quality of his art. Apart from the contribution of his own original work, he was employed as a drawing master to redress the evil for the engraver, the sketches sent in by artist-correspondents, such as Luc Olivier Merson in Rome and Samuel Urrabieta (Vierge's brother) in Spain. From 1871 to 1878 his individuality became more and more pronounced, and he produced, among his best-known drawings, "Christmas in Spain," "The Republican Meeting in Trafalgar Square," "Attack on a Train in Andalusia," "Feast of St Rosalia in Palermo," "In the Jardin d'Acclimatation." "The Burning of the Library of the Escorial, 1872," "Grasshoppers in Algiers," "Brigandage in Sicily," "Night Fête in Constantinople," "Episode of the Civil War in Spain," "Marriage of the King of Spain," and "The Bull Fight." About this time he illustrated with remarkable dash and skill Victor Hugo's Année terrible (Michel Lévy, 1874, and Hugues, 1879), "1813" (Hugues, 1877) and Les Misérables (1882). His masterpiece of illustration is Michelet's History of France (1876), consisting of 26 volumes containing 1000 drawings. In 1879 he was drawing for La Vie moderne, and then proceeded to illustrate Pablo de Segorbe. While engaged upon this work he was attacked by paralysis in the right arm, but with characteristic energy and courage he set himself to acquire the necessary skill in drawing with the left, and calmly proceeded with the illustrations to the book. In 1891 he illustrated L'Espagnole, by Bergerat, and in 1895 Le Cabaret des trois verts. In 1898 he held, at the Pelletan Gallery in Paris, an exhibition of his drawings for Chateaubriand's Le Dernier Abencerrage ("The Last of the Abencerrages"), and in the following year a comprehensive exhibition of his work (including the illustrations to Don Quixote) at the Art Nouveau Gallery, also in Paris. In 1898 Vierge contributed to L'Image, a magazine devoted to the encouragement of engraving upon wood; and two years later, at the International Exhibition at Paris, he was awarded a grand prix. In 1902 he exhibited at the New Salon a scene from the Franco-Prussian War. He died at Boulougue-sur-Seine in May 1904.

See Roger Marx, L'Image (1868); Béraldi, La Grave au 19e siècle.

VIERSEN, a town of Germany, in the Prussian Rhine province, 11 m. by rail S.W. from Crefeld, and at the junction of lines to München-Gladbach, Venlo, &c. Pop. (1905) 27,577. It has an evangelical and four Roman Catholic churches, among the latter the handsome parish church dating from the 15th century, and various educational establishments. Viersen is one of the chief seats in the lower Rhine country for the manufacture of velvets, silks (especially umbrella covers) and plush.

VIERZON, a town of central France, in the department of Cher, 20 m. N.W. of Bourges by rail. The Cher and the Yère unite at the foot of the hill on which lie Vierzon-Ville (pop. 1906 town, 11,812) and Vierzon-Village (pop. town, 2036; commune, 9710); Vierzon-Bourgneuf (pop. town, 1482) is on the left bank of the Cher. The town has a port on the canal of Berry and is an important junction on the Orléans railway; there are several large manufactories for the production of agricultural machines, also foundries, porcelain, brick and tile works and glass works. A technical school of mechanics and a branch of the Bank of France are among the institutions of the town.

VIETA (or VIET), FRANÇOIS, SEIGNEUR DE LA BAGOTIÈRE (1540-1603), more generally known as FRANÇOIS DE VIET, French mathematician, was born in 1540 at Fontenay-le-Comte, in Poitou. According to F. Ritter, Vieta was brought up as a Catholic, and died in the same creed; but there can be no doubt that he belonged to the Huguenots for several years. On the completion of his studies in law at Poitiers Vieta began his career as an advocate in his native town. This he left about 1567, and somewhat later we find him at Rennes as a councillor of the parlement of Brittany. The religious troubles drove him thence, and Rohan, the well-known chief of the Huguenots, took him under his special protection. He recommended him in 1580 as a "maitre des requêtes" (master of requests); and Henry of Navarre, at the instance of Rohan, addressed two letters to Henry III. of France on the 3rd of March and the 26th of April 1585, to obtain Vieta's restoration to his former office, but without result. After the accession of Henry of Navarre to the throne of France, Vieta filled in 1589 the position of councillor of the parlement at Tours. He afterwards became a royal privy councillor, and remained so till his death, which took place suddenly at Paris in February 1603, but in what manner we do not know; Anderson, the editor of his scientific writings, speaks only of a "praeceps et immaturum autoris fatum."

1 Boletino Boncompagni (Rome, 1868), vol. i. p. 227, n. 1.
We know of one important service rendered by Vieta as a royal officer. While at Tours he discovered the key to a Spanish cipher, consisting of more than 500 characters, and thenceforward all the despatches in that language fell into the hands of the French could be easily read. His fame now rests, however, entirely upon his achievements in mathematics. Being a man of wealth, he printed at his own expense the known mathematical works, which he afterwards, with the help of various branches of this science, and communicated them to scholars in a number of manuscripts.

Vieta's writings thus became very quickly known; but, when Franciscus van Schooten issued a general edition of his works in 1646, he failed to make a complete collection, although probably nothing of very great value has perished.

The form of Vieta's writings is their weak side. He indulged freely in flourishes; and in devising technical terms derived from the Greek he seems to have aimed at making them as unintelligible as possible. Now his is a style, which he himself, in a letter written in 1593, has stood out against; and even his proposal to denote unknown quantities by the vowels A, E, I, O, U, Y—the consonants, c, k, g, w, —being reserved for general known quantities, was not followed up. In this denotation he followed, perhaps, some older contemporaries, and designated the points in geometrical figures by vowels, making use of consonants, R, S, T, &c., only when these were exhausted. Vieta is written, an orthography which no one can think mean, what is often alleged, that nobody before him had ever thought of choosing symbols different from numerals, such as the letters of the alphabet, to denote the quantities of arithmetic, but that he made a general custom of what until his time had been only an exceptional attempt. All that is wanting in his writings, especially in his Igagio in artem analysicam (1591), in order to make them clear to the uninitiated reader, is a compression of the sign of equality—a want which is the more striking because Robert Recorde had made use of our present symbol for this purpose since 1557, and Xylander had employed vertical parallel lines since 1575.

On the other hand, Vieta was well skilled in the art of preparing theorems and problems, and of reducing general propositions to particular applications. The method of simplification of equations by the substitution of new quantities having a certain connexion with the primitive unknown quantities. Another of his works, Recensio conspecta effectuum geometricarum, bears a stamp not less modern, being what we now call an algebraic geometry—in other words, a collection of precepts how to construct algebraic expressions with the use of rule and compasses. These were the germ of the generality, and therefore of the greatest didactic importance, the principle of homogeneity, first enunciated by Vieta, was so far in advance of his times that most readers seem to have passed it over without apprehending its importance. That principle has been known from the Greek authors of the classic age; but of later mathematicians only Hero, Diophantus, &c., ventured to regard lines and surfaces as mere abstractions, which could be joined to give a new number, their sum. It may be that the study of Vieta's sums, the results of his calculations, was the first step towards the development of the science of form, where the objects of study are the properties of the straight line, the plane, the space, and the universe. Vieta, in his works on Diophantus, prompted him to lay it down as a principle that quantities occurring in an equation ought to be homogeneous, all of them lines, or surfaces, or solids, or superordinates; an equation between mere numbers being inadmissible. During the three centuries that have elapsed between Vieta's day and our own several changes of opinion have taken place on this subject, and the principle has at last proved so far victorious that modern mathematicians like to make homogeneous such equations as are not so from the beginning, in order to get values of a symmetrical shape, of course, in the most general case. Nevertheless the merit cannot be denied him of having indirectly suggested the thought. Nor are his writings lacking in actual inventions. He conceived methods for the general resolution of equations of the second, third and fourth degrees different from those of Ferro and Ferrari, with which, however, it is difficult to believe he has been unacquainted. He devised an approximate numerical solution of equations of the second and third degrees, wherein Leonardo of Pisa must have preceded him by a long time. He also gave a problem to all mathematicians an equation of the 45th degree, which, being recognized by Vieta as depending on the equation between sin φ and sin φ/45, was resolved by him at once, all the twenty-three positive roots of which the said equation was capable being given at the same time (see Trigonometry). Such was the first encounter of the two scholars. A second took place when Vieta pointed to Apollonius's problem of tactic as not yet mastered, and he published himself, in Apollonius Galilaei presentibus, a solution of the problem which he discovered by the hyperbola. Vieta, however, did not accept it, as there existed a solution by means of the rule and the compass only, which he published himself in his Apollonius Galilaei presentibus. In this paper Vieta made use of the centre of similitude of two circles. Lastly he gave an infinite product for the number π (see Circle, Squaring of).

Vieta's collected works were issued under the title of Opera Mathematica in 1615, and again in a revised edition at Leiden in 1626. (M. C.)

**VIEUXTEMPS, HENRI** (1852-1881), Belgian violinist and composer, was born at Verviers, on the 20th of February 1852. Until his seventh year he was a pupil of Lecloux, but when De Bériot heard him he adopted him as his pupil, taking him to appear in Paris in 1858. From 1833 onwards he spent the greater part of his life in concert tours, visiting all parts of the world with uniform success. He first appeared in London at a Philharmonic concert on the 8nd of June 1834, and in the following year at Paris. He published himself in his Apollonius Galilaei presentibus, a solution of the problem which he discovered by the hyperbola. His staccato was famous all over the world, and his tone was exceptionally rich and full.

**VIGAN,** a town and the capital of the province of Ilocos Sur, Luzon, Philippine Islands, at the mouth of the Abra river, about 200 m. N. by W. of Manila. Pop. of the municipality (1903) 14,945; after the census of 1903 was taken there were united to Vigan the municipalities of Bantay (pop. 7020), San Vicente (pop. 5060), Santa Catalina (pop. 5625) and Cagayan (pop. 6209), making the total population of the municipality 39,852. Vigan is the residence of the bishop of the diocese of Segovia and has a fine cathedral, a substantial court-building, and the building of boats. The language is Ilocano.

**VIGEE-LEBRUN, MARIE-ANNE ELISABETH** (1755-1842), French painter, was born in Paris, the daughter of a painter, from whom she received her first instruction, though she benefited more by the advice of Doyen, Greuze, Joseph Vernet and other masters of the painting Art; she was occupied about twenty years of age she had already risen to fame with her portraits of Count Orloff and the duchess of Orleans, her personal charm making her at the same time a favourite in society. In 1776 she married the painter and art-critic J. B. P. Lebrun, and in 1783 her picture of "Peace bringing back Abundance" (now at the Louvre) gained her the membership of the Academy. When the Revolution broke out in 1789, she escaped first to Italy, where she worked at Rome and Naples. At Rome she painted the portraits of Princesses Adelaide and Victoria, and at Naples the "Lady Hamilton as a Bacchante," now in the collection of Mr Tankelle's Chambly. After a journey to Vienna, Berlin and St Petersburg, she returned to Paris in 1781, but went in the following year to London, where she painted the portraits of Lord Byron and the prince of Wales, and in 1808 to Switzerland. Her numerous journeys, and the vogue she enjoyed wherever she went, account for the numerous portraits from her brush that are to be found in the great collections of many countries. Having returned to France from Switzerland, she lived first at her country house near Marly and then in Paris, where she died at the age of eighty-eight, in 1842. It has been estimated for two hundred years. She published her own memoirs under the title of Souvenirs (Paris, 1835-37). Among her many sitters was
VIGEVO—VIGILANCE COMMITTEE

Marie Antoinette, of whom she painted over twenty portraits between 1770 and 1789. A portrait of the artist is in the hall of the painters at the Uffizi, and another at the National Gallery. The Louvre owns two portraits of Mme Lebrun and her daughter, besides five other portraits and an allegorical composition.

A full account of her eventful life is given in the artist’s Sauterne, and in C. Pillet’s Mme Vigée-Le Brun (Paris, 1890). The artist’s autobiography has been translated by Lionel Strachey, Memoirs of Mme Vigée-Lebrun (New York, 1903), fully illustrated.

VIGEVO, a town and episcopal see of Lombardy, Italy, in the province of Pavia, on the right bank of the Ticino, 24 m. by road from the town of the line to Mortara, 38 ft. above sea level. Dep. (1901) 18,048, of whom 3,658 are (complied with 1861). It is a medieval walled town, with an arcaded market-place, a cathedral, the Gothic church of S. Francesco, and a castle of the Sforza family, dating from the 14th century and adorned with a loggia by Bramante and a tower imitating that of Filarete in the Castello Sforzesco at Milan. It is a place of some importance in the silk trade and also produces excellent macaroni. There is a steam tramway to Novara.

VIGFUSSON, GUDBRANDUR (1528-1588), the foremost Scandinavian scholar of the 16th century, was born of a good and old Iceland-sired (with Urness), Bremsbury, in 1528. He is said to have brought up till he went to a tutor’s, by his kinswoman, Kristina (his dottor, to whom, he records, he “owed not only that he became a man of letters, but almost everything.” He was sent to the old and famous school at Bessastad and (when it removed thither) at Reykjavik; and in 1549, already a fair scholar, he came to Copenhagen University as a bursarius in the Regense College. He was, after his student course, appointed stipendiarius by the Anna-Magnaean trustees, and worked for fourteen years in the Anna-Magnaean Library till, as he said, he knew every single volume of the Iceland-sired written paper in that whole collection. During his Danish life he has himself revisited Iceland (last in 1585), and made short tours in Norway and South Germany with friends. In 1566, after some months in London, he settled down in Oxford, which he made his home for the rest of his life, only quitting it for visits to the great Scandinavian libraries or to London (to work during two or three long vacations with his fellow-labourer, F. Y. Powell), or for short trips to places such as the Isle of Man, the Orkneys and Shetlands, the old moor-stead of the West Saxons at Downton, the Roman station, Cartumney, the burial-place of Bishop Brynjulf’s ill-fated son at Yarmouth, and the like. He held the office of Reader in Scandinavian at the university of Oxford (institutus and created for him) from 1584 till his death. He was a Jubilee Doctor of Upsala, 1877, and received the Danish order of the Dannebrog in 1885. Vigfusson died of cancer on the 31st of January 1889, and was buried in St Sepulchre’s Cemetery, Oxford, on the 3rd of February. He was an excellent judge of literature, reading most European languages well and being acquainted with their classics. His memory was remarkable, and if the whole of the Edda poems had been lost, he could have written them down from memory. He spoke English well andidiomatically, but with a strong Icelandic accent. He wrote a beautiful, distinctive and clear hand, in spite of the thousands of lines of MS. copying he had done in his early life.

By his Tútalið (written between October 1534 and April 1585) he laid the foundations for the chronology of Icelandic history, in a series of conclusions that have not been displaced (save by his own additions and corrections), and that justly earned the praise of Jacob Grimm. His editions of Icelandic classics (1588-68), Bisopav Sögur, Bards Saga, Forn Sögur (with Möbus), Eyvbygging Saga and Skaldic Poems, etc., have made the Icelandic scholarship, and can only fitly be compared to the Rolls Series edition of chronicles by Dr Stubbs for the interest and value of their prefaces and texts. Seven years of constant and severe toil (1566-73) were given to the Oxford Icelandic-English Dictionary, incomparable as the best guide to classic Icelandic, and a monumental example of single-handed work. His later series of editions (1874-85) included Oðars saga (a collection of Sögur, the great and complex mass of Icelandic historical sagas, under Sæmund’s known as the Poeticum Boreale), in which he edited the whole body of classic Scandinavian poetry. As an introduction to the Sturlunga, he wrote a complete though concise history of the classic Northern

literature and its sources. In the introduction to the Corpus, he laid the foundations of a critical history of the Eddic poetry and Court poetry of the North in a series of brilliant, original and well-substantiated theories that are gradually being accepted even by those who were at first inclined to reject them. His little Icelandic

Prose Reader (with F. York Powell) (1879) furnishes the English student with a pleasant and trustworthy path to a sound knowledge of the language. The Corpus Poetiarum Scandicarum (1886) give good examples of the range of his historic work, while his Appendix on Icelandic currency to Sir G. W. Daunt’s Burnt Njal is a model of methodological investigation and a study of a kind and somewhat important subject. As a writer in his own tongue he has once again made a high mark by his excellent and delightful Relations of Travel in Norway and South Germany, in English, as his “Visit to Grimm,” and his finished and charming Travels to the Tuscan Hills, and his VITA, which is a model account of his the life is a record of three efficient and well-directed labour in Denmark and Oxford.

VIGIL (Late Vigilia, “watch”), in the Christian Church, the eve of a festival. The use of the word is, however, late, the

vigilae (pernoctationes, σνυρακθές) having originally been the services, consisting of prayers, hymns, processions and sometimes the eucharist, celebrated on the preceding night in preparation for the feast. The oldest of the vigils is that of Easter Eve, the vigil of Pentecost and Christmas.

The abbeys connected with night vigils 1 led to their being attacked, especially by Vigilantius of Barcelona (c. 400), against whom Jerome fulminated in this and as other matters. The custom, however, increased, vigils being instituted for the other festivities, including those of saints.

In the middle ages the nocturnal vigil were, except in monasteries, gradually discontinued, matins and vespers on the preceding day, with fasting, taking their place. In the Roman Catholic Church the vigil is now usually celebrated on the morning of the day preceding the festival, except at Christmas, when a midnight mass is celebrated, and on Easter Eve. These vigils are further distinguished as privileged and unprivileged. The former (except that of the Epiphany) have special offices; in the latter the vigil is merely commemorated.

The Church of England has reverted to early custom in so far as only “Easter Even” is distinguished by a special collect, gospel and epistle. The other vigils are recognized in the calendar (including those of the saints) and the rubric directs the ushers to collect appropriate fasting and Holy Day that habits of the Vigil or Easter Eve, shall be said at the evening Service next following.

VIGILANCE COMMITTEE, in the United States, a self-constituted judicial body, occasionally organized in the western frontier districts for the protection of life and property. The first committee of prominence bearing the name was organized in San Francisco in June 1851, when the crimes of desperadoes who had immigrated to the gold-fields were rapidly increasing in numbers and it was said that there were venal judges, packed juries and false witnesses. At first this committee was composed of about 200 members; afterwards it was much larger. The general committee was governed by an executive committee and the city was policed by sub-committees. Within about thirty days four desperadoes were arrested, tried by the executive committee and hanged, and about thirty others were banished. Satisfied with the results, the committee then quietly adjourned, but it was revived five years later. Similar committees were common in other parts of California and in the mining districts of Idaho and Montana. That in Montana exterminated in 1863-4 a band of outlaws organized under Henry Plummer, the sheriff of Montana City; twenty-four of their number were hanged within a few months. Committees or societies of somewhat the same nature were formed in the Southern states during the Reconstruction period (1865-72) to protect white families from negroes and “carpet-baggers,” and besides these there were the Ku-Klux-Klan (q.v.) and its branches; the Knights of the White Camelia, the Pale Faces, and the Invisible Empire of the South, the principal object of which was to control the negroes by striking them with terror.

1 The 35th congress of the council of Elvira (305) forbids women to attend them.
The Vigilantius controversy.

They reached the city of Aquitania, where Vigilantius, the presbyter, celebrated as the author of a work, no longer extant, against superstitious practices, which called forth one of the most violent and scurrilous attacks of Jerome’s polemical treatises, was born about 370 at Calagurris in Aquitania (the modern Cazères or perhaps Saint Bertrand de Comminges in the department of Haute-Garonne), where his father kept a “stato” or inn on the great Roman road from Aquitania to Spain. While still a youth his talent became known to Sulpicius Severus, who had estates in that neighbourhood, and in 395 Sulpicius, who probably baptized him, sent him with letters to Paulinus of Nola, where he met with a friendly reception. On his return to Severus in Gaul he was ordained; and, having soon afterwards inherited means through the death of his father, he set out for Palestine, where he was received with great respect by Jerome at Bethlehem.

The stay of Vigilantius lasted for some three years, and it is not at all strange that he should have dragged himself into the dispute then raging about Origen, in which he did not see it wholly to adopt Jerome’s attitude. On his return to the West he was the bearer of a letter from Jerome to Paulinus, and at various places where he stopped on the way he appears to have expressed himself about Jerome in a manner that when reported gave great offence to that father, and provoked him to write a reply (Ep. 61). Vigilantius—now settled for some time in Gaul, and is said by one authority (Gennadius) to have afterwards held a charge in the diocese of Paris—was born about 370. After his return from the East, Vigilantius wrote his celebrated work against superstitious practices, in which he argued against the adoration of saints and relics. All that is known of his work is through Jerome’s treatise Contra Vigilantium, or, at least, a controversy would seem to prefer saying, “Contra Dormitantium.”

Notwithstanding Jerome’s exceedingly unfavourable opinion, there is no reason to believe that the tract of Vigilantius was exceptionally illustrative, or that the views it advocated were exceedingly “heretical.” Soon, however, the great influence of Jerome in the Western Church caused its leaders to espouse all his quarrels, and Vigilantius gradually came to be ranked in popular opinion among heretics, though his influence long remained potent both in France and Spain, as is proved by the polemical tract of Faustus of Rhenium (d. c. 490).

Vigilius, pope from 537 to 555, succeeded Silverius and was followed by Pelagius I. He was ordained by order of Belisarius while Silverius was still alive; his elevation was due to Theodora, who, by an appeal at once to his ambition and, it is said, to his covetousness, had induced him to promise to disallow the council of Chalcedon, in connexion with the “three chapters” controversy. When, however, the time came for the fulfilment of his bargain, Vigilius declined to give his assent to the condemnation of that council involved in the imperial edict against the three chapters, and for this act of disobedience he was peremptorily summoned to Constantinople, which he reached in 547. Shortly after his arrival there he issued a document known to history as his Judicatum (548), in which he condemned indeed the three chapters, but expressly disavowed any intentions thereby to disparage the council of Chalcedon. After a good deal of trimming (for he desired to stand well with his own clergy, who were strongly orthodox, as well as with the court), he prepared another document, the Constitutum ad Imperatorem, which was laid before the emperor, with the request that he might be displaced by his condemnation by the majority of that body, some say even to his banishment. Ultimately, however, he was induced to assent to and confirm the decrees of the council, and was allowed after an enforced absence of seven years to set out for Rome. He died, however, at Syracuse, before he reached his destination, on the 7th of June 555.

Vigintiseverus, in Roman history, the collective name given in republican times to “twenty-six” magistrates of inferior rank. They were divided into six boards, two of which were abolished by Augustus. Their number was thereby reduced to twenty and their name altered to vigintiviri (“the twenty”). They were originally nominated by the higher magistrates, but subsequently elected in a body at a single sitting of the comitia tributa; under the empire they were chosen by the senate. The following are the names of the six boards: (1) Tresviri capitales (see Tresviri); (2) Tresviri monetales; (3) Quatuorviri viis in urbe purgandis, who had the care of the streets and roads inside the city; (4) Duoviri viis extra uram purgandis (see Duoviri), abolished by Augustus; (5) Decemviri aediles judicandis (see Decemviri); (6) Quatuorviri Capitales, abolished by Augustus. The members of the last-named board were appointed by the praetor urbanus of Rome to administer justice in ten Campanian towns (list in Mommsen), and received their name from the two most important of these. They were subsequently elected by the people under the title of quatuorviri jure dicundo, but the date is not known.

See Mommsen, Römisches Staatsrecht, ii. (1887), p. 592.

Viglius, the name taken by Wigm van Attia van Zuchem (1507–1577), Dutch statesman and jurist, a Friesian by birth, and who, at the age of 20, was made a prebendary of the church of Delft. He became a great friend of Philip the Second and was received into the chancery of Dole in 1535, and was later made a councilor with the title of “general” of the Netherlands. He was elected a member of the council of Mechlin, and spent many years there. He was subsequently made a member of the council of Breda, and finally placed in the council of the city of Antwerp. He was, however, not always successful in his efforts to reconcile the emperor with the emperor, but was instrumental in bringing about a truce between the two powers, and was eventually rewarded with the title of “grand councilor” and a pension of 50,000 ducats.

opposed the duke's scheme of extortion, and sought to induce Philip to himself to visit the Low Countries. His health was now impaired and his work was nearly over. Having suffered a short imprisonment with the other members of the state council in 1576, he died at Brussels on the 5th of May 1577, and was buried in the abbey of St Bavon.

Viglius was an advocate of peace and moderation, and as such could not expect support or sympathy from men engaged in a life-and-death struggle for liberty, or from their relentless enemies. He was undoubtedly avaricious, and accumulated great wealth, part of which he left to found a hospital in his native place, Zwischen, and a college at the university of Louvain. He married a rich lady, Jacqueline Damant, but had no children.

He wrote a Tagebuch des Schmähsatidens Denauwrig, edited by A. von Druijff (Munich, 1877), and some of his lectures were published under the title Commentarii in decem Institutionum vulos (Lyons, 1562). His Vita et opera historicis are given in the Annales Belgicae of C. P. Huygen van Papendrecht (the Hague, 1743). See L. P. Gachard, Correspondance de Philippe II. sur les affaires des Pays-Bas (Brussels, 1846-79); and Correspondance de Marguerite d'Auvergne, duchesse de Parme, with Philippe II. (Brussels, 1867); and E. Roull, Correspondance de cardinal de Granvelle (Brussels, 1877-81).

VIGNY, PAUL DE (1834-1901), Belgian sculptor, was born at Ghent. He was trained by his father, a statuary, and began by exhibiting his "Fra Angelico da Fiesole" at the Ghent Salon in 1868. In 1872 he exhibited at the Brussels Salon a marble status, "Heliotrope" (Ghent Gallery), and in 1875, at Brussels, "Beatriz" and "Domenica." He was employed by the government to execute carvings for the conservatoire at Brussels. In 1876 at the Antwerp Salon he had busts of E. H. and W. Wilson, which were afterwards placed in the communal museum at Brussels. Until 1882 he lived in Paris, where he produced the marble status "Immorality" (Brussels Gallery), and "The Crowning of Art," a bronze group on the façade of the Palais des Beaux-Arts at Brussels. His monument to the popular heroes, Jean Breydel and Pierre de Coninck, was unveiled at Bruges in 1887. At his death he left unfinished his principal work, the Anspach monument, which was erected at Brussels under the direction of the architect Janlet with the co-operation of various sculptors. Among other notable works by De Vigne may be mentioned "Volumnia" (1875); "Poverella" (1878); a bronze bust of "Psyche" (Brussels Gallery), of which there is an ivory replica; the marble status of Marnix de Ste Alekonde in the Square du Sablon, Brussels; the Metopenningen monument in the cemetery at Ghent; and the monument to Canon de Haerne at Courtrai.

See E. L. Detage, Les Artistes Belges contemporains (Brussels), and O. G. Destre's, The Renaissance of Sculpture in Belgium (London, 1895).

VIGNETTE (Fr. for "little vine"), in architecture, a running ornament, representing, as its main vine, a little vine, with branches, leaves and grapes. It is common in the Tudor period, and runs or roses in a large hollow or covegement. It is also called trèzel. From the transference of the term to book-illustration resulted the sense of a small picture, vanishing gradually at the edge.

VIGNY, ALFRED DE (1797-1863), French poet, was born at Loches (Indre-et-Loire) on the 27th of March 1797. Sainte-Beuve, in the rather ill-natured essay which he devoted to Vigny after his death, expresses a doubt whether the title of count which the poet bore was well authenticated, and hints that no very ancient proofs of the nobility of the family were forthcoming; but it is certain that in the 18th century persons of the name occupied positions which were not open to any but men of noble birth. For generations the ancestors of Alfred de Vigny had been soldiers, and he himself joined the army, with a commission in the Household Troops, at the age of sixteen. But the Revolutionary and Napoleonic wars were over, and after twelve years of life in barracks he retired, preserving, however, a very high estimate of the duties and career of the soldier. While still serving he had made his mark, if as yet unrecognized, by the publication in 1822 of a volume of poems, and in 1826 by another, together with the famous prose romance of Cinque-Mars. Sainte-Beuve asserts that the poet antedated some of his most remarkable work. This may or may not be the case; he certainly could not antedate the publication. And it so happens that some of his most celebrated pieces—Elia, Dolorida, Moïse—appeared (1822-23) before the work of younger members of the Romantic school whose productions strongly resemble these poems. Nor is this originality limited to the poems which were first published in the "Recueil des Poésies" in 1827—that they were "the first of their kind in France, in which philosophic thought is clothed in epic or dramatic form." Indeed this claim is disputable in itself, and has misled not a few of Vigny's recent critics. It is in poetic, not philosophic, quality, that his idiosyncrasy and preciosity are most remarkable. It is quite certain that the other Alfred—Alfred de Musset—felt the influence of his elder namesake, and an impartial critic might discern no insignificant marks of the same effect in the work of Hugo himself. Even Lamartine, considerably Vigny's elder and not so much of a successor, seems rather to have been guided by Vigny than Vigny by him. No one can read Dolorida or Le Cor without seeing that the author had little to learn from any of his French contemporaries and much to teach them. At the same time Vigny, from whatever cause, hardly make any further public appearance in poetry proper during the more than thirty years of his life, and his entire poems, including posthumous fragments, form but one very small pocket volume. Cinque-Mars, which at least equalled the poems in popularity, will hardly stand the judgment of posterity well. It had in its favor a support of the Royalist party, the immense vogue of the novels of Walter Scott, on which it was evidently modelled, the advantages of an exquisite style, and the taste of the day for the romance as opposed to the novel of analysis. It therefore gained a great name both in France and abroad. But any one who has read it critically must acknowledge it to be disappointing. The action is said to be dramatic; if it be so, it can only be said that this proves very conclusively that the action of drama and the action of the novel are two quite different things. To the reader who knows Scott or Dumas the story is singularly uninteresting (far less so than the poem itself), the characters want life; and the book generally stagnates.

Its author, though always as a kind of outsider (the phrase constantly applied to him in French literary essays and histories being that he shot himself up in a tour d'écriture), attached himself more or less to the Romantic movement of 1830 and the years immediately preceding and following it, and was stimulated by this movement both to drama and to novel-writing. In the year before the revolution of July he produced at the Théâtre Français a translation, or rather paraphrase, of Othello, and an original piece La Mardoché d'Ancre. In 1832 he published the curious book Stello, containing studies of unlucky youthful poets—Gilbert, Chatterton, Chénier—and in 1835 he brought out his drama of Chatterton, which, by the hero's suicide, shocked French taste even after five years of Romantic education, but had a considerable success. The same year saw the publication of Servitude et grandeur militaires, a singular collection of sketches rather than a connected work in which Vigny's military experience, his idea of the soldier's duties, and his rather poetical views of history were all worked in. The subjects of Chatterton and Othello naturally suggest a certain familiarity with English, and in fact Alfred de Vigny knew English well, lived in England for some time and married in 1828 an Englishwoman, Lydia Bunbury. His father-in-law was, according to French gossip, so conspicuous an example of insular eccentricity that he never could remember his son-in-law's name or anything about him, except that he was a poet. By this, and the kindness of casual Frenchmen who went through the list of the chief living poets of their country, he was sometimes able to discover his daughter's husband's designation. In 1845 Alfred de
Vigny was elected to the Academy, but made no compromise in his "discourse of reception," which was un Winningly Romantic. Still, he produced nothing save a few scraps; and, beyond the work already enumerated, little has to be added except his Journal d’un poète and the poems called Les Destinées, edited, with a few fragments, by Louis Ratisbonne after his death. Among his dramatic work, however, should be mentioned Quoîte pour la pêcher and an adaptation of the Merchant of Venice called Skyluck. Les Destinées excited no great admiration in France, but they were at least published in some highly- esteemed poetry (including the austere kind, such as the magnificent speech of Nature in "La Maison du berger") and the remarkable poem entitled "La Colère de Samson." Vigny died at Paris on the 17th of September 1863.

His later life was almost wholly uneventful, and for the most part, as has been said, spent in retirement. His reputation, however, is perfectly secure. It may, and probably will, rest only on his small volume of poems, though it will not be lessened, as far as qualified literary criticism is concerned, should the reader proceed to the rest of the work. The whole of his non-dramatic verse does not amount to two lines; it may be a good deal less. But the range of his subject is comparatively wide, and extraordinary facility of execution, not merely in language, but in thought, is evident throughout. Vigny, as may be seen in the speech of Nature referred to above, had the secret of the essentially beautiful with French grace, and attacked it without grandiosity, by means of an almost classical precision and gravity of form. The defect of volatility, of never leaving off, which makes most of Hugo's works (Hugo, in his time, and in him, and he is equally free from the looseness and disorderliness of form which are sometimes blemishes in Musset, and from the effeminacy of Lamartine, while once more his nobility of thought and pleasantness of style have him in a different rank to a different school thought to rest on the technically perfect work of Théophile Gautier. The dramatic work is, perhaps, less likely to interest English than French readers, the local colour of Chatterton being entirely false, the sentiment conventional in the extreme, and the real paths of the story exchanged for a commonplace devotion on the poet's part to his host's wife. In the same way, the finest passages of Othello simulate Vigny's verse. In his remaining works the defect of skill in managing the plot and characters of prose fiction, which has been noticed in Cing-Mara, reappears, together (in the case of the Journal d'un poète and elsewhere) with signs of the fastness and slightness which are seen in Hugo. Vigny was Vigny as a man. In his poems proper none of these faults appears, and he is seen wholly at his best. It should be said that of his posthumous work not a little had previously appeared piecemeal in the Revue des deux Mondes, to which he was an occasional contributor. The prettiest of the complete editions of his works (of which there are several) is to be found in what is called the Petite bibliothèque Charpentier. For information general attention is invited to the following: Recendly there has been a revival of interest as shown by monographs: M. Paléologue's "Alfred de Vigny" in the Grands écrivains français (1861); L. Dorison's Alfred de Vigny, poète-philosophe (1895); J. Vitalis's Alfred de Vigny, les éditions originales de sa poésie (1893); E. Dupuy's La Jeunesse des Romantiques (1903); and E. Lauvriere's Alfred de Vigny (Paris, 1910). But is most of these rather excessive attention has been paid to the "philosophy" of a pessimistic kind which succeeded Vigny's early Christian Romanticism. This, though not unworthy, is separable from his real poetical quality, and concentration on it rather obscures the latter, which is of the rarest kind. It should be added that an interesting sidelight has been thrown on Vigny by the publication (1905) of his Fragments inédits sur P. et T. Corneille.

VIKING.

VIKO, a seaport and naval station of north-western Spain, in the province of Pontevedra; on Vigo Bay (Ría de Vigo) and on a branch of the railway from Tuy to Corunna. Pop. (1890) 23,250. Vigo Bay, one of the finest of the Galician fjords, extends inland for 10 m., and is sheltered by low mountains and by the islands (Islas de Cies, ancient Insecte Siccus) at its mouth. The town is built on the south-eastern coast, and occupies a hilly site dominated by two obsolete forts. The older streets are steep, narrow and tortuous, but there is also a large modern quarter. Vigo owes its importance to its deep and spacious harbour, and to its fisheries. It is a port of call for many lines trading between Western Europe and South America. Shipbuilding is carried on, and large quantities of fish are canned for export. In 1899, 2041 ships of 2,710,601 tons (ex. 1,554,782), besides 369, the imports in that year, including tin and tapanite, coal, machinery, cement, sulphate of copper and foodstuffs, were valued at £81,752; the exports, including sardines, mineral waters and eggs, were valued at £55,824. The town contains flour, paper and sawmills, sugar and petroleum refineries, tanneries, distilleries and soap works; it has also a large agriculural trade and is visited in summer for sea-bathing.

Vigo was attacked by Sir Francis Drake in 1582 and 1589. In 1792 a combined British and Dutch fleet under Sir George Rooke and the duke of Ormonde destroyed a Franco-Spanish fleet in the bay, and captured treasure to the value of about £1,000,000; numerous attempts have been made to recover the larger quantity of treasure which was supposed, on doubtful evidence, to have been sunk during the battle. In 1796 Vigo was captured by the British under Viscount Cobham.

VIJAYANAGAR, or BIJAPUR ("the city of victory"), an ancient Hindu kingdom and ruined city of southern India. The kingdom lasted from about 1336 to 1565, forming during all that period a bulwark against Mahomedan invasion from the north. Its foundation, and even great part of its history, is obscure; but its power and wealth are attested by more than a thousand miles of fortifications, and by the character of the existing ruins. At the beginning of the 14th century Mahomedan raiders had effectually destroyed every Hindu principality throughout southern India, but did not attempt to occupy the country permanently. In this state of desolation Hindu nationality rose again under two brothers, named Hariraha and Bukka, of whom little more can be said than that they were Kanarese by race. Hence their kingdom was afterwards known as the Carnatic. At its widest extent, it stretched across the peninsula from sea to sea, from Masulipatnam to India, and even beyond the limits of the south acknowledged its supremacy. The site of the capital was chosen, with strategic skill, on the right bank of the river Tungabhadra, which here runs through a rocky gorge. Within thirty years the Hindu Rayas of Vijayanagar were able to hold their own against the Bahmani sultans, who had now established their independence of Delhi in the Deccan proper. Warfare with the Mahomedans across the border in the Raichur doab was carried on almost unceasingly, and with varying result. Two, or possibly three, different dynasties are believed to have occupied the throne of Vijayanagar, as time went on; and its final downfall may be ascribed to the domestic discontents thus produced. This occurred in 1565, when the confederate sultans of Bijapur, Ahmednagar and Golconda, who had divided amongst themselves the Bahmani dominions, overwhelmed the Vijayanagar army in the plain of Talikota, and sacked the defenceless city. The Raya fled south to Penukonda, and later to Chandragiri, where one of his descendants granted to the English the site of Fort St George or Madras. The city has ever since remained a wilderness of immense ruins, which are now conserved by the British government.
to whom a saga is dedicated: who possessed rather peculiar institutions evidently the relic of what is now called the Viking Age, that preceded the Saga Age by a century. Another instance of such more generic use occurs in the following typical passage from the Landnámabók (Sturlabók), where it is recorded how Harald Fairhair harried the Vikings of the Scottish isles—that famous harrying which led to most of the settlement of Iceland and the birth of Icelandic literature:

"Haraldr en harfari herjaði vestr am haf ... Hann lagði "undir sig allar" Sudreyjar ... En er hann for ystann slogsgru ... 1"

At this Viking Age, the Saxo-Norse literature we have preserved is to a large extent the fruit of the eighteenth and nineteenth centuries. That is why this book ends with the 1800s, with the publication of the monumental work of Steenstrup, and with the discovery of the Viking Age. The Viking Age was an age of war and pirates, an age of conquest and plunder. It was an age of danger and adventure, an age of glory and fame. It was an age of progress and innovation, an age of change and development.

The Viking Age was the age of the Vikings. It was a time of great expansion and exploration, a time of great wealth and power. It was a time of great creativity and innovation, a time of great achievement and success. It was a time of great challenge and opportunity, a time of great promise and potential.

The Viking Age was a time of great change and turmoil. It was a time of great struggles and conflicts, a time of great losses and gains. It was a time of great losses and gains, a time of great successes and failures. It was a time of great persistence and perseverance, a time of great determination and dedication.

The Viking Age was a time of great change and progress. It was a time of great developments and discoveries, a time of great advancements and innovations. It was a time of great changes and improvements, a time of great developments and advancements.

VIKING

This brief sketch may be taken as the prototype of viking invasion of any region of western Christendom which was the object of their continuous attacks. Of such regions we may distinguish five. The west was simultaneously with the attacks on Ireland came others, probably also from Norway, on the western regions (coasts and islands) of Scotland. Plunderings of Iona are mentioned in A.D. 802, 806. In the course of a generation almost all the monastic communities in western Scotland had been destroyed. But details of these viking plunderings are wanting. On the continent there were three distinct regions of attack. First the mouth of the Scheldt. There the Danes very early settled on the island of Walcheren, which had in fact been given by the emperor Louis the Pious in lieu to Louis, the king, and named after him, who supported the help of Louis, and adopted Christianity. After the partition of the territory of Charlemagne's empire among the sons of Louis the Pious, Walcheren and the Scheldt-mouth fell within the possessions of the emperor Lothair, and in the region subsequently distinguished as Lotharingia. From this centre, the Scheldt, the viking raids extended on either side; sometimes eastward as far as the Rhine, and so into Germany proper, the territory assigned to Louis the German; at other times westward to the Somme, and thus into the territory of Charles the Bald, the future kingdom of France. In the event, toward the end of the 9th century all Frisian and East Teutonic, and the German Ocean seems to have become the permanent possession of the invaders. In like fashion was it with the next district, that of the Seine, only that here no important island served the pirates for their first arsenal and winter quarters. The serious attacks of the pirates in any part of this region distant from their own lands begin about the time of the battle of Fontenoy between Louis' sons (A.D. 841). The first wintering of the vikings in the Seine territory (A.D. 850) was in "Givoldi fossa," the tomb of one Givodius, not far from the mouth of the river, but northward. Their first attack on Paris was in A.D. 845: a much more important but unsuccessful one took place in A.D. 883-87, unsuccessful that is so far as the city itself was concerned; but the invaders received an indemnity for raising the siege and leave to pass beyond Paris into Burgundy. The settlement of Danes under Rollo or Roll on the lower Seine, i.e. in Normandy, dates from the treaty of St Clair-sur-Epte, A.D. 912 (or 911).

The third region is the mouth of the Loire. Here the island point d'appui was Noirmoutier, an island with an abbey at the Loing; its position in the Loire estuary and the course of the Loire in this region was more often ravaged than that of the lower Loire, so rich in abbeys—St Martin of Tours, Marmoutiers, St Benedict, &c. But the country ceded to the vikings under Hastig at the Loire mouth was insignificant and not in permanent occupation.

Near the end of the 9th century, however, the plundering expeditions which emanated from these three sources became so incessant and so widespread that we can signalize no part of west France as free from them, at the same time that the vikings wrought immense mischief in the Rhine country and in Burgundy. The defences of west France seem quite to have broken down, as did the Irish when Turgesius took "Con's half," or when in A.D. 853 Olaf the White became over-king of Ireland. Unfortunately at this point our best authority ceases; and we cannot well explain the changes which brought about the Christianization of the Normans and their settlement in Normandy as vassals, though recalcitrant ones, of the West Frankish kings.

For the viking attacks in the 5th (or 6th) territory, our own country, the course of events is much clearer. As a part of English history it is, however, sufficiently known. The briefest summary thereof must suffice. That will show how in its general features it follows the normal course. The first appearance of the vikings in England we saw was in A.D. 789. The first serious attacks do not begin till 838. The island of Sheppey, however, was attacked in 835, and in the following year the vikings entrenched themselves there. The first wintering of the pirates in England was on the contiguous island of Thanet in A.D. 830. The breakdown of the English defences in all parts of the country save Wessex dates from 868; in Wessex that occurs in 876-88. This is, of course, what is suddenly recovered by Alfred in 878, by the battle of Aethandunum, as suddenly though not so unaccountably as it was later in West Francia. As Rollo was to do in 912, the Danish leader Guthorm received baptism, taking the name of Aethelstane, and settled in his assigned territory, East Anglia, according to the terms of the peace of Wedmore. But the forces which Alfred defeated at Aethandunene represented but half of the viking army in England at the time. The other half under Halfdan (Ragnar Lodbrog's son?) had never troubled itself about Wessex, but had journeyed north, through Norway, to Iona in Italy. The six territories which we have signalized—Ireland, Western Scotland, England, the three in West Francia which merge into each other by the end of the 9th century—do not comprise the whole field of viking raids or attempted invasion. For farther still to the east they twice sailed up the Elbe (A.D. 851, 880) and burnt Hamburg. Southwards they plundered far up the Garonne, and in the north of Spain; and one fleet of them sailed all round Spain, plundering, but attempting in vain to establish themselves in this Arab caliphate. They plundered on the East or African coast, and at last got as far as the mouth of the Rhine. What we found in the case of the Irish raids, that at first they are quite anonymous, but that presently the names of the captains of the expeditions emerge, is likewise the case in all other lands. In Ireland, besides the important and successful Turgesius, we read of a Saxulf who early met his death, as well as of Ivar (Ingvar), famous also in England and called the son of Ragnar Lodbrog, and of Osifa, Ivar's comrade; finally (the vikings in Ireland being mostly of Norse descent) of the well-known Olaf the White, who became king of all the Scandinavian world, both in Norway and Iceland, and the most illustrious and most successful of the invaders. Later the name of Ragnar (probably Ragnar Lodbrog) appears, along with Weland, Hastig and one of the sons of Ragnar, Bjørn. Farther to the east we meet the names of Rurik, Godfried and Siegfried. In the eastern region the viking leaders seem to have been closely connected with one of the Danish royal families, the kings of Jutland. The practical though short-lived conquest of England begins under Ivar, Ubbe and Halfdan, reputed sons of Ragnar, and is completed by the last of the three in conjunction with Sweyn, who doubtless benefitted by the previous changes. We may expect that larger acquaintance gives to the Christian chroniclers more knowledge of their enemy. Precisely the same process in a converse sense develops the casual raids of early times into a scheme of conquest. For at the outset the Christian world was wholly strange to these northernmen. We have, it has been said, hardly any means of viewing these raids from the other side. But one small point of light is so suggestive that it may be cited here. The mythical saga of Ragnar Lodbrog is undoubtedly concerned with the Viking Age, though it is impossible now to identify most of the expeditions attributed to this northern hero, stories of conquest in Sweden, in Finland, in Russia and in England, which belong to quite a different age from this one. In the Christian chronicles the name of Ragnar is associated with an attack on Paris in A.D. 845, when the adventurers were (through the interposition of St Germain, say the Christians) suddenly enveloped in darkness—in a thick fog—and fell before the arms of the defenders. In Saxo Grammaticus' account of Ragnar Lodbrog, this event seems to be reflected in the story of an expedition of Ragnar's to Bjarmeland or Russland. For Bjarmaland, though at first anchored to its old seat in the north, is also in North Norway a wholly mythical and mythological place, more or less identical with the under-world (Nifethel, mist-hell). So it appears in the history given by Saxo Grammaticus of the voyage to Bjarmaland of one "Gorm the old." It "looks like a vaporous cloud" and is full of tricks and illusions of sense. We see then that in virtue of some quite historical misfortune to the viking invaders,
connected with a mist and with a great sickness which invaded the army, the place they have come to (in reality Paris) is in Scandinavian tradition identified with the mythical Bjarnaland; and later, in the history of Saxo Grammaticus, it is identified with the geographical Bjarnaland or Perm. (Saxo Grammat., Hist. Dan., p. 452, Gylfaginning (Edda Snorra); Acta SS. 18th May and 11th Oct.; Steenstrup, Norsmannerne, i. p. 97 seq.; Keary, The Vikings in Western Christendom, pp. 162, 266.)

No example could better than this bring home to us the strangeness of the Christian world to the first adventurers from the north. Ordering them to destroy the Saxon resistance, which gradually extended the sphere of their ambition. The expedition which we have made mention of took place almost in the middle of the 9th century, and exactly fifty years after the effective opening of the Viking Age. But after this date events developed rapidly. It was fourteen years later (in A.D. 859) that Ragnar's son Bjorn Ironside and Hasting made their great expedition round Spain to the Mediterranean. In 865 or 866 came to England what we know as the Army, or the Great Army, whose first attacks were in the north of England. Five kings are mentioned in their ravages on every side in invasion of England and many parts. Their course was not unchequered; but it was only in Wessex that they met with any effective resistance, and the victory of Ashdown (571) put no end to their advance; for, as we know, Alfred himself had at last to wander a fugitive in the fastnesses of Selwood Forest. Much was retrieved by the victory of Aethandune; yet even after the peace of Wedmore as large a part of the land lay under the power of the Danes as of the English.

It is from this time that we discern two distinct tendencies in the Viking people. While one section is ready to settle down and receive territory at the hands of the Christian rulers with or without homage, another section still adheres to a life of mere adventure and of plunder. A large portion of the Great Army refused to be bound by the peace of Wedmore, made some further attempts on England which were frustrated by Alfred's powerful new-built fleet, and then sailed to the continent and spread devastation far and wide. We see them under command of two Danish "kings," Godfred and Siegfried, first in the country of the Rhine-mouth or the Lower Scheldt; afterwards dividing their forces and, while some devastate far into Germany, others extend their ravages on every side in invasion France down to the Loire. The whole of these vast countries, Northern France, with part of Burgundy, and the Rhineland, seem to lie as much at their mercy as England had done before Aethandune, or Ireland before the death of Turgesius. But in every country alike the wave of Viking conquest now begins to recede. The settlement of Normandy was the only permanent outcome of the Viking Age in France. In England under Edward the Elder and Aethelflaed, Mercia recovered a great portion of what had been ceded to the Danes. In Ireland a great expulsion of the invaders took place in the beginning of the 11th century. Eventually the Norsemen in Ireland tented themselves with a small number of colonies, strictly confined in territory around certain seaports which they themselves had created: Dublin, Waterford and Wexford; though as the whole of Ireland was divided into petty kingdoms, it might easily happen that the Norse king in Ireland rose to the position—not much more than nominal—of over-king (Ard-Ri) for the whole land.

Character of the Vikings.—Severe, therefore, as were the viking raids in Europe, and great as was the suffering they inflicted on account of which a special prayer, A ferue Normannorum libera nos, was inserted in some of the litanies of the West—if they had been pirates and nothing more their place in history would be an insignificant one. If they had been no more than what the Illyrian pirates had been in the early history of Rome, or than the Arabic corsairs were at this time in southern Europe, the disappearance of the evil would have been quickly followed by its oblivion. But even at the outset the vikings were more than isolated bands of freebooters. As we have seen, the viking outbreak was probably part of a national movement. We know that at the same time that some Scandinavian folk were harring all the western lands, others were founding Garðarki (Russia) in the east; others were pressing still farther south till they came in contact with the eastern empire in Constantinople, which the northern folk knew as Mikillgarðr (Mikkelegard); so that when Hasting and Bjorn had sailed to Luna in the gulf of Genoa the northern folk had almost put a girdle round the Christian world. There is every evidence that the vikings were not a mere lawless folk—that is, in their internal relations—but that a system of laws and a settled society were working out among them. A special approach to it now preserved is probably the code of laws attributed to the mythical king Frodi (the Wise) and preserved in the pages of Saxo Grammaticus. It contains provisions for the partition of booty, punishments for theft, desertion and treachery. But some of the clauses securing a comparative liberty for women appear less characteristic of the Viking Age (cf. Alexander Bugge, Vikingerne, vol. 1. p. 49). Women, indeed, did not take part in their first expeditions. In the constitution of the Jomborg state and again in that of the eastern Vaering people, women are absent. But, as we see from the next new Empire, we see a constitution which looks like the foretaste of that of the Templars or the Teutonic Knights. Steenstrup thinks the code cited by Saxo may be identical with the laws which Rollo promulgated for his Norman subjects. In any case, they fall more near the Viking period than any other northern table of laws. A certain republicanism was professed by these adventurers. "We have no king," one body answered to some Frankish delegates. We do read frequently of kings in the accounts of their hosts; but their power may not have extended beyond the leadership of the expedition; they may have been princes of rank, but not of a princely spirit. The viking tradition (Teutonic and Scandinavian tradition alike) forbids us to suppose that any would be elected to that office who was not of noble or princely blood. They were not entirely unlettered; for the use of runes dates back considerably earlier than the Viking Age. But these were used almost exclusively for lapidary inscriptions. What we can alone describe as a literature, first the early Eddic verse, next the habit of narrating sagas: these things the Norsemen learned probably from their Celtic subjects, partly in Ireland, partly in the western islands of Britain; certainly a large number of this literature is written on the soil of Iceland. Nevertheless, some of the Eddic songs do seem to give the very form and pressure of the viking period.1

In certain material possessions—those, in fact, belonging to their trade, which was war and naval adventure—these viking folk were ahead of the Christian nations: in shipbuilding, for example. There is certainly a historical connexion between the ships which the tribes on the Baltic possessed in the days of Tacitus and the viking ships (Keary, The Vikings in Western Europe, pp. 185-9): a fact which would lead us to believe that the art of shipbuilding had been better preserved there than elsewhere in northern Europe. Merchant vessels must of course have plied between England and France or Frisia. But it is certain that even Charlemagne possessed no adequate navy, though a late chronicler tells us how he thought of building one. His descendants never carried out his designs. Nor was any English king before Alfred stirred up to undertake the same task. And yet the Romans, when threatened by the Carthaginian power, built in one year a fleet capable of holding its own against the, till then, greatest maritime nation in the world. The viking ships had a character apart. They may have owed their origin to the Roman sail-makers: they did without doubt owe their sails to them.2 Equally certain is it that this special type of shipbuilding was developed in the Baltic, if not before

---

1 More especially the beautiful series contained in book iii. of the Corpus Poeticum Boreale, and ascribed by the editors of that collection to one poet—"the Helgi Poet." Here vikings are mentioned by name—e.g., Varðr ór ok larna glymr; brast rönd við rönd; rero vikingar.

2 "Sail," in every Teutonic language is practically the same word, and derived from the Latin sagulum.

5 XVIII. 3
VIKRAMADITYA—VILAS

the time of Tacitus, long before the dawn of the Viking Age. Their structure is adapted to short voyages in a sea well studded with harbours, not exposed to the most violent storms or most dangerous tides. To the last, judging by the specimens of Scandinavian boats which have come down to us, they must have been not very seaworthy; they were shallow, narrow in the beam, pointed at both ends, and so eminently suitable for manoeuvring (with oars) in creeks and bays. The Viking ship had but one large and heavy square sail. When a naval battle was in progress, it would depend for its manoeuvring on the rowers. The accounts of naval battles in the sagas show us, too, that this was the case. The rowers in each vessel, the stouter men, generally manned the northern side of it, and there were also many of the most warlike warriors, not slaves as in the Roman and Carthaginian gallogal, would yet need to be supplemented by a contingent of fighting men, marines, in addition to their crew. Naturally the ship-building developed: so that vessels in the Viking age would be much smaller than in the Saga Age. In saga literature we read of craft (of "long ships") with 20 to 30 benches of rowers, which would mean 40 to 60 oars. There exist at the museum in Christiania the remains of two boats which we found in the neighbourhood: one, the Gokstad ship, is in very tolerable preservation. It belongs probably to the 11th century, or to the north of that district, but there are two or three oars a side. It is not probable that the largest Viking ships had more than 10 oars a side. As these ships must often, against a contrary wind, have had to row both day and night, it seems reasonable to imagine the crew divided into three shifts (as they call them in mining districts), which would give double the number of men available to fight on any occasion as to row. Thus a 20-oared vessel would carry 60 men. But some 40 men per ship seems, for this period, nearer the average. In 896, toward the end of our age, it is incidentally mentioned in one piece of a dramatized account of the battle of Hafrsfjord, that there were 40 ships, an average of 40 per ship. Elsewhere about the same time we read of 12,000 men carried in 250 ships, an average of 48.

The round and painted shields of the warriors hung outside along the bulwarks: the vessel was steered by an oar at the right side (as whaling boats are to-day), the steerboard or starboard side. Prow and stern rose high; and the former was carved most often into the likeness of a snake's or a dragon's head: so generally that "dragon" or "worm" (snake) became synonymous with a war-ship. The warriors were well armed. The byrnie or mail-shirt is often mentioned in Eddic songs: so are the axe, the spear, the bow and arrows and the sword. The Danes were specially renowned for their axes; but about the sword the most of northern poetry and mythology clings. An immense joy in battle breathes through the earliest Norse literature, which has scarce its like in any other literature; and we know that the language recognized a peculiar battle fury, a veritable madness by which certain were seized and which went by the name of "berserk's way" (berserkganger). The courage of the Vikings was proof against anything, even as a rule against superstitious terrors. "We cannot easily realize how all-embracing that courage was. A trained soldier is often afraid at sea, a trained sailor lost if he has not the protecting sense of his own ship beneath him. The Viking ventured upon unknown waters in ships very ill-fitted for their work. He had all the spirit of adventure of a Drake or a Hawkins, all the trained valour of reliance upon his comrades that mark a soldierly fighting a militia" (The Vikings in Western Christendom, p. 143). He was unfortunately hardly less marked for cruelty and faithlessness. Livy's words, "inhumana crudelitas, perfidia plus quam Punica," might, it is to be feared, have been applied justly to the Vikings as to any people of western Europe. It is also true, however, that the showe a great capacity for government, and in times of peace for peaceful organization. Normandy was the best-governed part of France in the 11th century; and the Danes in East Anglia and the Five Burgs were in many regards a model to their Saxon neighbours (Steensstrup, op. cit. iv. ch. 2). Of all European lands England is without doubt that on which the Viking Age has left most impression: in the number of original settlers after 878; in the way which these prepared for Canute's conquest; and finally in that which she absorbed from the conquering Normans. England's gain was France's loss: had the Normans turned their attention in the other direction, they might likely have broken the last efforts of the Merovingian kings, and saved that country from the intermittent anarchy from which it suffered from the 11th till the middle of the 15th century.

Sources of Viking History.—These are, as has been said, almost exclusively the chronicles of the lands visited by the Vikings. For Ireland we have, as on the whole our best authority, the Annales Ulfanenses (C. O'Connor, Scr. Rev. Hib., iv.), supplemented by the Annales of the Four Masters (ed. O'Donovan) and the Chronicorum Scotorum (ed. Hennessy). Finally, The War of the Gaedhil with the Gaill (ed. Todd); Three Fragments of Irish History (O'Donovan); Smith, History of the Vikings; Harmsworth's History of the Nations; Gaill's Chronicle, Annales Lindisfarrense (in Persz, Monumenta, vol. xii.); Simeon of Durham, Historia Dunelmii Ecclesiast. For the Frankish empire the chief sources of our information are The Annales Regni Franci and the Annales Bertiniani, Worsaae, Annales Bertiniani (Persz, vol. ii.), the authorities for the northern and eastern regions, and the Annales Fuldenses (which begin with Pipan of Herve, are divided down to A.D. 900; Persz, vol. i.) for Germany. Toward the end of the 9th century the Annales Vedastini (Persz, vol. i. and ii.) are almost the exclusive authority for the western raids. In the historians of Normandy, especially in Dudo of St Quentin, much incidental matter may be found.

References to the Viking Age in a general way are to be found in a large number of books, especially histories of the Scandinavian countries, of which Munch's Det Norrøne Folks Historie (1852, &c.) is the most distinguished: J. J. A. Worsaae has written Minder om Danes og Nord-Mandene i England, Skotland og Irelanden (1883), an antiquarian rather than an historical study; C. G. Deppen, L'Histoire des expéditions maritimes des Normands (1843), a not very critical work, and E. Mahille, Les Invasions Normandes dans la Loire (1885). A. Worsaae has prepared a very complete set of books, The Vikings in Western Christendom (1904-6), in four volumes, is not without much historical value; and the work of R. H. Pertz, Persz, is an antiquarian rather than an historical study; Pertz, vol. ii., still on on the most northern side of the Vikings, or, one should rather say, of the earliest Scandinavian folk.

VIKRAMADITYA, a legendary Hindu king of Ujkain, who is supposed to have given his name to the Vikram Samvat, the era which is used all over northern India, except in Bengal, and at whose court the "nine gems" of Sanskrit literature are also supposed to have flourished. The Vikram era is reckoned from the vernal equinox of the year 57 B.C., but there is no evidence that that date corresponds with any event in the life of a king or a group of kings, and all dates in this era down to the roth century never use the word Vikram, but that of Malava instead, that being the tribe that gives its name to Malwa. The name Vikramaditya simply means "sun of power," and was adopted by several Hindu kings, of whom Chandragupta II. (Chandragupta Vikramaditya), who ascended the throne of the Gupta Empire over A.D. 375, approaches most nearly to the legend.

See Alexander Cunningham, Book of Indian Races (1883); and Worsaae, Smith, and Persz, Annales Bertiniani, ii. 1885.

VILAS, WILLIAM FREEMAN (1840-1908), American political leader and lawyer, was born in Chelsea, Vermont, on the 9th of July 1840. His father, Levi B. Vilas, a lawyer and Democratic politician, emigrated in 1853 to Madison, Wisconsin, William graduated at the university of Wisconsin in 1858, and at the Albany (New York) Law School in 1860, and began to practise law in Madison with his father. In 1862 he recruited and became captain of Company A of the Twenty-Third Wisconsin
Volunteers, of which he was made lieutenant-colonel in 1863, and which he commanded in the siege of Vicksburg. In August 1863 he resigned his commission and resumed his law practice. He was professor of law in the university of Wisconsin in 1868-85, and again in 1889-92, and in 1875-78 was a member of the commission which revised the statutes of Wisconsin. From 1876 to 1886 he was a member of the National Democratic Committee, and virtually the leader of his party in his state; he was a delegate to the National Democratic Conventions of 1876, 1880 and 1884, and was permanent chairman of the last. In 1885 he was a member of the state Assembly. He was postmaster-general in President Grover Cleveland's cabinet from March 1885 until January 1888, and was then secretary of the interior until March 1889. From 1891 until 1897 he was a member of the United States Senate, in which, during President Cleveland's second term, he was recognized as the chief defender of the Administration, and he was especially active in securing the repeal of the silver-purchase clause of the Sherman Act. He was a delegate to the Democratic National Convention of 1896, but withdrew after the adoption of the free-silver plank. He then became one of the chief organizers of the National (or Gold) Democratic party, attended the convention at Indianapolis, and was chairman of its committee on resolutions. In 1881-85 and in 1898-1905 he was a regent of the university of Wisconsin; and he was a member (1897-1903) of the commission which had charge of the erection of the State Historical Library at Madison. In 1896-98 of the commission for the construction of the new state capital. He died at Madison on the 27th of August 1908.

With E. E. Bryant he edited vols. i. to xx., except vol. v., of the Report of the Wisconsin Supreme Court.

VILL, the Anglicized form of the word villa, used in Latin documents to translate the Anglo-Saxon tun, township, "the unit of the constitutional machinery, the simplest form of social organization" (Stubbs, Const. Hist. § 39). The word did not always and at all times have this meaning in Latin-English documents, but "villa" and "township" were ultimately, in English law, treated as convertible terms for describing a village community, and they remained in use in legal nomenclature until the ecclesiastical parishes were converted into areas for civil administration under the Poor Law Acts. This technical sense is derived from the late Latin use of villa for vicus, a village. Thus Flæts (vi. c. 51), writing in the time of Edward I., distinguishes the villa, as a collection of habitations and their appurtenances, from the manor, a single house, nulì vicina, and the manor, which may embrace one or more villæ. In classical Latin villa had meant "country-house," "farm," "villa" (see Villa); but the word was probably an abbreviation of vîcula, diminutive of vicus, and in the sense of vicus it is used by Apuleius in the 2nd century. Later it even displaced civitas, for city; thus Rutulii Nama-
tianus in his Itinerarium speaks of villæ insigntes, oppida parva; whence the French ville (see Du Cange, Glossarium lat. s.v. Villa). In the Frankish empire villa was also used of the royal and imperial palaces or seats with their appurtenances. In the sense of a small collection of habitations the word came into general use in England in the French form "village." From "villa," too, are derived villain and villenage (q.v.) (see also Village Communities).

VILLA, the Latin word (diminutive of vicus, a village) for a country-house. This term, which in England is usually given to a small country-house detached or semi-detached in the vicinity of a large town, is being gradually superseded by such expressions as "country" or "suburban house," "bungalow," &c., but in Italy it is still retained as in Roman times and means a summer residence, sometimes being of great extent. References to the villa are constantly made by Roman writers. Ciceró is said to have possessed no less than seven villas, the oldest of which was near Arpinum, which he inherited. Pliny the younger had three or four, of which the example near Laurentium is the best known from his descriptions.

There is too wide a divergence in the various conjectural restorations to make them of much value, but the remains of the villa of Hadrian at Tivoli, which covered an area over seven miles long and in which reproductions were made of all the most celebrated buildings he had seen during his travels, those in Greece seeming to have had the most attraction for him, and the villas of the 16th century on similar sites, such as the Villa d'Estè near Tivoli, enable one to form some idea of the exceptional beauty of the positions selected and of the splendour of the structures which enriched them. According to Pliny, there were two kinds of villas, the villa urbana, which was a country seat, and the villa rustica, the farm-house, occupied by the servants who had charge generally of the estate. The Villa Boscoreale near Pompeii, which was excavated in 1803-94, was an example of the villa rustica, in which the principal room was the kitchen, with the bakery and stables beyond and room for the wine presses, oil presses, horse stables, &c. The villas near Rome were all built on hilly sites, so that the laying out of the ground in terraces formed a very important element in their design, and this forms the chief attraction of the Italian villas of the 16th century, among which the following are the best known: the Villa Madama, the design of which, attributed to Raphael, was carried out by Giulio Romano in 1520; the Villa Medici (1540); the Villa Albani, near the Porta Salaria; the Borghese; the Doria Pamphilj (1650); the Villa di Papa Giulio (1550), designed by Vignola; the Aldobrandini (1593); the Farnesini and the Montdragon (1640); and the Villa d'Este near Tivoli in which the terraces and staircases are of great importance. In the proximity of other towns in Italy there are numerous villas, of which the example best known is that of the Villa Rotunda or Capra near Vicenza, which was copied by Lord Burlington in his house at Chiswick.

The Italian villas of the 16th and 17th century, like those of Roman times, included not only the country residence, but the whole of the other buildings on the estate, such as bridges, casinos, pavilions, small temples, rectangular or circular, which were utilized as summer-houses, and which seem to have had a certain influence in England, which may account for the numerous examples in the large parks in England of similar erections, as also the laying out of terraces, grottos and formal gardens. In France the same influence was felt, and at Fontainebleau, Versailles, Meudon and other royal palaces, the celebrated Le Nôtre transformed the parks surrounding them and introduced the cascades, which in Italy are so important a feature, as at St Cloud near Paris.

(R. P. S.)

VILLACH, a town in Carinthia, Austria, 24 m. W. of Klagen-furt by rail. Pop. (1900) 13,608. It is situated near the Drave, near its confluence with the Gail, in a broad fertile basin at the foot of the Dobratsch or Villach Alp (3107 ft.). The parish church is an interesting Gothic edifice of the 15th century. The principal industry of Villach consists in the fabrication of various lead wares, and is mostly dependent on the lead mines of Bleiberg, which is situated about 9 m. to the west. This village (pop. 3435) is one of the richest lead-mining centres in Europe. The ores found here comprise silver-free galena, sulphate of zinc and calamine. The mines were already worked during the middle ages. Warmbad Villach, a watering-place with hot sulphur baths, and Mittweid, a favourite summer resort, where the ascent of the Dobratsch can be made, are in the neighbour-

hood of Villach. Some of the prettiest Carinthian lakes are to be found near Villach, as the Ossiacher-see, on whose southern shore stands the ruined castle of Landskron, dating from the middle of the 16th century, the Wörther-see and the small but lovely Faaker-see.

Villach is an old town, which was given by Heinrich II. to the bishopric of Bamberg in 1007. During the middle ages it was an important centre of commerce between Germany and Italy. With the advent of new trade routes at the beginning of modern times the town lost its importance, and in 1745 the citizens nearly decided to emigrate en masse. Its trade revived during the French occupation of 1809-13, and it
continued to improve during the 19th century. The Turks were defeated here in 1492 by Maximilian I, and an engagement between the Austrians and the French took place here on the 21st of August 1873.

VILLA DEL PILAR, a city of Paraguay, 104 m. S. by E. of Asuncion, on the left bank of the navigable river Paraguay, which receives the Bermejo from the right immediately opposite. Pop. (1910) about 10,000. Villa del Pilar is a thriving modern city, containing barracks, law courts, a national college, several schools and a branch of the Agricultural Bank. It has a fine harbour, and is one of the principal centres in the republic for the exportation of oranges.

VILLAFRANCA DI VERONA, a town of Venetia, Italy, in the province of Verona, 11 m. S.S.W. of Verona, on the railway to Mantua, 174 ft. above sea-level. Pop. (1901) 5057 (town); 9635 (commune). It has considerable silk industries. Here preliminaries of peace were signed between Napoleon III. and the Austrians in 1859 after the battle of Solferino. Five miles to the N. is Custozza, where the Italians were defeated by the Austrians in 1848 and 1866. Villafranca is a common place name in Italy.

Village Communities. The study of village communities has become one of the fundamental methods of discussing the ancient history of institutions. It would be out of the question here to range over the whole field of human society in search for communal arrangements of rural life. It will be sufficient to confine the present inquiry to the varieties presented by nations of Nordic stock, for the subject is here only to be attached to these nations than to other branches of humankind, although this view might also be reasonably urged, but principally because the Aryan race in its history has gone through all sorts of experiences, and the data gathered from its historical life can be tolerably well ascertained. Should the road be sufficiently cleared in this particular direction, it will not be difficult to connect the results with similar researches in other racial surroundings.

The best way seems to be to select some typical examples, chiefly from the domain of Celtic, Slavonic and Germanic social history, and try to interpret them in regard to the general conditions in which communal institutions originate, grow and decay. As the principal problem will consist in ascertaining how far land was held in common instead of being held, as is usual at present, by individuals, it is advisable to look out for instances in which this element of holding in common is very clearly expressed. We ought to get, as it were, acclimated to the mental atmosphere of such social arrangements in order to counteract a very natural but most pernicious bent in the human mind to apply to the modern view of the matter of any existence of the communal conditions as a provincial and habitational notion. A certain acquaintance with the structure of Celtic society, more especially the society of ancient Wales, is likely to make it clear from the outset to what extent the husbandry and law of an Aryan race may depend on institutions in which the individual factor is greatly reduced, while the union first of kinsmen and then of neighbours plays a most decisive part.

F. Seebohm has called our attention to the interesting surveys of Welsh tracts of country made in the 14th century, soon after these regions passed into the hands of the English lords. Some fragments from memoirs of these surveys published by him and his contributors on them are very illuminating, but further study of the documents themselves discloses many important details and helps to correct some theories propounded on the subject. Let us take up a concrete and simple case, e.g. the description of Astret Canon, a trev or township (villata) of the honour of Denbigh, surveyed in 1334. In the time of the native Welsh princes it was occupied entirely by a kindred (progenies) of free tribesmen descended from a certain Canon, the son of Llauwarch. The kindred was subdivided into four gavells or bodies of joint tenancy. On the half-gavell of Monton, Cynon Canon, e.g., there were no less than sixteen coparceners, of whom eight possess houses. The peculiarity of this system of land tenure consists in the fact that all the tenants of these gavells derive their position on the land from the occupation of the township by their kindred, and have to trace their rights to shares in the original unit. Although the village of Astret Canon was occupied under the Survey by something like fifty-four male tenants; the majority of whom were settled in houses of their own, it continued to form a unit as well in regard to the payment of tungspond, that is, of the direct land tax and other services and payments, but also in respect of the possession and usage of the soil. On the other hand, movable property is owned in severally. Services have to be apportioned among the members of the kindreds according to the number of heads of cattle owned by them. From the description of another township—Pireyon—

we may gather another important feature of this tribal tenure. The population of this village also clustered in gavells, and we hear that these gavells ought to be considered as equal shares in respect of the arable, the wood and the waste of the township. If the shares were reduced into acres there would have fallen to each of the eight gavells of Pireyon ninety-one acres, one rood and a half and six perches of arable and woodland, and fifty-three and one-third of an acre and half a rood of waste land. But as a matter of fact the land was not divided in such a way, and the rights of the tenants of the gavell were realized not through the appropriation of definite acres, but as proportionate opportunities in regard to tillage and to usages in pasture, wood and waste. Pastoral habits must have greatly contributed to give the system of landholding its peculiar character. It was not necessary, it would have been even disadvantageous, if in the centre of the area which was here, the cows and the flocks of sheep and goats were grazing. Stil Welsh rural life in the 14th century had already a definite though subordinate agricultural aspect, and it is important to notice that individual appropriation had as yet made very slight progress in it.

We do not notice any systematic equalization between members of the tribal communities of the trevs. In fact, both differences in the ownership of cattle and differences of tribal standing, established by complex reckonings of pedigree and of social rank, led to marked inequalities. But there was also the notion of birthright, and we find in the laws that every free tribesman considered himself entitled to claim from his kindred grazing facilities and five erws for tillage. Such a claim could be made unconditionally only at a time when there was a superabundance of land to dispose of. In the 14th century, to which our typical descriptions refer, this state of things had ceased to be universal. Although great tracts of Welsh land were undoubtedly still in a state of wilderness, the soil in more conveniently situated regions was beginning to be scarcer, and considerable pressure of population was already felt, with a consequent transition from pastoral pursuits to agriculture. The tract appropriated to the township of Astret Canon, for instance, contained only 574 acres of land of all kinds. In this case there was hardly room for the customary five erws per head of grown-up males besides commons. And yet although the population lived on a small pittance, the system of tribal tenure was not abandoned.

Although there are no rearrangements or redistribution within the tribe as a whole, inside every gavell, representing more narrow circles of kinsmen, usually descendants of a kindred, i.e. an individual, the shares were shifted and readjusted according to one of two systems. In one case, that of the treycyrrv or joint-account village, every man receives "as much as another yet not of equal value"—which means, of course, that the members of such communities were provided with equal allotments, but left to make the best of them, each according to chance and ability. This practice of reallocation was, however, restricted in the 14th century to taeg trevs, to villages occupied by half-free settlers. The free tribesmen, the pridori of Wales, held by doddenwed, and redivided shares within the trev on the coming of each new generation or, conversely, on the going out, the dying out, of each older generation. In other words: at the demise of the last of the grandfathers in a gavell, all the fathers took
equal rank and claimed equal shares, although formerly some of the portions had been distributed equally only between the grandfather's or their offspring (stirs). The right to claim redivision held good only within the circle of second cousins. Members of the kindred who stood further than that from each other, that is, third cousins, were not entitled to reallotment on the strength of daddemoud.

Another fact which is brought out with complete evidence by the Welsh Surveys is that the tenure is ascribed to communities of kinsmen and not to chiefs or headmen. The latter certainly existed and had exerted a powerful influence on the disposal of common land as well as on government and justice. But in the view of 14th-century surveys each township is owned not by this or the other elder, but by numerous bodies of coparceners. The gavell of Owen Gogh, for instance, contained twenty-six coparceners. In this way there is a clear attribution of rights of communal ownership, if we like to use the term, and not merely of rights of maintenance. Not is there any warrant for a construction of these arrangements on a supposed patriarchal system.

Let us now compare this description of Celtic tribal tenure with Slavonic institutions. The most striking modern examples of tribal communities settled on a territorial basis are presented by the history of the Southern Slavs in the Balkan Peninsula and in Austria, of Slovones, Croats, Serbs and Hungarians, but it is to trace customs of the same kind in the memories of Western Slavs conquered by Germans, of the Poles and of the different subdivisions of the Russians. A close clue to this subject is provided by a case of the Galatians, which shows that a man by himself is bound to be a bretstvo. One might almost suggest that these popular customs illustrate the Aristotelian conception of the single man seeking the "autarkia," a complete and self-sufficient existence in the society of his fellow-men, and arriving at the stage of the tribal village, the "gêmos," which is also a "kôyem," as described in the famous introductory chapter of the Greek philosopher's Politics. The Slavs of the mountainous regions of the Balkans and of the Alps in their stubborn struggle with nature and with human enemies have clustered and still clung to some extent (e.g., in Montenegro) in closely united and widely spreading brotherhoods (bretstvo) and tribes (plemena). Some of these brotherhoods derive their names from a real or supposed common ancestor, and are composed of relatives as well as of affiliated strangers. They number sometimes hundreds of members,1 of guns, as the fighting males are characteristically called. Such are—the Vukotiči, Kovačevići, as one might say in Old English—the Vukotings or Kovachevings, of Montenegro. The dwellings, fields, and pasturages of these brotherhoods or kindreds are scattered over the country, and it is not always possible to trace them in compact divisions on the map. But there was the closest union in war, revenge, funeral rites, marriage arrangements, provision for the poor and for those who stand in need of special help, as, for instance, in case of fires, inundations and the like. And corresponding to this union there existed a strong feeling of unity in regard to property, especially property in land. Although ownership was divided among the different families, a kind of superior or eminent domain stretched over the whole of the bretstvo, and was expressed in the participation in common in pasture and wood, in the right to control alienations of land and to exercise pre-emption. If any of the members of the brotherhood wanted to get rid of his share he had to apply first to his next of kin within the family and then to the further kinsmen of the bretstvo.

As the Welsh kindred (progenies) were subdivided into gavells formed of extended family communities, even so the Bosnian, Montenegrian, Servian, Slovone tribes fell into house communities, Kucias, Zodrugias, which were built up on the principle of keeping blood-relatives and their property together as long as possible. They consisted generally of some 15 to 20 grown-up persons, some 6 or 7 first and second cousins with their wives and children, living in a hamlet around the central house of the domatin, the house leader. In some instances the number of coparceners increased to 50 or even to 70. The members of the united house community, which in fact is a small village or hamlet, joined in meals and work. Their rights in the undivided household of the hamlet were apportioned according to the pedigree, i.e. this apportionment took account first of the stirs of exact descendents of former scions of the family, so that, say, the offspring of each of two grandfathers who had been brothers were considered as equal sharers although the stirs, the stock, of one was represented only by one person, while the stirs of the other had grown to consist of two uncles and of three nephews all alive. There was no resettlement of shares, as in the case of Wales, but the life of the house community while it existed unbroken led to work in common, the contributions to which are regulated by common consent and supervised by the leader. Grounds, houses, implements of agriculture (ploughs, oxen, carts) and of viniculture—vasks, cauldrons for the making of brandy, &c., are considered to be common capital and ought not to be sold unless by common consent. Divisions were not prohibited. Naturally a family had to divide sooner or later, and the shares have to be made real, to be converted into fields and vineyards. But this was an event which marks, as it were, the close of the regular existence of one union and the birth of similar unions derived from it. As a rule, the kucas kept together as long as it could, because co-operation was needed and isolation dangerous—for economic considerations as well as for the sake of defence.

Attention, however, should be called more particularly to the parallel phenomena in the social history of the Russians, where the conditions seem to stand out in specially strong contrast with those prevailing among the mountain Slavs of the Balkans and of the Alps. In the enormous extent of Russia we have to reckon with widely different geographical and racial areas, among other, with the Steppe settlements of the so-called Little Russians in the Ukraine and the forest settlements of the Great Russians in the north. In spite of great divergencies the economic history of all these branches of Slavonic stock gravitates towards one main type, viz. towards rural unions of kinsmen, on the basis of enlarged households. In the south the typical village settlement is the dvorîše, the big court or hamlet consisting of some four to eight related families holding together; in the north it is the petlîše, the big oven, a hamlet of somewhat smaller size in which three to five families are closely united for purposes of common husbandry.

It is interesting to notice that even the break-up of the joint household does not lead to an entire severance of the ties between its members. They mostly continue in another form, viz. in the shape of an open-field system with mixture of strips, and also to a certain extent against ever past and of wood, sometimes shifting allotments as regards meadows. There is, e.g. an act of division between six brothers from the north of Russia of the year 1640. They agree to divide bread and salt, house and liberties, money, cloth and stores of all kinds and to settle apart. As to arable, Shumila is to take the upper strip in the field by the settlement, and next to him Tretjak, then Maxim, then Zaviala, then Shestoï, then Lukë. In the big harvest furlong likewise, and in the small likewise, and by the meadow likewise and so on through all the furlongs. So that in this case and in innumerable others of the same kind the open-field system with its inconvenient intermixture of plots and limited power of every husbandman to manage his land appears as a direct continuation of the joint tribal households.

Another fact to be noticed is the tendency to form artificial associations on the pattern of the prevailing unions of kinsmen. People who have no blood-relations to appeal to for clearing the waste, for providing the necessary capital in the way of cattle and plough implements, for raising and fitting out buildings, join in order to carry on these economic undertakings, and also to help each other against enemies and aggressors. The members of these voluntary associations,
which at once call to mind German, Norse and English gilds, are called "siabri," "skladiński," and the gilds themselves "spółki," in south Russia. In a district of the Ukraine called the "Ratenšky Sharostvo" there were no fewer than 278 such gilds interchanging with natural kindreds. The organization of all independence of kindred was not the custom. Even in cases when there is a definite elder or headman (bolshoy), he was only the first among equals and exercised only a limited authority over his fellows: all the important decisions had to be taken by the council of the community.

In Great Russia, in the districts gathered under the sway of the Moscow tsars, the basis of the household community and of the rural settlements which sprang from it was modified in another direction. The entire agricultural population was subjected to strict supervision and coercive measures for purposes of military organization and taxation. Society was drilled into uniformity and service on the principle that every man has to serve the tsar, the upper class in war and civil administration, the lower class by agricultural labour. A consequence of the heavy burden laid on the land and of the growth of a landed aristocracy somewhat resembling the gentry and the noblesse of the West was a change in the management of land allotments. They became as much a badge of service and a basis for fiscal requirements as a means of livelihood.

The result was the practice of reallocations according to the needs of different families. The shifting of fertile and infertile (peredelok) tracts was not the reappropriation of rights, but a consequence of the correspondence between rights and obligations. But although this admixture of claims appears as a comparatively recent growth of the system, the fundamental solidarity by kinsmen or neighbours associates grouped into villages was in no way an invention of the tsars or of their officials: it was rooted in traditional customs and naturally suggested by the practices of joint households. When these households become crowded in certain areas, open-field systems arise; when they are burdened with public and private service their close co-operation produces occasional or periodical redivisions of the soil between the shareholding.

Let us now pass to village communities in Teutonic countries, including England. A convenient starting-point is afforded by the social and economic conditions of the southern part of Jutland.

Now the Saxon or Ditmarschen portion of this region gives us an opportunity of observing the effects of an extended and highly systematized tribal organization on Germanic soil. The Saxon kindred is named after the family groupings which reminds one of the Swiss cantons, lasted until the time of the Reformation. We find the Ditmarschen organized in the 11th, as they had been in the 10th century, in a number of large kindreds, partly composed of relatives by blood and partly of "cousins" who had joined them. The membership of these kindreds is based on agnatic ties—that is, on relationship through males—or on affiliation as a substitute for such agnatic kinship. The families or households are grouped into brotherhoods, and these again into clans or "Schlachten" (Geschlechter), corresponding to Roman gentes. Some of them could put as many as 8,000 warriors in the field. They took their names from ancestors and chieftains: the Wollersmannen, Hennekommnen, Jerremannen, &c.—that is, the men of Woll, the men of Henne, the men of Jerre. In spite of these personal names the organization of the clans was by no means a monarchical one: it was based on the participation of the full-grown fighting men in the government of each clan and on a council of co-opted elders at the head of the entire federation. We need not repeat here what has already been stated about the mutual support which such clans afforded to their members in war and wisdom, in judicial and in commercial matters.

Let us notice the influence of this tribal organization on husbandry and property. The regular economic arrangement was an open-field one based on a three-field and similar systems. The furlongs were divided into intermixed strips with compulsory rotation on the usual pattern. And it is interesting to notice that in these economic surroundings indivisible holdings corresponding to the organic units required for efficient agriculture arose of themselves. In spite of the equal right of all coheirs to an estate, this estate does not get divided according to their numbers, but either partition of divided or else falls into such fractions, halves or fourths, which will enable the farming to be carried on successfully, without mischievous interruption and disruption. Gradually the people settled down into the custom of united succession for agrarian units.

The Hufe or Hof, the virgate, as might have been said in England, goes mostly to the eldest son, but also sometimes to the youngest, while the brothers of the heir either remain in the same household with him, generally unmarried, or leave the house after having settled with the heir, who takes charge of the holding, as to an indemnity for their relinquished claims. This indemnity is not equivalent to the market price, but is fixed, in case of dispute or doubt, by an award of impartial and expert neighbours, who have to consider not only the claims of interested persons but also the economic quality and strength of the holding. In other words, the heir has to pay so much as the estate can conveniently provide without being wrecked by the outlay.

This evidence is of decisive importance in regard to the formation of unified holdings; we are on entirely free soil, with no vestige whatever of manorial or communal origin remaining. The tenant by the lord, and yet the Hufe, the normal holding, comes to the fore as a result of the economic situation, on the strength of considerations drawn from the efficiency of the farming. This "Anerben" system is widely spread all through Germany. The question whether the eldest or the youngest succeeds is a subordinate one. Anyhow, manorial authority is not necessary to produce the limitation of the rights of succession to land and the creation of the system of holdings, although this has been often asserted, and one of the arguments for a servile origin of village communities turns on a supposed incompatibility between unified succession and the equal rights of free coheirs.

We need not speak at any length about other parts of Germany, as space does not permit of a description of the innumerable combinations of communal and individual elements in German law, the various shapes of manorial and political institutions with which the influence of blood relationship, gild and neighbourly union had to struggle.

But we must point out some facts from the range of Scandinavian customs. In the mountainous districts of Norway we find the same representation of the different generations as in the plains and hills of Schleswig and Holstein. The border of Gudbrandsdalen and Telemarken, the free peasantry tilling the soil and pasturing herds on the slopes of the hills since the days of Harold Hárfagri to our own times, sit in Odalgaards, or freehold estates, from which supernumerary heirs are removed on receiving some indemnity, and which are protected from alienation into strange hands by the privilege of pre-emption exercised by relatives of the seller. Equally suggestive are some facts on the Danish side of the Straits, viz. the arrangements of the bøls which correspond to the virgates of England and to the Hufen of Germany. Here again we have to do with normal holdings independent of the number of coheirs, but dependent on the requirements of agriculture—on the plough and oxen, on certain constant relations between the arable of an estate and its outlying commons, meadows and woods. The bøl does not stand by itself like the Norwegian gaard, but is fitted into a very close union with neighbouring bøls of the same kind. Practices of corosation, of open-field intermixture, of compulsory rotation of lot-meadows, of stinting the commons, arise of themselves in the villages of the ancient bøls, but based on even more ancient customs give us most interesting and definite information as to Scandinavian practices of allotment.

We catch a glimpse, to begin with, of a method of dividing
VILLAGE COMMUNITIES

fields which was considered archaic even in those early times. The Swedish laws use the expression "forniskft," which means ancient mode of allotment, and another term corresponding to it is "hamariskft," which may possibly be connected with throwing the hammer in order to mark the boundary of land occupied by a man's strength. The two principal features of forn or hamar skift are the irregularity of the resulting shapes of plots and the temporary character of their occupation. The first observation may be substantiated by a description like that of Laasby in Jutland: "These lands are to that extent scattered and intermixed by the joint owners that it cannot be said for certain what (or how much) they are." Swedish allotments, on the other hand, speak expressly of practices of shifting arable and meadows periodically; sometimes year by year.

Now the uncertainty of these practices based on occupation became in process of time a most inconvenient feature of the situation and evidently led to constant wrangling as to rights and boundaries. The description of Laasby which I have just quoted ends with the significant remark: "They should be compelled to make allotment by the cord." This making of allotments by the cord is the process of redivision, from 

The two fundamental positions from which this form of allotment proceeds are: (1) that the whole area of the village is common land (fællesjord), which has to be lotted out to the single householders; (2) that the partition should result in the creation of equal holdings of normal size (bøls). In some cases we can actually recognize the effect of these allotments by ancient solskift in the 18th century, at a time when the Danish enclosure acts produced a second general revolution in land-handling.

The oldest twelve inhabitants, elected as sworn arbitrators for effecting the allotments, begin their work by throwing together into one mass all the grounds owned by the members of the community, including dwellings and farm-buildings, with the exception of some privileged plots. There is a close correspondence between the sites of houses and the shares in the field. The first operation of the surveyors consists in marking out a village green for the night-rest and pasture of the cattle employed in the tillage (jord), and to assign sites to the tenants of the coparceners with orchards appendant to their hold (toft); each householder having the exactly the same extent of land as his neighbour. From the tofts they proceeded to the fields on the customary notion that the toft is the mother of the field. The fields are disposed into furlongs and shots, as they were called in England, and divided among the members of the village with the strictest possible equality. This is effected by assigning to every householder a strip in every one of the furlongs constituting the arable of the village. Meadows were often treated as lot-meadows in the same way as in England. According to the account of a solskift executed in 1513 (Oester Hoesisted), every ething, the eighth part of a bolt (corresponding to the English oxgang or bovate), got a toft of 40 roods in length and 6 in breadth. One of the coparceners received, however, 8 roods because his land was worse than that of his neighbours. Of the arable there were allotted to each otting two roods' breadth for the plough in each furlong and appendant commons "in damp and in dry" — in meadow and pasture. After such a "solskift" the peasants held their tenements in undisturbed ownership, but the eminent demesne of the village was recognized and a revision of the allotment was possible. When such revisions did actually take place, and in such cases all rights and claims were proportioned according to the standard of the original shares. Needless to say that these shares were subjected to all the usual limitations of champion farming.

After having said so much about different types of village communities which occur in Europe it will be easier to analyse the incidents of English land tenure which disclose the working of similar conceptions and arrangements. Features which have been very prominent in the case of the Welsh, Slavs, Germans or Scandinavians recur in the English instances sometimes with equal force and at other times in a mitigated state.

There are some vestiges of the purely tribal form of community on English soil. Many of the place-names of early Saxon and Anglican settlements are derived from personal names with the suffix ing, as designations like Oakington, the town of the Hockings.

True, it is just possible to explain some of these place-names as pointing to settlements belonging to some great man and therefore taking their designation from him with the adjunct of an ing indicating possession. But the group of words in question falls in exactly with the common patrimonies of Saxon and German families and kindreds, and therefore it is most probable, as Kemble supposed, that we have to do in most of these instances with tribal and family settlements, although the mere fact of belonging to a great landowner or a monastery may have been at the root of some cases.

A very noticeable consequence of tribal habits in regard to landownership is presented by the difficulties which stood in the way of alienation of land by the occupiers of it. The Old English legal system did not originally admit of any alienation of folkland, land held by folkright, or, in other words, of the land owned by the members of the tribe, and this law of the people. Such land could not be bequeathed out of the kindred and could not be sold without the consent of the kinsmen. Such complete disabilities could not be upheld indefinitely, however, in a growing and progressive community, and we find the ancient folkright assailed from different points of view. The Church insists on the right of individual possessors to give away land for the sake of their souls; the kings grant exemption from folkright and constitute privileged estates held by book and following in the main the rules of individualized Roman law, and in the case of private persons to make provision for daughters and to deal with land as with other commodities producing constant collisions with the customary tribal views. Already, by the end of the Saxon period transfer and alienation of land make their way everywhere, and the Norman conquest brings these features to a head by substituting the notion of tenure—that is, of an estate burdened with service to a superior—for the ancient notion of tribal folkland.

But although the tribal basis of communal arrangements was shaken and removed in England in comparatively early times, it had influenced the practices of rural husbandry and landed life, and it has been so modified form of the Anglo-Saxon system that it survived right through the feudal period, leaving characteristic and material traces of its existence down to the present day.

To begin with, the open-field system with intermixture of strips and common rights in pasture and wood has been the prevailing system in England for more than a thousand years. Under the name of champion farming it existed everywhere in the country until the Inclosure Acts of the 18th and 19th centuries put an end to it; it may be found in operation even now in some of its features in backward districts. It would have been absurd to build up these practices of compulsory rotation of crops, of a temporary relapse of plots into common pasture between harvest and ploughing time, of the interdependence of thrifty and negligent husbandmen in respect of weeds and times of cultivation, &c., from the point of view of individual appropriation. On the other hand, it was the natural system for the apportionment of claims to the shareholders of an organic and perpetual joint-stock company.

Practices of shifting arable are seldom reported in English evidence. There are some traces of periodical redivisions of arable land in Northumberland: under the name of runrig system such practices seem to have been not uncommon in the outer fields, the non-manured portions of townships in Scotland, both among the Saxon inhabitants of the lowlands and the Celtic population of the highlands. The joining of small tenants for the purpose of coaration, for the formation of the big,
VILLAGE COMMUNITIES

heavy ploughs, drawn by eight oxen, also produced sometimes
the shifting in the possession of strips between the coparceners
of the undertaking. But, as a rule, the arable was held in
severalty by the different members of the township.

On the other hand, meadows were constantly owned by entire
townships and distributed between the tenements entitled to
shares from year to year either by lot or according to a definite
order. These practices are in full vigour in some places even
at the present day. Any person living in Oxford may witness
the distribution by lot on Lammas day (1st of August) of the
Lammas meadow, that is, the meadows inclosed for the sake
of raising hay-grass in the village of Yarnton, some three miles
to the north of Oxford.

Let us, however, return for a moment to the arable. Although
held in severalty by different owners it was subjected to all
sorts of interference on the part of the village union as repre-
sented in later ages by the manorial court framing by-laws and
settling the course of cultivation. It might also happen
that in consequence of encroachments, disputes and general
uncertainty as to possession and boundaries, the whole distrib-
ution of the strips placed among the various holdings had to be
given over and regulated anew. In an interesting case reported
from a Cartulary of Dunstable in Bedfordshire, all the possessions
of the villagers in a place called Segenhoe were thrown together
in the 12th century and redivided according to an award of
experts chosen by a meeting of the villagers from among the
oldest and wisest inhabitants.

Exactly as in the Danish examples quoted before, the strips
were apportioned, not to the single owners, but to the normal
holdings, the hides, and the actual owners had to take them
in proportion to their several rights in the hides. This point
is very important. It gives the English village community its
peculiar stamp. It is a community not between single members
or casual households, but between determined holdings con-
structed on a proportional scale. Although there was no provision for the admeasurement and equalization of the claims
of Smith and of Brown, each hide or ploughland of a township
took as much as every other hide, each virgate or yardland as
every other yardland, each bovate or oxgang as every other
oxgang. Now the proportions themselves, although varying
in respect of the number of acres included in each of these
united identical parts, were constant in their relation to each
other. The yardland was almost everywhere one-fourth of the
hide or ploughland, and corresponded to the share of two
oxen in an eight-oxen plough; the oxgang was reckoned at
one-half of the yardland, and corresponded to the share of one
ox in the same unit of work. The constant repetition of these
fractions and units proves that we have to do in this case with
phenomena arising not from artificial devices but from the very
nature of the case. Nor can there be a doubt that both the unit
and the fractions were produced by the application to land
of the chief factor of working strength in agrarian husbandry,
the power of the ploughteam for tillage.

The natural composition of the holdings has its counterpart,
as in Schleswig-Holstein and as in the rest of Germany, in the
customs of united succession. The English peasantry worked
out customary rules of primogeniture or of so-called Borough
English or claim of the youngest to the land held by his father.
The German examples adduced in the beginning of this article
teach us that the device is not suggested primarily by the in-
terest of the landlord. Unified succession takes the place of the
equal rights of sons, because it is the better method for preserving
the economic efficiency of the household and of the tenement
Corresponding to it. There are exceptions, the most notorious
being that of Kentish gavelkind, but in agricultural districts the
holding remains undivided as long as possible, and if it gets
divided, the division follows the lines not of the casual number
of coheirs, but of the organic elements of the ploughlands.
Fourth and eighths arise in connexion with natural fractions of
the ploughteam of eight oxen.

One more feature of the situation remains to be noticed,
and it is the one which is still before our eyes in all parts of
the country, that is, the commons which have survived the
wholesale process of inclosure. They were an integral part
of the ancient village community from the first, not only because
the whole ground of a township could not be taken up by arable
and meadows, at a time when population was scanty, but because
there existed the most intimate connexion between the
agricultural and pastoral part of husbandry in the time of the
open-field system. Pasture was not treated as a commodity
by itself but was mostly considered as an adjunct, as appendant
to the arable, and so was the use of woods and of turf. This
system was fully endorsed, e.g., in an Elizabethan case reported
by Coke—Tyringham's case. The problem of admeasurement
of pasture was regulated in the same way as that of the apportion-
tment of arable strips, by a reference to the proportional
holdings, the hides, yardlands and oxgangs of the township,
and the only question to be decided was how many heads of
beasts or of cattle and how many sheep each hide and yardland had
the right to send to the common pasturage grounds.

When in course of time the open-field system and the tenure
of arable according to holdings were given up, the right of free-
holding and occupancy of the old manors in which the ancient
townships were, as it were, encased, still held good, but it became
much more difficult to estimate and to apportion such rights.

In connexion with the individualistic policy of inclosure
the old writ of admeasurement of commons was abolished in
1837 (3 & 4 Will. IV.). The ordinary expedient is to make
out how much commonable cattle could be kept by the tene-
ments claiming commons through the winter. It is very
characteristic and important that in the leading modern case on
sufficiency of commons— in Robertson v. Hartopp—it was
admitted by the Court of Appeal that the sufficiency did not
to be construed as a right of turning out a certain number of
beasts on the common, quite apart from the number which
had been actually turned out at any given time. Now a vested
right has to be construed from the point of view of the time
when it came into existence. The standards used to estimate
such rights ought not to be drawn from modern practice, which
might help to dispense altogether with commons of pasture by
stable feeding, substitutes for grass, &c., but ought to correspond
to the ordinary usages established at a time when the open-field
system was in full vigour. The legal view stands thus at
present, but we cannot conscientiously consider ourselves
as equal to the task of discussing the intricacies incident to
the inroads achieved by individual appropriation it is by no means
certain that the reference to the rights and rules of a previous
period will continue to be recognized. However this may be,
in the present commons we have certainly a system which
draws its roots from customs, as to the origin of which legal
memory does not run.

We may, in conclusion, summarize very briefly the principal
results of our inquiry as to the history of European village
communities. It seems that they may be stated under the
following heads: (1) Primitive stages of civilization disclose
in human society a strong tendency towards mutual support
in economic matters as well as for the sake of defence. (2) The
most natural form assumed by such unions for defence and
co-operation is that of kinship. (3) In epochs of pastoral
husbandry and of the beginnings of agriculture land is mainly
owned by tribes, kindreds and enlarged households, while
individuals enjoy only rights of usage and possession. (4) In
course of time unions of neighbours are substituted for unions
of kinsmen. (5) In Germanic societies the community of the
tenure rests on the foundation of efficient holdings—the
hides, huften—kept together as far as possible by rules of united
or single succession. (6) The open-field system, which prevailed
in the whole of Northern Europe for nearly a thousand years,
was closely dependent on the customs of tribal and neighbourly
unions. (7) Even now the treatment of commons represents
the last manifestations of ancient communal arrangements, and
it can only be reasonably and justly interpreted by reference
to the law and practice of former times.

VILLALBA—VILLANELLE

The future editor of Mendoza’s Guerra de Granada, and to Bartolomé Jiménez Pátron, who subsequently dedicated Mercurius Triumregiustus to his pupil. On leaving Salamanca the youth married in 1604, and succeeded to the title on the death of his father in 1607; he was prominent in the life of the capital, acquired a bad reputation as a gambler, was forbidden to attend court, and resided in Italy from 1611 to 1617. On his return to Spain, he soon proved himself a fearless, pungent satirist. Such public men as Lerma, Rodrigo Calderón and Jorge de Tobar writhed beneath his murderous invective; the foibles of humbler private persons were exposed to public ridicule in verses furiously passed from hand to hand.

So great was the resentment caused by these envenomed attacks that Villamediana was once more ordered to withdraw from court in 1618. He returned on the death of Philip III, and was appointed gentleman in waiting to Philip IV’s young wife, Isabel de Bourbon, daughter of Henri IV. Secure in his position, he scattered his scathing epigrams in profusion; but his ostentatious attentions to the queen supplied his countless foes with a weapon which was destined to destroy him. A fire broke out while his masque, La Gloria de Nigua, was being acted before the court on the 15th of May 1622, and Villamediana carried the queen to a place of safety. Suspicion deepened; Villamediana neglected a significant warning that his life was in peril, and on the 21st of August 1622 he was murdered as he stepped out of his coach. For his death was divided between Philip IV. and Olivares; the actual assassin was either Alonso Mateo or Ignacio Mendez; and naturally the crime remained unpunished.

Villamediana’s works, first published at Saragossa in 1629, contain not only the nervous, blighting verses which made him widely feared and hated, but a number of more serious poems embodying the most exaggerated conceits of gongerism. But, when adopting the perversive conventions of the hour, he remains a poet of high distinction, and his satirical verses, more profound in form, are instinct with a cold, concentrated scorn which has never been surpassed. VILLANELLE, a form of verse, originally loose in construction, but since the 16th century bound in exact limits of an arbitrary kind. The word is ultimately derived from the Latin villa, a country house or farm, through the Italian villana, a peasant or farm hand, and a villanelle was primarily a round song taken up by men on a farm. The Spaniards called such a song a villancico or villanceto or a villancico, and a man who improvised such a villancico was a villanciquero. The villanelle was a pastoral poem made to accompany a rustic dance, and from the first it was necessary that it should contain a regular system of repeated lines. The old French villanelles, however, were irregular in form. One of the most celebrated, the “Rosette, pour un peu d’absence” of Philippe Desportes (1545-1606), is a sort of ballade, and those contained in the Aestre d’Urfe, 1610, are scarcely less unlike the villanelles of modern times. It appears, indeed, to have been by an accident that the special and rigorously defined form of the villanelle was invented. In the posthumous poems of Jean Passerat (1534-1602), which were printed in 1606, several villanelles were discovered, in which the first two lines of the stanza were to contain the title, and the last line give the title and its proper noun.

Villafranca, a town of north-western Spain, in the province of Lugo; on the left bank of the river Ladra, one of the head-streams of the Miño, and at the junction of the main roads from Ferrol and Mondrago to the city of Lugo. Pop. (1900) 13,572. Villalba is the chief town of the district watered by the Ladra. Tamboga and other small streams—a fertile plateau. Hot, above sea-level, cloth and pottery are manufactured, and there is some trade in grain and livestock. The nearest railway station is Otero, 15 m. S. by E. on the Lugo-Corunna line.

Villamediana, Count De (1582-1623), Spanish poet, was born at Lisbon towards the end of 1582. His father, a distinguished diplomatist, upon whom the dignity of count was conferred in 1603, entrusted the education of the brilliant boy (Juan de Tassis y Peralta) to Luis Triibaldos de Toledo,
This exquisite lyric has continued to be the type of its class, and the villanelle, therefore, for the last three hundred years has been a poem, written in tercets, on two rhymes, the first and the third line being repeated alternatively in each tercet. It is usual to confine the villanelle to five tercets, but that is not essential; it must, however, close with a quatrains, the last two lines of which are the first and third line of the original tercet. The villanelle was extremely admired by the French poets of the Parnasse, and one of them, Théodore de Banville, compared it to a ribband of silver and gold traversed by a thread of rose-colour. Boublier, who was the first to point out that Passerat was the inventor of the definite villanelle, published collections of these poems in 1787 and 1789, and was preparing another when he died in 1881. When, in 1877, so many of the early French forms of verse were introduced, or reintroduced, into English literature, the villanelle attracted a great deal of attention; it was simultaneously cultivated by W. E. Henley, Austin Dobson, Lang and Gosse. Henley wrote a large number, and he described the form itself in a specimen beginning:

"A dainty thing’s the Villanelle,
Sly, musical, a jewel in rhyme,
It serves its purpose passing well."

It has since then been very frequently used by English and American poets. There are several excellent examples in English of humorous villanelles, especially those by Austin Dobson and by Henley.

E. G.)

VILLANI, GIOVANNI (c. 1275-1348), Italian chronicler, was the son of Villano di Stollo, and was born at Florence in the second half of the 13th century; the precise year is unknown. He was of good burgher extraction, and, following the traditions of his family, applied himself to commerce. During the early years of the 14th century he travelled in Italy, France and the Netherlands to buy men and things with the sagacity alike of the man of business and the historian. Before leaving Florence, or rather in the interval between one journey and another, he had at least taken some part in that troubled period of civil contentions which Dino Compagni has described and which swept Dante Alighieri into banishment. In 1301 Villani saw Charles, count of Valois, ruining his country under the false name of peacemaker, and was witness of all the misery which immediately followed. Somewhat later he left Italy, and in September 1304 he visited Flanders. It is not well ascertained when he returned to his native city. He was certainly living there shortly after the emperor Henry VII. visited Italy in 1312, and probably he had been there for some time before. While still continuing to occupy himself with commerce, he now began to take a prominent part in public affairs. In 1316 and 1317 he was one of the priors, and shared in the crafty tactics whereby Pisa and Lucca were induced to conclude a peace with Florence, to which they were previously averse. In 1317 he also had charge of the mint, and during his administration of this office he collected its earlier records and had a register made of all the coins struck in Florence. In 1321 he was again chosen prior; and of the Florentines having just then undertaken the rebuilding of the city walls, he and some other citizens were deputed to look after the work. They were afterwards accused of having diverted the public money to private ends, but Villani clearly established his innocence. He was next sent with the army against Castruccio Castracani, lord of Lucca, and was present at its defeat at Altopascio. In 1328 a terrible famine visited many provinces of Italy, including Tuscany, and Villani was appointed to guard Florence from the worst effects of that distressing period. He has left a record of what was done in a chapter of his Chronicle, which shows the economic wisdom in which the medieval Florentines were often greatly in advance of their age. In 1339, some time after the death of Castruccio, some rich Florentine merchants, and among them Villani, treated for the acquisition of the island of Ischia by Florence for 80,000 florins, offering to supply the larger part of that sum out of their own private means; but the negotiations fell through, owing to the discords and jealousies then existing in the government (Chron. x. 143). The following year Villani superintended the making of Andrea Pisano's bronze doors for the baptistry. In the same year he watched over the raising of the campanile of the Badia, erected by Andrea and Giovanni Orsini (Chron. x. 177). In 1341 the acquisition of Lucca was attempted, and, this time with Martino della Scala, for 250,000 florins. Villani was Flino with Etins as a hostage to Ferrara, where he remained for some months. He was present in Florence during the unhappy period that elapsed between the entry of Walter of Brienne, duke of Athens, and his expulsion by the Florentines (1342-43). Involved through no fault of his own in the failure of the commercial company of the Bonaccorsi, which in its turn had been drawn into the failure of the company of the Bardol, Villani, towards the end of his life, suffered much privation and for some time was in prison. In 1348 he fell a victim to the plague described by Boccaccio.

The idea of writing the Chronicle was suggested to Villani under the following circumstances: "In the year of Christ 1300 Pope Boniface VIII. made in honour of Christ's nativity a special and general indulgence. Accordingly, putting myself in that blessed pilgrim-age in the holy city of Rome, seeing her great and ancient remains, and reading the histories and great deeds of the Romans as written by Virgil, Sallust, Lucan, Livy, Valerius, Paulus Orosius and other many other historians who wrote the exploits and glory, great and small, of the Romans and also of strangers, in the whole world... considering that our city of Florence, the daughter and offspring of Rome, is on the increase and destined to do great things, as Rome is by former declension and by being neglected in this volume and new chronicle all the facts and beginnings of the city of Florence, in as far as it has been possible to me to collect and discover them, and to follow the doings of the Florentines at length... and so in the year 1300, on my return from Rome, I began to compile this book, in honour of God and of the blessed John, and in praise of our city of Florence." Villani's work, written in a style which makes it a classic example in the historical literature of Italy, just as the history of Florence, the moment it emerges from the humble and uncertain origin assigned to it, is swept into a rich and powerful life of thought and action. Nothing but a careful perusal of the records that had preceded Villani's work, which rests in part on them. The Gesta Florentinorum of Sanzanne, starting from these vague origins, runs about to be dated 1225, at the union of Fiesole with Florence. The Cronica de Origine Civilitatis seems to be a compilation, made by various hands and at various times, in which the different legends regarding the city's origin have been gradually collected. The Annales Fiesolani (1110-1173) and the Annales Florentini Secundi (1107-1247), together with a list of the consuls and podestas from 1197 to 1267, and another chronicle, formerly attributed, but apparently without good reason, to Brunetto Latini, complete the series of ancient Florentine records. To these must, however, be added a certain quantity of facts which were to be found in various manuscripts, being used and quoted by authors, so that an unexpectedly rich and valuable periodical, posterior to Villani's time, of old records from which several chroniclers may have drawn, either without citing them at all or only doing so in a vague manner. The Historia Florentina, or Cronica universale, of Villani begins with Biblical times and comes down to 1348. The universality of Villani's work is extensive, especially in the times near Villani's own, while it bears witness to the great erudition of his mind, makes one also feel that the book was inspired within the walls of the universal city. Whereas Dino Compagni's Chronicle is confined within definite limits of time and place, this of Villani is a general chronicle extending over the whole of Europe. Dino Compagni feels and lives in the facts of his history; Villani looks at them and relates them calmly and fairly, with a serenity which makes him seem an outsider, though when he is mixed up in them. While very important for Italian history in the 14th century, this work is the cornerstone of the
VILLANOVA—VILLARD

early medieval history of Florence. Of contemporary events Villani has a very exact knowledge. Having been a sharer in the public affairs and in the intellectual and economic life of his native city, in its public and university cares, he has left us a clear and vivid account of what he saw with the vividness natural to a clear mind accustomed to business and to the observation of mankind. He was Guelf, but without passion; and his book is much more taken up with an interesting knowledge of fact than with the emotion of party conflicts. He is really a chronicler, not an historian, and has but little method in his narrative, often reporting the things which occurred long ago through tradition, and even interpolating, as if he fell into some inaccuracy; but such defects as he has are largely compensated for by his valuable qualities. He was for half a century a eyewitness of his history, and he provides abundant information about the customs and usages of the Tuscan com- mercies and arts; and among the chronicles throughout Europe he is perhaps unequalled for the value of the statistical data he has preserved. As a writer Villani is clear and acute; and, though his prose has not the force and colouring of Compagni's, it has the advantage of greater simplicity, so that, taking his work as a whole, he may be regarded as the greatest chronicler who has written in Italian. The many difficulties connected with the publication of this important text have hitherto prevented the presentation of a perfect edition. However, the Chronica has been printed by L. A. Muratori in tomo xii. of the Series Italicarum Scriptores (Milan, 1743), and has been edited by L. Moutier and F. G. Droz for the Bibliotheque de l'Universite de Geneve in 1849, and Reprint Edition, Leipzig (1852). Among other editions is one published at Trieste in 1857 and another at Turin in 1879. Selections have been translated into English by R. E. Sellans (1896).

Villani's works were continued by two other members of his family. (1) Matteo Villani, his brother, of whom nothing is known save that he was twice married and that he died of the plague at Milan in 1359. Yet he is inferior to Giovanni's, is nevertheless very valuable. A more prolix writer than his brother and a less acute observer, Matteo is well informed in his facts, and for the years of which he writes is one of the most important sources of Italian history.

(2) Filippo Villani, the son of Matteo, flourished in the end of the 14th and the beginning of the 15th century. In his continuation which goes down to 1404, though showing greater literary merit, he is very inferior as an historian to his predecessor. His most valuable work was a collection of lives of illustrious Florentines. Twice, in 1401 and 1404, he was chosen to explain in public the Dietas of the Medici, of his death is unknown.

Jahrhundert (Gottingen, 1876), and O. Hartwig, "G. Villani und die Leggende di Messer Gianni di Procida" in Band xxv. of H. von Sybel's Historische Zeitschrift. (U. B.)

VILLANOVA, the name given to an ancient cemetery in the neighbourhood of Bologna, Italy, and generally applied by archaeologists to all the remains of that period, and to the period itself, owing to the discovery therein of a large number of the characteristic remains of the earliest Iron Age of Italy. The antiquities of this culture are widely spread over upper Italy and differ essentially from those of the previous epoch known as Terramara, and they have been described by some as following at a considerable interval, for they show a great advance in metal work. The chief cemeteries of the Villanova period are at Bologna, Este, Villanova, Golasca, Trezzo, Rivoli and Oppiano. As there can be no doubt that the Terramara culture was that of the aboriginal Ligurians (see, however, Terramara), so the Villanova is that of the Umbrians, who, according to the historians, were masters of all northern Italy, as far as the Alps at the time of the Etruscan conquest (c. 1000 B.C.). They contain cist-graves, the bottoms, sides and tops being formed of flat unhewn stones, though sometimes there are only bottom and top slabs; the dead were burnt, and the remains are usually in a crouched position, playing the chief role but one ossuary; sometimes the vessel is covered with flat unhewn stones, inverted, sometimes the urns are deposited in the ground without any protection. The vases are often hand-made and adorned with incised linear ornament, though in later times the bones were often placed in bronze urns or buckets. Though iron is steadily making its way into use, flat, flanged, and socketed and looped celts of bronze are found in considerable numbers. Brooches of many kinds, ranging from the most primitive safety-pin fashioned out of a common bronze pin (such as those found in the Bronze Age settlement at Peschiera on Lake Maggiore), through many varieties, are in universal use. Representations of the human figure are practically unknown, but models of animals of a rude and primitive kind are very common, probably being votive offerings. These are closely parallel to the bronze figures found at Olympia, where human figures were likewise rare. All these objects are decorated in repoussé with geometric designs. The culture of the Villanova period is part of the Iron Age civilization, though the contents of the Hallstatt (grave) graves differ very considerably from the antiquities of the ordinary Villanova period, there is no breach of continuity between Hallstatt and Villanova, for the types of Vadaniana, Estense, Golasca and Villanova are found in the Hallstatt culture. The connexion between the north and the south of the Alps is never interrupted. The chief difference lies in the fact that the Celts of the Danubian region made greater advances in the development of weapons and defensive armour than their kindred in northern Italy. The Po and Danube regions alike are characterized by bronze buckles, cist-graves and the like, wrought in repoussé work and with geometric designs; but the introduction of iron into Italy is considerably posterior to its development in the Hallstatt area.

See Montelius, La Civilisation primitive en Italie; Ridgeway, Early Age of Greece, vol. i.; Brizio, in C. R. Acad. Itur. (1907), pp. 145, 154. Villanueva is a town of western Spain, in the province of Badajoz, near the left bank of the river Guadiana, and on the Madrid-Badajoz railway. Pop. (1900) 12,840. Villanueva is a busy modern town, with manufactures of cotton, woolen, silk, and other goods, and a paper mill. It has also ironfoundries and an important agricultural trade, with good markets and deep anchorage; it is a lifeboat station and the headquarters of a large fishing fleet. The coasting trade is also considerable. Villanueva has a museum, founded by the Catalan poet, historian and diplomat, Vittorio Balaguer (1824-1901), which contains collections of Roman, Egyptian and prehistoric antiquities, besides paintings, engravings, sculptures, coins and a large library, including many valuable MSS.

VILLARD, HENRY (1835-1900), American journalist and financier, was born in Speyer, Rhenish Bavaria, on the 10th of April, 1835. His baptismal name was Ferdinand Heinrich Gustav Hilgard. His parents removed to Zweibrücken in 1839, and in 1856 his father, Gustav Leonhard Hilgard (d. 1867), became a justice of the Supreme Court of Bavaria, at Munich. Henry was educated at the Gymnasium of Zweibrücken, at the French semi-military academy in Phalsbourg in 1849-50, at the gymnasium of Speyer in 1850-52, and at the universities of Munich and Würzburg in 1852-53; and in 1853, having had a disagreement with his father, emigrated—without his parents' knowledge—to the United States. It was at this time that he adopted the name of Villard. Making his way westward in his native land, he held in turn at Cincinnati, Belleville (Illinois) and Chicago, engaged in various employments, and in 1856 formed a project, which came to nothing, for establishing a colony of "free soil" Germans in Kansas. In 1856-57 he was editor, and for part of the time was proprietor, of the Racine (Wis.) Volksblatt, in which he advocated the election of John C. Frémont (Republican). Thereafter he was associated (in 1857) with the Staats-Zeitung, Frank Leslie's and the Tribune, of New York, and with the Cincinnati Commercial
in 1859-60; was correspondent of the New York Herald in 1861 and of the New York Tribune (with the Army of the Potomac) in 1862-63, and in 1865 was at the front as the representative of a news agency established by him in that year at Washington. In 1865 he became Washington correspondent of the Chicago Tribune, and in 1866 was the correspondent of that paper in the Prusso-Austrian War. He began to take an interest in railway financing in 1871, when he was elected president of the Oregon & California railroad and of the Oregon Steamship Company in 1876, was receiver of the Kansas Pacific railway in 1876-78, organized the Oregon Railway & Navigation Company in 1879, the Oregon Improvement Company in 1880, and the Oregon & Transcontinental Company in 1881, becoming in that year president of the Northern Pacific railway, which was completed under his management, and of which he remained president until 1883. In 1887 he again became connected with the Northern Pacific, and in 1889 was chosen chairman of its finance committee. He was actively identified with the financing of other Western railway projects until 1893. In 1881 he acquired the New York Evening Post and the Nation. In 1883 he paid the debt of the state university of Oregon, and gave to the institution $50,000, and he also gave to the town of Zwillbrücken, the home of his boyhood, an orphan asylum (1891). He died on the 12th of November 1900.

VILLA REAL, the capital of the district of Villa Real, Portugal; 10 m. N. of the river Douro and 47 m. by road E.N.E. of Oporto. Pop. (1900) 6716. The town has a large trans-Atlantic trade in wine, mineral waters and live stock, especially pigs. The administrative district of Villa Real corresponds with the western part of the ancient province of Traz os Montes (q.v.). Pop. (1900) 242196; area, 1656 sq. m. There are alkaline waters and baths at Vidago (near Chaves) and at Pedras Salgadas (near Villa Pouca d'Aguilar). The district adjacent to the Douro is known as the Pâiz do vinho, or "wine country"; here are the vineyards from which "port" wine is mostly charged.

VILLARET DE JOUYUSE, LOUIS THOMAS (1759-1812), French admiral, was born at Auch, of a noble family of Languedoc. He was originally destined for the church, but served for some time in the royal guard, which he had to leave at the age of sixteen after killing one of his comrades in a duel. He then entered the navy, and in 1773 left the French and in Indian waters. In 1778 he distinguished himself at the siege of Pondicherry and was promoted captain. He afterwards served under Suffren, took part in the battle of Cuddalore, and in 1781 was taken prisoner in a force encounter with an English vessel. He was released in 1785, and, unlike the majority of naval officers, did not emigrate during the Revolution. In 1791 he was in command of the Prudente in the waters of San Domingo, and in 1792 was appointed rear-admiral and assisted the Conventional, St André, in the reorganization of the fleet. Villaret was in command of the French fleet at the battle of the First of June. He was appointed a member of the Council of the Ancients in 1796, and was sentenced to deportation in the following year on account of his royalist sympathies. He escaped arrest, however, and until the Consulate lived in obscurity at Oléron. In 1801 he commanded the squadron which transported the French army to San Domingo, and the following year was made captain-general of Martinique, which he surrendered to the English in 1809 after a brave defence. In 1811, after some hesitation on the part of Napoleon, Villaret was rewarded for his services with the command of a military division and the post of governor-general of Venice. He died at Venice.

VILLARI, PASQUALE (1827-1905), Italian historian and statesman, was born at Naples on the 1st of October 1827. He studied together with Luigi la Vista under Francesco de Sanctis. He was implicated in the riots of the 15th of May 1848 at Naples, against the Bourbon government, and had to take refuge in Florence. There he devoted himself to teaching and historical research in the public libraries, and in 1859 he published the first volume of his Storia di Girolamo Savonarola e de' suoi tempi, in consequence of which he was appointed professor of history at Pisa. A second volume appeared in 1861, and the work, which soon came to be recognized as an Italian classic, was translated into various foreign languages. (See for instance Note e documenti del conte Niccolò Machiavelli e i suoi tempi (1877-83).) In the meantime Villari had left Pisa and was transferred to the chair of philosophy of history at the Institute of Studii Superiori in Florence, and he was also appointed a member of the council of education (1862). He served as a juror at the international exhibition of that year in London, and contributed an important monograph on education in England and Scotland. In 1869 he was appointed under-secretary of state for education, and shortly afterwards was elected member of parliament, a position which he held for several years. In 1884 he was nominated senator, and in 1891-92 he was minister of education in the Marchese di Rudini's first cabinet. In 1893-94 he collected a number of essays on Florentine history, originally published in the Nuova Antologia, under the title of I primi due secoli della storia di Firenze, and in 1901 he produced Le invasioni barbariche in Italia, a popular account in one volume of the events following the dissolution of the Roman empire. All these works have been translated into English by the historian's wife, Linda White Villari. Another side of Villari's activity was his interest in the political and social problems of the day; and although never identified with any political party, his speeches and writings have always commanded considerable public attention.

Among his other literary works may be mentioned: Saggi Critici (1868); Arte, Storia, e Filosofia (Florence, 1884); Scritti storici (Bologna, 1893); another volume of Saggi Critici (Bologna, 1896); and a volume of Discusioni istoriche e discorsi (Bologna, 1905), containing his speeches as president of the Dante Alighieri Society. His most important political and social essays are collected in his Lettere Meridionali ed altri scritti sulla questione sociale in Italia (Turin, 1885), and Scritti sulla questione sociale in Italia (Florence, 1902). The Lettere Meridionali (originally published in the newspaper L'Opinione in 1875) produced a deep impression, as they were the first expression of the real conditions of southern Italy. A selection of Villari's essays, translated by his wife, has been published in England (1907).

See also Francesco Baldasseroni, Pasquale Villari (Florence, 1907).

VILLA RICA, the largest city in the interior of Paraguay, on the railway from Asuncion (70 m. N.W.) to Encarnacion, Pop. (1910) about 25,000. Situated in a rich agricultural region watered by the upper Tepereyac, with finely timbered and extensive lands, it is a healthy place. It has an important trade in tobacco and yerba mate. It is to a great extent modern, and contains some fine buildings, including a national college, a church, many schools, and a branch of the Agricultural Bank.

VILLARREAL, a town of eastern Spain, in the province of Castellón de la Plana; 4 m. from the Mediterranean Sea, near the right bank of the river MiJares, and on the Barcenal-Valencia railway. Pop. (1900) 16,668. Villarreal has a station on the light railway between Onda and the seaports of Castellon de la Plana and Burriana. Under Moorish rule, up to the expulsion of the Moriscos in 1609, it was the headquarters of a flourishing trade, and in modern times its industries have revived. Palm-groves, churches with blue-tiled cupolas, and houses with flat roofs and view-turrets (miradores) to some extent preserve the Moorish character of the town. There are extensive orange-groves, watered by the irrigation canal of Castellon, which is a good example of Moorish engineering skill. The local industries include manufacture of paper, woolen goods and silk products.
served in the light cavalry in the Dutch wars, and distinguished himself by his daring and resourcefulness. But in spite of a long record of excellent service under Tyrone, Condé and Luxembourg, and of his aristocratic birth, his promotion was but slow, for he had incurred the enmity of the powerful Louvois, and although he had been proprietary colonel (mestre de camp) of a cavalry regiment since 1674, thirteen years elapsed before he was made a maréchal de camp. In the interval between the Dutch wars and the formation of the League of Augsburg, Villars, who combined with his military gifts the tact and subtlety of the diplomatist, was employed in an unofficial mission to the court of Bavaria, and there became the constant companion and friend of the Elector Charles with whom the Turks and fought at Mohacs. He returned to France in 1690 and was given a command in the cavalry of the army in Flanders, but towards the end of the Grand Alliance War he went to Vienna as ambassador. His part in the next war (see Spanish Succession War), beginning with Friedlingen (1702) and Hochstadt (1703) and ending with Denain (1712), has made him immortal. For Friedlingen he received the marshalate, and for the pacification of the insurgent Cévennes the Saint-Ésprit order and the title of duke. Friedlingen and Hochstadt were barren victories, and the Treaty of Utrecht ruined the prospects of Villars. Villars's glory thus begins with the year 1709 when France, apparently helpless, was roused to a great effort of self-defence by the exorbitant demands of the Coalition. In that year he was called to command the main army opposing Eugene and Marlborough on the northern frontier. During the famine of the winter he shared the soldiers' miserable rations. When the campaign opened the old Marshal Boufflers volunteered to serve under him, and after the terrible battle of Malplaquet (9th), in which he was gravely wounded, he was able to tell the king: "If it please God to give your majesty's enemies another such victory, they are ruined." Two more campaigns passed without a battle and with scarcely any advance on the part of the invaders, but at last Marlborough manoeuvred Villars out of the famous Ne plus ultra lines, and the power of the defence seemed to be broken. But Louis made a last effort, the English contingent and its great leader were withdrawn from the enemy's camp, and Villars, though still suffering from his Malplaquet wounds, outmanoeuvred and decisively defeated Eugene in the battle of Denain. This victory saved France, though the war dragged on for years more and again came to the Rhine, where Villars took Landau, led the stormers at Freiburg and negotiated the peace of Rastatt with Prince Eugene.

He played a conspicuous part in the politics of the Regency period as the principal opponent of Cardinal Dubois, and only the memories of Montmorency's rebellion prevented his being made constable of France. He took the field for the last time in the War of the Polish Succession (1734), with the title "marshal-general of the king's armies," that Turenne alone had held before him. But he was now over eighty years of age, and the war was more diplomatic than earnest, and after opening the campaign with the fire and resolute energy of his youth he died at Turin on the 17th of June 1734.

Villars's memoirs show us a "fanfaron plein d'honneur," as Voltaire calls him. He was indeed boastful, with the gaiety of his native province, and also covetous of honours and wealth. But he was an honourable man of high courage, moral and physical, and a soldier who stands above all his contemporaries and successors in the 18th century, on the same height as Marlborough and Frederick.

The memoirs, part of which was published in 1734 and afterwards several times published in various versions, were for the first time completely edited by the Marquis de Vogué in 1884-92.

VILLAVICIOSA, a seaport of northern Spain, in the province of Oviedo; on the Ria de Villaviciosa, an estuary formed by the small river Villaviciosa which here enters the Bay of Biscay. Pop. (1900) 20,995. The town is the headquarters of a large fishery, and has some coating trade. Its exports are chiefly agricultural produce. Villaviciosa suffers from the competition of the neighbouring ports of Gijón and Avilés, and from the lack of railway communication. It is connected by good roads with Siero (9 m.), and Inteles (60 m.) on the Oviedo-Infanzón railway.

VILLEFRANCHE-DE-ROUERGUE, a town of France, capital of an arrondissement in the department of Aveyron, 36 m. W. of Rodez by road. Pop. (1906) town, 6297; commune, 3352. Villefranche, which has a station on the Orleans railway, lies amongst the hills on the right bank of the Aveyron at its junction with the Alzou. One of the three bridges that cross the river belongs to the 13th century, and the straight, narrow streets are full of gabled houses of the 13th and 14th centuries. One of the principal thoroughfares passes beneath the porch of Notre-Dame. The church is of the 13th and 14th centuries and the cloisters date from 1260 to 1381, the massive tower which surmounts its porch being of late Gothic architecture. The remarkable woodwork in the choir dates from the 13th century. A Carthusian monastery overlooking the town from the left bank of the Aveyron derives much interest from the completeness and fine preservation of its buildings, which date from the 15th century. They include a fine refectory and two cloisters, the smaller of which is a masterpiece of the late Gothic style. The manufacture of leather, animal-traps, hosery, bell-founding, hemp-spinning, and mills of low water-power are worked.

Villefranche, founded about 1252, owes its name to the numerous immunities granted by its founder Alphonse, count of Toulouse (d. 1271), and in 1348 it was so flourishing that sumptuary laws were passed. Soon afterwards the town fell into the hands of Edward, the Black Prince, but was the first place in Guienne to rise against the English. New privileges were granted to the town by King Charles V., but these were taken away by Louis XI. In 1588 the inhabitants repulsed the forces of the League, and afterwards murdered a governor sent by Henry IV. The town was ravaged by plague in 1643, 1658 and 1668, and in 1643 a revolt, excited by the actions of the intendents, was cruelly repressed.

VILLEFRANCHE-SUR-SAÔNE, a manufacturing town of east-central France, capital of an arrondissement in the department of Rhône, on the Morzon near its junction with the Saône, 21 m. N. by W. of Lyons by rail. Pop. (1906) 14,704. Among its industries the chief are the manufacture of working clothes, the manufacture, dyeing and finishing of cotton fabrics, the spinning of cotton thread, copper founding, and the manufacture of paper. The Beaujolais, hemp, cloth, linen, cottons, drapery goods and cattle are the principal articles of trade. An old Renaissance house is used as the town hall. The church of Notre-Dame des Marais, begun at the end of the 14th and finished in the 16th century, has a tower and spire (rebuilt in 1862), standing to the right of the façade (15th century), in which are carved wooden doors. Villefranche is the seat of a sub-prefecture and has tribunals of first instance and of commerce, a chamber of commerce and a communal college among its public institutions.

Founded in 1112 by Guichard IV., count of Beaujeu, Villefranche became in the 14th century capital of the Beaujolais. As a punishment for an act of violence towards the mayor's daughter, Edward II. was forced to surrender the Beaujolais to the duke of Bourbon.

VILLEGAS, ESTEBAN MANUEL DE (1589-1660), Spanish poet, was born at Matute (Logroño) on the 3th of February 1589, matriculated at Salamanca on the 20th of November 1610, and challenged attention by the mingled arrogance and accomplishment of Las Eréticas (1617), a collection of clever translations from Horace and Anacreon of original poems, the charm of which was marred by the writer's petulant vanity. Married in 1626 or earlier, Villegas practised law at Nájera till 1659, when he was charged with expressing unorthodox views on the subject of free will; he was exiled for four years to Santa Maria de Ribaredonda, but was allowed to return for three months to Nájera in March 1660. It seems probable that the rest of the sentence was remitted, for the report of the local inquisition lays stress on Villegas's simple piety, on the extravagance of his attire,
VILLEHARDOUIN

GEORGY DE (c. 1160-c. 1213), the first vernacular historian of France, and perhaps of modern Europe, who possesses literary merit, is rather supposed than known to have been born at the château from which he took his name, near Troyes, in Champagne, about the year 1160. Not merely his literary and historical importance, but almost all that is known about him, comes from his chronicle of the fourth crusade, or Conquête de Constantinople. Nothing is positively known of his ancestry, for the supposition (originating with Du Cange) that a certain William, marshal of Champagne between 1148 and 1157, was his father is erroneous. Villehardouin himself, however, undoubtedly held this dignity, and certain minute and perhaps not very trustworthy indications, chiefly of an heraldic character, have led his most recent biographers to lay it down that he was not born earlier than 1150 or later than 1164. He introduces himself to us with a certain abruptness, merely specifying his own name as one of a list of knights of Champagne who with their count, Thibault, took the cross at a tournament held at Escry-sur-Aisne in Advent 1189, the crusade in contemplation having been started by the preaching of Puille de Neully, who was commissioned thereto by Pope Innocent III. The next year six deputies, two appointed by each of the three allied counts of Flanders, Champagne and Blois, were despatched to Venice to negotiate for ships. Of these deputies Villehardouin was one and Quenes de Béthune, the poet, another. They concluded a bargain with the seigniors for transport and provisions at a fixed price. Villehardouin had hardly returned when Thibault fell sick and died; but this did not prevent, though it somewhat delayed, the enterprise of the crusaders. The management of that enterprise, however, was a difficult one, and cost Villehardouin another embassy into Italy. In 1201 he was left in the charge of the crusade, and breaking the treaty with the Venetians by embarking at other ports and employing other convey. He was only in part successful, and there was great difficulty in raising the charter-money among those who had actually assembled (in 1202) at Venice, the sum collected falling far short of the stipulated amount. It is necessary to remember this when the somewhat erratic and irregular character of the operations which followed is judged. The defence that the crusaders were bound to pay their passage-money to the Holy Land, in one form or other, to the Venetians, is perhaps a weak one in any case for the attack on two Christian cities, Zara and Constantinople; it becomes weaker still when it is found that the expedition never went or attempted to go to the Holy Land at all. But the desire to discharge obligations incurred is no doubt respectable in itself, and Villehardouin, as one of the actual negotiators of the bargain, must have felt it with peculiar strength.

The crusaders set sail at last, and Zara, which the Venetians coveted, was taken without much trouble. The question then arose whether the host should go next. Villehardouin does not tell us what effect the taking of Zara had on his impression of the empire of the East—debates in which the chief ecclesiastics present strongly protcated against the diversion of the enterprise from its proper goal. It is quite clear, however, that the marshals of Champagne, who was one of the leaders and inner counsellors of the expedition throughout, sympathized with the majority, and it is fair to point out that the temptation of chivalrous adventure was probably as great as that of gain. He narrates spiritedly enough the discussions and decisions in the winter camp of Zara and at Corfu, but is evidently much more occupied when the voyage was again resumed, and, after a fair passage round Greece, the crusaders at last saw before them the great city of Constantinople which they had it in mind to attack. When the assault was decided upon, Villehardouin himself was in the fifth "battle," the leader of which was Mathieu de Montmorency. But, though his account of the siege is full of personal touches, and contains one reference to the number of witnesses whose testimony he took for a certain wonderful fact, he does not tell us anything of his own prowess. After the flight of the usurper Alexius, and when the blindлас was taken, the chronicler accounts in detail of the expedition taken by the Greeks from prison and placed on the throne, Villehardouin, with Montmorency and two Venetians, formed the embassy sent to arrange terms. He was again similarly distinguished when it became necessary to remonstrate with Alexius, the blind man's son and virtual successor, on the non-keeping of the terms. Indeed Villehardouin's talents as a diplomatist seem to have been held in very high esteem, for later, when the Latin empire had become a fact, he was charged with the delicate business of mediating between the emperor Baldwin I. and the Venetian capitols, and on the occasion of which task he had at least partial success. He was also appointed by the Bishop of "Romanie"—a term very vaguely used, but apparently signifying the mainland of the Balkan peninsula, while his nephew and namesake, afterwards prince of Achaia, took a great part in the Latin conquest of Peloponnesus. Villehardouin himself before long received an important command against the Bulgarians. He was left to maintain the siege of Adrianople when Baldwin advanced to attack the relieving force, and with Dandolo had much to do in saving the defeated crusaders from utter destruction, and conducting the retreat, in which he commanded the rear-guard, and brought his troops in safety to the sea of Rodosto, and thence to the capital. As he occupied the post of honour in this disaster, so he had that (the command of the vanguard) in the expedition which the regent Henry made shortly afterwards to revenge his brother Baldwin's defeat and capture. And, when Henry had succeeded to the crown on the announcement of Baldwin's death, it was Villehardouin who fetched home his bride Agnes of Montferrat, and shortly afterwards commanded under him in a naval battle with the ships of Theodore Lascaris at the fortress of Rodosto. The following battle on the Lascari coast, in which with Lascaris, Villehardouin received the fief of Messinopolis (supposed to be Mosynopolis, a little inland from the modern Gulf of Lagos, and not far from the ancient Abdera) from Boniface of Montferrat, with the record of whose death the chronicle abruptly closes.

In the foregoing account only those particulars which bear directly on Villehardouin himself have been detailed; but the chronicle is as far as possible from being an autobiography, and the displays of the writer's personality, numerous as they are, are quite involuntary, and consist merely in his way of handling the subject, not in the references (as brief as his functions as chronicler will admit) to his own proceedings. The chronicle of Villehardouin quickly and to be the very best historical of the history of the crusades is written for the interest which brought about the crusades, stimulated the vast literary development of the 12th and 13th centuries, and sent knights-errant, principally though not wholly of French blood, to establish principalities and kingdoms throughout Europe and the nearer East. On the whole, no doubt, it is the more masculine and practical side of this enthusiastic state of mind which Villehardouin shows. No woman makes any but the most subordinate appearances in his pages, and it must of course be remembered that he was certainly a man past middle life when the events occurred, and perhaps a man approaching old age when he set out from Acre. Despite the strong personal touch and there, exhibiting the impression which the beauty of sea and land, the splendour of Constantinople, the magnitude of the effects but still imposing Greek power, made on him, there is not only an entire absence of dilution and conflation of such subjects as a modern would have dilated on (that was to be expected), but an absence likewise of the elaborate and painful description of detail in which contemporary
The book appears to have been known in the ages immediately succeeding his own; and, though there is no contemporary manuscript in existence, there are some half-dozen which appear to date from the end of the 13th or the course of the 14th century, and at least appears to be a copy made from his own work in that spirit of unintelligent faithfulness which is much more valuable to posterity than more pragmatical editing. The first printed edition was a French book, Le Francos, by L. Villehardouin, published in Paris in 1585, is dedicated to the seignory of Venice (Villehardouin, it should be said, was accused of a rather unfair predilection for the Venetians), and speaks of either a part or the whole of the memoirs in its edition of 1823. On the whole, this whole work is a patched-up nothing seems to be known. A better edition, founded on a Netherlandish MS, appeared at Lyons in 1601. But these were the greatly anticipated and a new edition of Du Cange in 1787, wherein that learned writer employed all his knowledge, never since equalled, of the subject, but added a translation, or rather paraphrase, into modern French which is scarcely worthy of the credit of his author. Dom Brial gave a new edition from different MS sources in 1823, and the book figures with different degrees of dependence on Du Cange and Brial in the collections of Petit, Bouhon, and Michaud and Poujoulat. All these editions were the productions of Natais de Wailly (1872 and 1874), in which the text is critically edited from all the available MSS. and a new translation added, while there is still later and rather better one by E. Bouchet (2 vols., Paris, 1891), which, however, rests mainly on N. de Wailly for text. The charm of Villehardouin can escape no reader; but few readers will fail to derive some additional pleasure from the two essays which Sainte-Beuve devoted to him, reprinted in the ninth volume of the "Coutures du lundi." See also A. Deliboud, Les Chroniqueurs (1888). There are English translations by T. Smith (1829), and (more literally) Sir F. T. Marzials (Everyman's Library, 1908).

**Villéle, Jean Baptiste Guillaume Marie Sérarin, Comte de (1773-1830)**

Villéle, the French statesman, was born at Toulouse on April 1773 and educated for the navy. He joined the "Bayonnaise" at Brest in July 1788 and served in the West and East Indies. Arrested in the Isle of Bourbon under the Terror, he was set free by the revolution of Thermidor (July 1794). He acquired some property in the island, and married in 1799 the daughter of a great proprietor, M. Desbassins de Richemont, whose estates he had managed. His apprenticeship to politics was served in the Colonial Assembly of Bourbon, where he fought successfully to preserve the colony from the consequences of perpetual interference with the American War. Prosperity and peace made it necessary to prevent local discontent from appealing to the English for protection. The arrival of General Decaen, sent out by Bonaparte in 1802, restored security to the island, and five years later Villèle, who had now realized a large fortune, returned to France. He was mayor of his commune, and a member of the council of the Haute-Garonne under the Empire. At the restoration of 1814 he at once declared for royalist principles. He was mayor of Toulouse in 1814-15 and deputy for the Haute-Garonne in the "Chambre Introuvable" of 1815. Villèle, who before the promulgation of the charter had written "Le projet de constitution" opposing it, as too democratic in character, naturally took his place on the extreme right with the ultra-royalists. In the new Chamber of 1816 Villèle found his party in a minority, but his personal authority nevertheless increased. He was looked on by the
ministerialists as the least unreasonable of his party, and by the "ultras" as the safest of their leaders. Under the electoral law of 1817 the Abbé Grégoire, who was popularly supposed to have voted for the death of Louis XVI. in the Convention, was admitted to the Chamber of Deputies. The Conservative party gained strength from the alarm raised by this incident and withdrew from the shock caused by the assassination of the Duc de Berri. The Duc de Richelieu was compelled to admit to the cabinet two of the chiefs of the Left, Villèle and Corbière. Ville de Richelieu resigned within a year, but on the fall of Richelieu at the end of 1821 he became the real chief of the new cabinet, in which he was minister of finance. Although not himself a courtier, he was backed at court by Sosthènes de Rochecoult and Madame du Cayla, and in 1822 Louis XVIII. gave him the title of count and made him formally prime minister. He immediately proceeded to muzzle opposition by stringent press laws, and the discover of minor liberal conspiracies afforded an excuse for further repression. Forced against his will into interference in Spain by Mathieu de Montmorency and Chateaubriand, he contrived to reap some credit for the monarchy from the successful campaign of 1823. Meanwhile he had consolidated the royal power by persuading Louis XVIII. to swamp the liberal majority in the upper house by the nomination of twenty-seven new peers; he availed himself of the temporary popularity of the monarchy after the Spanish campaign to summon a new Chamber of Deputies. This new and obedient legislature, in which only nineteen peers were included, was brought to order by a new ministry, the legislature, the ministry to which the upper house was subject, was thus deprived of a greater advantage than the lower house. The ministry, thus providing time, it was thought, to restore some part of the ancien régime. Ville de Villèle's plans were assisted by the death of Louis XVIII. and the accession of his bigoted brother. Prudent financial administration since 1815 had made possible the conversion of the state bonds from 3 to 4%. It was proposed to utilize the money set free by this operation to indemnify by a milliard francs the emigrés for the loss of their lands at the Revolution; it was also proposed to restore their former privileges to the religious congregations. Both these propositions were, with some restrictions, secured. Socialism was made a crime punishable by death, and the ministry were preparing a law to alter the law of equal inheritance, and thus create anew the great estates. These measures roused violent opposition in the country, which a new and stringent press law, nicknamed the "law of justice and love," failed to put down. The peers rejected the law of inheritance and the press law; it was found necessary to disband the National Guard; and in November 1827 seventy-six new peers were created, and recruse was had to a general election. The new Chamber proved hostile to Ville de Villèle, and the ministry resigned. The ministry of moderate ministry of Martignac.

The new ministry made Ville de Villèle's removal to the upper house a condition of taking office, and he took no further part in public affairs. At the time of his death, on the 13th of March 1834, he had advanced as far as 1816 with his memoirs, which were completed from his correspondence by his family as Mémoires et correspondance du comte de Villèle (Paris, 5 vols., 1887-90).

See also C. de Marade, L'Opposition royaiste (Paris, 1843); J. C. Hyndman, Notice sur le comte de Villèle (Paris, 1899); and M. Chotard, "L'œuvre financière de M. de Villèle," in Annales des sciences politiques (vol. v., 1890).

VILLEMAIN, ABEL FRANÇOIS (1790-1867), French politician and man of letters, was born in Paris on the 9th of June 1790. He was educated at the lycée Louis-le-Grand, and became assistant master at the lycée Charlemagne, and subsequently at the École Normale. In 1812 he gained a prize from the Academy with an éloge on Montaigne. Under the restoration he was appointed, first, assistant professor of modern history, and then professor of French eloquence at the Sorbonne. Here he delivered a series of literary lectures which had an extraordinary effect on his younger contemporaries. Villemain had the great advantage of coming just before the Romantic movement, of having a wide and catholic love of literature without being an extremist. All, or almost all, the clever young men of the brilliant generation of 1830 passed under his influence; and, while he pleased the Romantics by his frank appreciation of the beauties of English, German, Italian and Spanish poetry, he had not the least inclination to decry the classics—either the classics proper of Greece and Rome or the so-called classics of France. In 1819 he published a book on Cromwell, and two years later he was elected to the Académie. Villemain was appointed by the restoration government "chef de l'imprimerie et de la librairie," a post involving a kind of irregular censorship of the press, and afterwards to the office of master of requests. Before the revolution of July he had been deprived of his office for his liberal tendencies, and had been elected deputy for Évreux. Under Louis Philippe he received a peerage in 1832. He was a member of the council of public instruction, and was twice minister of that department, and he also became secretary for the learned academy. During the whole of the July monarchy he was thus one of the chief dispensers of literary patronage in France, but in his later years his reputation declined. He died in Paris on the 8th of May 1867.

Villemain's chief work is his Cours de la littérature française (5 vols., 1828-39). Among his other works are: Tableau de la littérature du moyen âge (2 vols., 1845); Tableau de la littérature au XVIIIe siècle (4 vols., 1845); Souvenirs contemporains (2 vols., 1856); Histoire de Grégoire VII. (2 vols., 1873; Eng. trans., 1874). Among notices on Villemain may be cited that of Louis de Loménie (1841), E. Mirecourt (1858), J. L. Dubut (1875). See also Sainte-Beuve, Notes et pensées (1876).
VILENA—VILLENAGE

19th century in Larra's Macias and in Hartzenbusch's play La Redoma encantada. (J. F. K.)

VILENA, a town of eastern Spain, in the province of Alicante; on the right bank of the river Vinalapo, and at the junction of railways from Valencia, Alicante, Alhacete and Yecla. Pop. (1900) 14,090. Vilena is a labyrinth of winding alleys, which contain some interesting examples of Moorish domestic architecture. It is dominated by a large and picturesque Moorish castle. The surrounding hills are covered with vines, and to the east there is an extensive salt lagoon. Silk, linen, flour, wines, oranges, and tobacco are among the chief crops of the district.

VILLENAGE (Villainage, Villenage, Villegenage), a medieval term (from villa, villanus), pointing to serfdom, a condition of men intermediate between freedom and slavery. It occurs in France as well as in England, and was certainly imported into English speech through the medium of Norman French. The earliest instances of its use are to be found in the Latin and French versions of English documents in the 11th and 12th centuries (cf. Domesday Book; Liebermann, Glossary to the Gesetze der Angelsachsen, s.v. villanus, vilain). The history of the word and of the condition is especially instructive in England.

The materials for the formation of the villein class were already in existence in the Anglo-Saxon period. On the one hand, the Saxon ceorls (twyndynden), although considered as including the typical freemen in the earlier laws (Ethelberht, Hlothhere and Edric, Ine), gradually became differentiated through the action of political and economic causes, and many of them had to recognize the patronage of magnates or to seek livelihood as tenants on the estates of the latter. These ceorls, sitting on gallo-lend, were, though personally free, considered as a lower order of men, and lapsed gradually into more or less oppressive subjection in respect of the great landowners. It is characteristic in this connexion that the West Saxon laws do not make any distinction between ceorls and laets or half-freemen as the Kentish laws had done; this means that the half-free people were, if not Welshmen, reckoned as members of the ceorl class. Another remarkable indication of the decay of the ceorl's estate is afforded by the fact that in the treaties with the Danes the twyndynden are equated with the Danish leydings or freemen. It does not mean, of course, that their condition was practically the same, but it does mean that the tenure which had come to separate the two principal subdivisions of the free class—the ceorl and the thane. The Latin version of the Rectitudines Singularum Personarum, a document compiled probably in the 11th century, not long before the Conquest, renders genet (a peasant tenant of a superior kind performing lighter services than the gebur, as he was burdened with heavy week-work) by villanus; but the gebur came to be also considered as a villanus according to Anglo-Norman terminology. The group designated as geburs in Anglo-Saxon charters, though distinguished from mere slaves (thene baerde-baerdebaerde, Kemble, Cod. Dipl. 1079), undoubtedly included many freemen who in point of services and economic subjection were not very much above the slaves. Both ceorls and geburs disappear as separate classes, and it is clear that the greater part of them must have passed into the rank of villeins.

In the terminology of the Domesday Inquest we find the villeins as the most numerous element of the English population. Out of about 240,000 households enumerated in Domesday 100,000 are marked as belonging to villeins. They are rustics performing, as a rule, work services for their lords. But not all the inhabitants of the villages were designated by that name. Villeins are opposed to socmen and freemen on one hand, to bordarii, cottagers and slaves on the other. The distinction in regard to the first two of these groups was evidently derived from their greater freedom, although the difference is only one in degree and not in kind. In fact, the villein is assumed to be a person free by birth, but holding land of which he cannot dispose freely. The distinction as against bordarii and cottagers is based on the size of the holding; the villeins are holders of regular shares in the village—that is, of the virgates, bovates or half-hides which constitute the principal subdivisions in the fields and contribute to form the plough-teams; whereas the bordarii hold smaller plots of some 5 acres, more or less, and cotarii are connected with mere cottages and crofts. Thus the terminology of Domesday takes note of two kinds of differences in the status of rustics: a legal one in connection with the right to dispose of property in land, and an economic one reflecting the opposition between the holders of shares in the fields and the holders of auxiliary tenements. The feature of personal servitude is also noticeable, but it provides a more extensive foundation for the division of the tenants, for only about 25,000 are enumerated in Domesday Book.

The contrast between this exceptionally situated class and the rest of the population shows that personal slavery was rapidly disappearing in England about the time of the Conquest. It is also to be noticed that the Domesday Survey constantly mentions the terra villanorum as opposed to the demesne in the estates or manors of the time, and that the land of the rustics is taxed separately for the geld, so that the distinction between the property of the lord and that of the peasant dependent on him is clearly marked and of practical importance.

The Domesday Survey points to the vital importance of England as it was at the very beginning of the Norman and at the close of the Saxon period. The development of feudal society, of centralizing kingship and ultimately of a system of common law, brought about great changes which all hinge on the fundamental fact that the kings, while increasing the power of the state in other respects, surrendered it completely as regards the relations between the peasants and their lords. The protection of the assizes was tendered in civil matters to free tenants and refused to villeins. The royal courts refused to entertain suits of villeins against their lords, although there was a good deal of vacillation before this position was definitely taken up. Bracton still speaks in his treatise of the possibility for the courts to interfere against intolerable cruelty on the part of the lord involving the destruction of the villein's waynage, that is, of his ploughteam, and in the Notebook of Bracton there are a couple of cases which prove that 13th-century judges occasionally allowed themselves to entertain actions by persons holding in villeinage against their lords. Gradually, however, the exception of villeinage became firmly settled. As the historical and practical position was developing on these lines, the lawyers who fashioned English common law in the 12th and 13th centuries did not hesitate to apply to it the teaching of Roman law on slavery. Bracton fits his definition of villeinage into the Romanscean scheme of Azo's Summa of the Institutes, and the judges of the royal courts made sweeping inferences from this general position. To begin with, the relation between the villein and his lord was regarded as a personal and not a praelial one. Everyone born of villein stock belonged to his master and was bound to undertake any service which might be imposed on him by the master's or the steward's command. The distinction between villeins in gross and villeins regarded as of which much is made by modern writers, was suggested by modes of pleading and does not make its appearance in the Year-Books before the 15th century. Secondly, all independent proprietary rights were denied to the villein as against his lord, and the legal rule "quia quicquid servio acquiritur domino acquiritur" was extended to villeins. The fact that a great number of these serfs had been enjoying protection as free ceorls in former ages made itself felt, however, in three directions: (1) In criminal matters the villein was treated by the King's Court irrespective of any consideration as to his debased condition. More especially the police association, organized for the keeping of the peace and the presentation of criminals—the frankpledge groups were formed of all "worthy of were and wise," villeins as well as freemen. (2) Politically the villeins were not eliminated from the body of citizens: they had to pay taxes, to serve in great emergencies in the militia, to serve on inquests, &c., and although there was a tendency to place them on a lower footing in all these respects yet the fact of their being lesser members of the commonwealth did not remove the fundamental
qualification of citizenship. (3) Even in civil matters villeins were deemed free as regards third persons. They could sue and be sued in their own name, and although they were able to call in their lords as defendants when proceeded against, there was nothing in law to prevent them from appearing in their own right. The state even afforded them protection against extreme cruelty on the part of their masters in respect of life and limb, but in laying down this rule English lawyers were able to follow the precedents set by late Roman jurisprudence, especially by measures of Hadrian, Antonine and Constantine the Great.

There was one exception to this harsh treatment of villeins, namely, the rustic tenantry in manors of ancient demesne, that is, in estates which had belonged to the crown before the Conquest, had a standing-ground even against their lords as regards the tenure of their plots and the fixity of their services. Technically this right was limited to the inhabitants of manors entered in the Domesday Survey as terra regis of Edward the Confessor. On the other hand the doctrine became effective if the manors in question had been granted by later kings to subjects, because if they remained in the hand of the king the only remedy against ejectment and execation lay in petitioning for redress without any definite right to the latter. If, however, the two conditions mentioned were forthcoming, villeins, or, as they were technically called, villein somen of ancient demesne manors, could resist any attempt of their lords to encroach on their rights by depriving them of their holdings or increasing the amount of their customary services. Their remedy was to apply for a little writ of right in the first case and for a writ of monstrotrum in the second. These writs enabled them to appear as plaintiffs against the lord in his own manorial court and, eventually, to have the question at issue examined by way of appeal, on a writ of error, or by reservation on some legal points in the upper courts of the king. A number of cases arising from these privileges of the men of ancient demesne are published in the Notebook of Bracton and in the Abbreviatio plactiorum. This exceptional procedure does not simply go back to the rule that persons who had been tenants of the king ought not to have their condition altered for the worse in consequence of a royal grant. If this were the only doctrine applicable in the case there would be no reason why similar protection should be denied to all those who held under grantees of manors escheated after the Conquest. A material point for the application of the privilege consists in the fact that ancient demesne has to be proved from the time before the Conquest, and this shows clearly that the theory was partly derived from the recognition of tenant right in villeins of the Anglo-Saxon period who, as we have said above, were mostly freemen, that is, freeborn men.

In view of the great difference in the legal position of the free man and of the villein in feudal common law, it became very important to define the exact nature of the conditions on which the status of a villein depended. The legal theory as to these conditions was somewhat complex, because it had to take account of certain practical considerations and of a rather abrupt transition from a previous state of things based on different premises. Of course, persons born from villein parents in lawful wedlock were villeins, but as to the condition of illegitimate children there was a good deal of hesitation. There was a tendency to apply the rule that a bastard follows the mother, especially in the case of villeile women. In the case of mixed marriages, the condition of the child is determined by the free or villein condition of the tenement in which it was born. This notion of the influence of the tenement is well adapted to feudal notions and makes itself felt again in the case of the pursuit of a fugitive villein. He can be seized without further formalities if he is caught in his "nest," that is, in his native place. If not, the lord can follow him in fresh pursuit for four days; once these days past, the fugitive is provisionally in possession of his liberty, and the lord has to bring an action de nativo habendo and has to assume the burden of proof.

So much as to the proof of villeinage by birth or previous condition. But there were numbers of cases when the discussion as to servile status turned not on these formal points but on an examination of the services performed by the person claimed as a villein or challenged as holding in villeinage. In both cases the courts had often recourse to proof derived not from direct testimony but from indirect indications as to the kind of services that had been performed by the supposed villein. Certain services, especially the payment of merchandise, were considered to be the badge of serfdom. Another service, the performance of which established a presumption as to villeinage, was compulsory service as a reeve. The courts also tried to draw a distinction from the amount and regularity of agricultural services to which a tenant was subjected. Bracton speaks of the contrast between the irregular services of a serf, "who could not know in the evening what he would have to do in the morning," and services agreed upon and definite in their amount. The customary arrangements of the work of villeins, however, render this contrast rather fictitious. The obligations of downright villeins became to that degree settled and regular that one of the ordinary designations of the class was castamarii. Therefore in most cases there were no arbitrary exactions to go by, except perhaps one or the other tallage imposed at the will of the lord. The original distinction seems to have been made not between arbitrary and agreed but between occasional services and regular agricultural work-week. While the occasional services, even when agricultural, in no way established a presumption of villeinage, and many serfs, freemen and holders by serjeancy submitted to them, agricultural work-week was primarily considered as a trait of villeinage and must have played an important part in the process of classification of early Norman society. The villein was in this sense emphatically the man holding "by the fork and the flail."

This point brings us to consider the matter-of-facts condition of the villeins during the feudal period, especially in the 12th, 13th and 14th centuries. As is shown by the Hundred Rolls, the Domesday of St Paul, the Surveys of St Peter, Gloucester Abbey, Ramsey Abbey and countless other records of the same kind, the customary conditions of villeinage did not tally by any means with the identification between villeinage and slavery suggested by the jurists. It is true that in nomenclature the word "servi" is not infrequently used (e.g. in the Hundred Rolls) where villani might have been mentioned, and the feminine nief (neltie) appears as the regular parallel of villanus, but in the descriptions of usages and services we find that the power of the lord loses its discretionary character and is in every respect moderated by custom. As personal dependents of the lord native villeins were liable to be sold, and were, actual sales recorded: Glastonbury Abbey says: sell a certain Philipp Hardynge for 20 shillings. But such transfers of human chattels occur seldom, and there is nothing during the English feudal period corresponding to the brisk trade in men characteristic of the ancient world. Merchel was regarded, as has been stated already, as a badge of serfdom in so far as it was said to imply a "buying of one's own blood" (serus de sanguine suo emando). The explanation is even more characteristic than the custom itself, because fines on marriage may be levied and were actually levied from people of different condition, from the king of the Saxons up to the serf who married a serf. Still the tendency to treat mercel as a distinctive feature of serfdom has to be noted, and we find that the custom spread for this very reason in consequence of the encroachments of powerful lords: in the Hundred Rolls it is applied indiscriminately to the whole rustic population of certain hundreds in a way which can hardly be explained unless by artificial extension. Iteriol, the surrender of the best horse or ox, is also considered as the common incident of villein tenure, although, of course, its very name proves its intimate connexion with the outfit of soldiers (here-goats).

Economically the institution of villeinage was bound up
VILLENAGE

with the manorial organization—that is, with the fact that the country was divided into a number of districts in which central
home farms were cultivated by the help of work supplied by
vilin households.

The most important of vilin services is the week-work per-
formed by the peasantry. Every virger or holder of a bovate
does to send a labourer to do work on the lord's farm for some days
in the week. Three days is indeed the most common standard
for service of this kind, though four or even five occur some-
times, as well as two. It must be borne in mind in the case of heavy
charge, that as four or five days' work would, only one
labourer from the whole holding is meant, while generally there
were many men living on every holding—otherwise the service
of five days would be impossible to perform. In the course of
these three days, or whatever the number was, many require-
ments of the demesne had to be met. The principal of these
was ploughing the fields belonging to the lord, and for such
ploughing the peasant had not only to appear personally as a
labourer, but to bring his oxen and plough, or rather to join with
his oxen and plough in the work imposed on the village: the
beast, costly, expensive with meat and drink, was given to
every day by several peasants contributing their beasts and implements
for the work. In the way the villages had to go through the work of harrowing with their harrows, and of
removing the harvest in their vats and carts. Carriage duties
in carts and on horseback were also apportioned according to the
time they took as a part of the week-work. Then came
innumerable varieties of manual work for the erection and
keeping up of hedges, the preservation of dykes, canals and
ditches, the threshing and garnering of corn, the tending and shearing of sheep and so forth. All this hand-work was reckoned
according to customary standards as day-work and week-work.
But besides all these services into which the regular week-work
of the peasantry was differentiated, stood some additional duties.
The ploughing for the lord, for instance, was not only imposed
in the shape of a certain number of days in the week, but took
sometimes the shape of a certain number of acres which the
village had to plough and to sow for the lord irrespectively of the
time employed on it. This was sometimes termed
gefolerk. Exceedingly burdensome services were required in the
seasons when farming processes are, as it were, at their height,—in the season of mowing and reaping, when every day is
of special value and the working power of the farm hands is
strained to the utmost. At that time it was the custom to call
up the whole able-bodied population of the manor, with the
exception of the housewives for two, three or more days of
mowing and reaping on the lord's fields; to these boon-works
the peasantry was asked or invited by special summons, and
their value was so far appreciated that the villagers were
usually treated to meals in cases where they were again and
again called off from their own fields to the demesne. The
liberality of the lord actually went so far, in exceptionally hard
straits, that some ale was served to the labourers to keep them in
good humour.

In the 14th century this social arrangement, based primarily
on natural economy and on the feudal disruption of society, began
to give way. The gradual spread of intercourse rendered un-
necessary the natural husbandry of former times which sought
to produce a complete set of goods in every separate locality.
Instead of acting as a little world by itself for the raising of corn,
the breeding of cattle, the gathering of wool, the weaving of
linen and common cloths, the fabrication of necessary imple-
ments of all kinds, the local group began to buy some of these
goods and to sell some others, renouncing isolation and making
its destiny dependent on commercial intercourse. Instead of
requiring from its population all kinds of work and reducing
its ordinary occupations to a hard-and-fast routine meeting
in a slow and unskilled manner all possible contingencies, the
local group began to move, to call in workmen from abroad for
tasks of a special nature, and to send its own workmen to
look out for profitable employment in other places. Instead of
managing the land by the constant repetition of the same
processes, by a customary immobility of tenure and service, by
communalistic restrictions on private enterprise and will, local
society began to try improvements, to escape from the bounds of
champion farming. Instead of producing and collecting
services, goods for immediate consumption, local society came more and
more into the habit of exchanging corn, cattle, cloth, for money,
and of laying money by as a means of getting all sorts of
exchangeable goods, when required. In a word, the time of
commercial, contractual, cash intercourse was coming fast. What
was exceptional and local at times came to obtain
general recognition in the course of the 14th and 15th centuries.
and, for this very reason, assumed a very different aspect.
A similar transformation took place in regard to government.
The local monarchy of the manorial lords was fast giving way to a
central power which maintained its laws, the circuits of its
judges, the fiscal claims of its exchequer, the police interference
of its civil officers all through the country, and, by prevailing
over the franchises of manorial lords, gave shape to a vast
domain of legal equality and legal protection, in which the
forces of commercial exchange, of contract, of social intercourse,
and, to some extent, and welcome sphere of acts and
transactions. In the course of these processes, the economic and the political one, worked so much
together that it is hardly possible to say which influenced
the other more, which was the cause and which the effect.
Government grew strong because it could draw on a society
which was going ahead in enterprise and well-being; social
intercourse progressed because it could depend on a strong
government to safeguard it.

If we now turn to the actual stages by which this momentous
passage from the manorial to the commercial arrangement was
achieved, we have to notice first of all a rapid development of
contractual relations. We know that in feudal law there ran a
standing contrast between tenure by custom—vilin tenure—and
tenure by contract—free tenure. While the manorial system was
in full force this contrast led to a classification of holdings and
affected the whole position of people on the land. Still, even at
that time it might happen that a freeholder owned some land
in vilinage by the side of his free tenement, and that a vilin
held some land freely by agreement with his lord or with a
third person. But these cases, though by no means infrequent,
were still exceptional. As a rule people used land as holdings,
and these were rigorously classified as of or free tenure. In this
interest point to be noticed is that, without any formal break,
leasing land for life and for term of years is seen to be rapidly
spreading from the end of the 13th century, and numberless small
tenancies are created in the 14th century which break up the
disposition of the holdings. From the close of the 13th century
downwards countless transactions on the basis of leases for terms
of years occur between the peasants themselves, any suit-
able set of 14th-century court rolls contains entries in
which such and such a vilin is said to appear in the haltitie
and to surrender for the use of another person named a piece of
land belonging to the holding. The number of years and the
conditions of payment are specified. Thus, behind the screen
of the normal shares a number of small tenancies arise which run
their economic concerns independently from the cumbersome
arrangements of tenure and service, and, needless to add, all these
tenancies are burdened with money rents.

Another series of momentous changes took place in the
arrangement of services. Even the manorial system admitted
the buying off for money of particular dues in kind and of
specific performance of work. A vilin might be allowed
to bring a penny instead of bringing a chicken or to pay a rent
instead of appearing with his oxen three times a week on the
lord's fields. Such rents were called mal or mail in contrast with the
gof, ancient rents which had been imposed inde-
pendently, apart from any buying off of customary services.
There were even whole bodies of peasants called Molmen, because
they had bought off work from the lord by settling with him
on the basis of money rents. As time went on these practices of
commutation became more and more frequent. There were,
for both sides, many advantages in arranging their mutual
relations on this basis. The lord, instead of clumsy work, got clear money, a much-coveted means of satisfying needs and wishes of any kind—instead of clumsy performances which did not come always at the proper moment, were carried out in a half-hearted manner, yielded no immediate results, and did not admit of convenient rearrangement. The peasant got rid of a hateful drudgery which not only took up his time and means in an unprofitable manner, but placed him under the rough control and the arbitrary discipline of stewards or reeves and gave occasion to all sorts of fines and extortions.

With the growth of intercourse and security money became more frequent and the number of such transactions increased in proportion. But it must be kept in mind that the conversion of services into rents went on very gradually, as a series of private agreements, and that it would be very wrong to suppose, as some scholars have done, that it had led to a general commutation by the middle or even the end of the 14th century. The 14th century was marked by frequent fluctuations in the demand and supply of labour, and particularly the tremendous loss in population occasioned in the middle of this century by the Black Death called forth a most serious crisis. No wonder that many lords clung very tenaciously to customary services, and ecclesiastical institutions seem to have been especially backward in going over to the system of money rents. There is evidence to show, for instance, that the manors of the abbey of Ramsey were managed on the system of enforced labour right down to the middle of the 14th century, and, of course, survivals of these customs in the shape of scattered services lived on much longer. A second drawback from the point of view of the landlords was called forth by the fact that commutation for fixed rents gradually lessened the value of the exactions to which they were entitled. Money not only became less scarce but it became cheaper, so that the couple of pence for which a day of manual work was bought off in the beginning of the 13th century did not fetch more than half of their former value at its end. As quit rents were customary and not rack rents, the successors of those who had redeemed their services were gaining the whole surplus in the value of goods and labour as against money, while the successors of those who had commuted their right to claim services for certain sums in money lost all the corresponding difference. These inevitable consequences came to be perceived in course of time and occasioned a backward tendency to services in kind which could not prevail against the general movement from natural economy to money dealings, but was strong enough to produce social friction and grave disturbances.

The economic crisis of the 14th century has its complement in the legal crisis of the 15th. At that time the courts of law begin to do away with the denial of protection to villeins which, as we have seen, constituted the legal basis of villenage. This is effected by the recognition of copyhold tenure (see Copyhold).

It is a fact of first-rate magnitude that in the 15th century customary relations on one hand, the power of government on the other, ripened, as it were, to that extent that the judges of the king began to take cognizance of the relations of the peasants to their lords. The first cases which occur in this sense are still treated not as a matter of common law, but as a manifestation of equity. As doubtful questions of trust, of wardship, of testamentary succession, they were taken up not in the strict course of justice, but as matters in which redress was sorely needed and had to be brought by the exceptional power of the court of chancery. But this interference of 15th-century chancellors paved the way towards one of the greatest revolutions in the law; without formally enfranchising villeins and villenage they created a legal basis for it in the law of the realm: in the formula of copyhold—tenementi held at the will of the lord and by the consent of the manor—in the first part lost its significance and the second prevailed, in due right contrast with former times when, on the contrary, the second part had no legal value and the first expressed the view of the courts. One may almost be tempted to say that these obscure decisions rendered unnecessary in England the work achieved with such a flourish of trumpets in France by the emaniciping decree of the 4th of August 1789.

The personal condition of villenage did not, however, disappear at once with the rise of copyhold. It lingered through the 16th century and appears exceptionally even in the 17th. Portions of enfranchisements for personal enfranchisement are often noticed at that very time. But these are only survivals of an arrangement which has been destroyed in its essence by a complete change of economic and political conditions.

command in November. On the 17th of January 1805 he left Toulon for the first time, but was driven back by a squall which dismantled some of his awkwardly handled ships. On the 3rd of March he was out again, and this time he headed Nelson by some weeks on a cruise to the West Indies. But Villeneuve's success so far had not removed his fears. Though on taking up his command he had issued an order of the day in which he spoke boldly enough of the purpose of his cruise, and his determination to adhere to it, he was racked by fears of what might happen to the force entrusted to his care. For the details of the campaign see Trafalgar. In so far as the personal biography of Villeneuve is concerned, his behaviour during these trying months cannot escape condemnation. He had undertaken to carry out a plan of which he did not approve. Since he had not declined the task altogether, it was clearly his duty to execute his orders at all hazards. If he was defeated, as he almost certainly would have been, he could have left the responsibility for the disaster to rest on the shoulders of Napoleon who assigned him the task. But Villeneuve could not free himself from the conviction that it was his business to save his fleet even if he had to fight his way through to the safety of British lines. When he returned to Europe and fought his confused action with Sir R. Calder off Ferrol on the 22nd of July 1805, he first hesitated, and then, in spic of vehement orders to come on, turned south to Cadiz. Napoleon's habit of suggesting alternative courses to his lieutenants gave him a vague appearance of excuse for making for that port. But it was one which only a very weak man would have availed himself of, for all his instructions ought to have been read subject to the standing injunction to come on to the Channel—and in turning south to Cadiz, he was going in the opposite direction. His decision to leave Cadiz and give battle in October 1805, which led directly to the battle of Trafalgar, cannot be justified even on his own principles. He foresaw defeat to be inevitable, and yet he went out solely because he learnt from the Minister of Marine that another officer had been sent to supersede him. In fact he ran to meet the very destruction he had tried to avoid. No worse fate would have befallen him in the Channel than came upon him at Trafalgar, but it might have been incurred in a manly attempt to obey his orders. It was provoked in a spasm of wounded vanity. At Trafalgar he showed personal courage, but the helpless incapacity of the allies to manœuvre gave him no opportunity to influence the course of the battle. He was taken as a prisoner to England, but was soon released. Shortly after landing in France he committed suicide in an inn at Rennes, on the 22nd of April 1806. Among the other improbable crimes attributed to Napoleon by the fear and hatred of Europe, was the murder of Villeneuve, but there is not the faintest reason to doubt that the admiral died by his own hand.

The correspondence of Napoleon contains many references to Villeneuve. Accounts of the naval operations in which he was concerned will be found in James's Naval History. Trouble, in his Batailles navales de la France, vol. iii., publishes several of his letters and orders of the day.

VILLENUEVE-LÈS-AVIGNON—VILLEROI

VILLENUEVE-LÈS-AVIGNON, a town of south-eastern France, in the department of Gard on the right bank of the Rhone opposite Avignon, with which it is connected by a suspension bridge. Pop. (1906) 23,522. Villeneuve preserves many remains of its medieval importance. The church of Notre Dame, dating from the 14th century, contains a rich marble altar and remarkable pictures. The hospice, once a Franciscan convent, part of which now forms the museum of pictures and antiquities, has a chapel in which is the fine tomb of Innocent VI. (d. 1632). The church and other remains of the Carthusian monastery of Val-de-Bénédicton, founded in 1356 by Innocent VI., are now used for habitation and other secular purposes. A gateway and a rotunda, built as shelter for a fountain, both dating from about 1670, are of architectural note. On the Mont Andao, a hill to the north-east of the town, stands the Fort of St André (14th century), which is entered by an imposing fortified gateway and contains a Romanesque chapel and remains of the abbey of St André. The other buildings of interest include several old mansions once belonging to cardinals and nobles, and a tower, the Tour de Philippe le Bel, built in the 14th century, which guarded the western extremity of the Pont St Bénézet (see AVIGNON).

In the 6th century the Benedictine abbey of St André was founded on Mount Andao, and the village which grew up round it took its name. In the 13th century the monks, acting in concert with the crown, established a bastide, or "new town," which came to be called Villeneuve. The town was the resort of French cardinals during the sojourn of the popes at Avignon. Though largely to its numerous religious establishments, it did not decline till the Revolution.

VILLENUEVE-SUR-LOT, a town of south-western France, capital of an arrondissement in the department of Lot-et-Garonne, 22 m. N. by E. of Agen on a branch line of the Orleans railway. Pop. (1906) town, 6,978; commune, 13,540. Villeneuve is divided into two unequal portions by the river Lot, which here runs between high banks. The chief quarter stands on the right bank and is united to the quarter on the left bank by a bridge of the 13th century, the principal arch of which, commonly called the Pont du Diable, in English is the Devil's bridge. It has a span of 18 ft. and a height of 59 ft. On the left bank portions of the 13th century ramparts, altered and surmounted by machicolations in the 15th century, remain, and high square towers rise above the gates to the north-east and south-west, known respectively as the Porte de Paris and Porte de Pujois. On the right bank boulevards have for the most part taken the place of the ramparts. Arcades of the 13th century surround the Place La Fayette, and old houses of the 13th, 14th and 15th centuries are to be seen in various parts of the town. The church of St Etienne is in late Gothic style. In the left bank of the Lot, 2 m. S.S.W. of Villeneuve, are the 13th-century walls of Pujois. The buildings of the ancient abbey of Eysse, about a mile to the N.E., which are mainly of the 17th century, serve as a departmental prison and penitentiary settlement. The principal hospital, the hospice St Cyr, is a handsome building standing in beautiful gardens. Villeneuve has a sub-prefecture, tribunals of first instance and of commerce and communal colleges for both sexes. It is an important agricultural centre and has a very large trade in plums (prunes d'entres) and in the produce of the market gardens which surround it, as well as in cattle, horses and wine. The preparation of preserved plums and the tinning of peas and beans occupy many hands; there are also manufactures of boots and shoes and tin boxes. The important mill of Gajac stands on the bank of the Lot a little above the town.

Villeneuve was founded in 1254 by Alphonse, count of Poitiers, brother of Louis IX., on the site of the town of Gajac, which had been deserted during the Albigensian crusade.

VILEROI, FRANCOIS DE NEUVILLE, DUC DE (1644–1730), French soldier, came of a noble family which had risen into prominence in the reign of Charles IX. His father Nicolas de Neuville, Marquis de Villeroi, marshal of France (1598–1685), created a duke by Louis XIV., was the young king's governor, and the boy was thus brought up in close relations with Louis. An intimate of the king, a finished courtier and leader of society and a man of great personal gallantry, Villeroi was marked out for advancement in the army, which he loved, but which had always a juster appreciation of his incapacity than Louis. In 1693, without having exercised any really important and responsible command, he was made a marshal. In 1695, when Louis XIV. died, he obtained the command of the army in Flanders, and William III. found him a far more compliant opponent than the "little hunchback." In 1701 he was sent to Italy to supersede Catinat and was soon beaten by the inferior army of Eugene at Chiari (see Spanish Succession War). In the winter of 1701 he was made prisoner at the surprise of Cremona, and the wits of the army made at his expense the famous rhyme:

"Par la faveur de Bellone, et par un bonheur sans égal,
Nous avons conservé Crémone — et perdu notre général."

In the following years he was pitted against Marlborough in
the Low Countries. Marlborough's own difficulties with the Dutch and other allied commissioners, rather than Villeroi's own skill, put off the inevitable disaster for some years, but in 1766 the duke attacked him and thoroughly defeated him at Ramillies (q.v.). Louis consolde his old friend with the remark, "At our age, one is no longer lucky," but superseded him in the command, and henceforward Villeroi lived the life of a courtier, much busied with intrigues but retaining to the end the friendship of his master. He died on the 18th of July, 1774, at Charleroi.

**VILLERS LA VILLE.** A town of Belgium in the province of Brabant, 2 m. E. of Quatre Bras, with a station on the direct line from Louvain to Charleroi. Pop. (1904) 1166. It is chiefly interesting on account of the fine ruins of the Cistercian abbey of Villers founded in 1147 and destroyed by the French republicans in 1795. In the ruined church attached to the abbey are still to be seen the tombstones of several dukes of Brabant of the 13th and 14th centuries.

**VILLETTE, CHARLES, MARQUIS DE** (1736-1793). French writer and politician, was born in Paris on the 4th of December 1736, the son of a financier who left his son a large fortune and the title of marquis. After taking part in the Seven Years' War, young Villette returned in 1763 to Paris, where he made many enemies by his insufferable manners. But he succeeded in gaining the intimacy of Voltaire, who had known his mother and who wished to make a poet of him. The old philosopher even went so far as to call his prodigy the French Tibullus. In 1777, on Voltaire's advice, Villette married Madeamoiselle de Varicourt, but the marriage was unhappy, and his wife was subsequently adopted by Voltaire's niece, Madame Denis. During the Revolution Villette publicly burned his letters of nobility, wrote revolutionary articles in the *Chronique de Paris*, and was elected deputy to the Convention by the department of Seine-et-Oise. He had the courage to censure the September massacres and to vote for the imprisonment only, and not for the death, of Louis XVI. He died in Paris on the 7th of July 1793.

In 1784 he published his *Oeuvres*, which are of little value, and in 1792 his articles in the *Chronique de Paris* appeared in book form under the title *Lettres choisies sur les principaux événements de la Révolution*.

**VILLIERS, CHARLES PELHAM** (1802-1898), English statesman, son of George Villiers, grandson of the 1st earl of Clarendon of the second (Villiers) creation, and brother of the 4th earl (q.v.), was born in London on the 3rd of January 1802, and educated at St John's College, Cambridge. He read for the bar at Lincoln's Inn, and became an associate of the Benthamites and "philosophical radicals" of the day. He was an assistant commissioner to the Poor Law Commission (1834), and in 1835 was made by the master of the Rolls, whose secretary he had been, a chancery examiner of witnesses, holding this office till 1832. In 1835 he was elected M.P. for Wolverhampton, and retained his seat till his death. He was the pioneer of the free-trade movement, and became prominent with Cobden and Bright as one of its chief supporters, being indefatigable in pressing the need for free trade on the House of Commons, by resolution and by petition. After free trade triumphed in 1846 his importance in politics became rather historical than actual, especially as he advanced to a venerable old age; but he was president of the Poor Law Board, with a seat in the Cabinet, from 1859 to 1866, and he did other useful work in the Liberal reforms of the time. Like Bright, he parted from Mr Gladstone on Home Rule for Ireland. He attended parliament for the last time in 1895, and died on the 16th of January 1898.

**VILLIERS DE L'ISLE-ADAM, PHILIPPE AUGUSTE MATHIAS, COMTE DE** (1838-1889), French poet, was born at St Brieuc in Brittany and baptized on the 28th of November 1838. He may be said to have inaugurated the Symbolist movement in French literature, and *Astarte*, the play on which he was engaged during so much of his life, though it was only published after his death, is the typical Symbolist drama. He began with a volume of *Premières Poésies* (1856-58). This was followed by a wild romance of the supernatural, *Iris* (1862), and by two plays in prose, *Eléna* (1866) and *Morgane* (1866).

*La Rêvolte*, a play in which Ibsen's "Doll's House" seems to be anticipated, was represented at the Vaudeville in 1870; *Contes cruels*, his finest volume of short stories, in 1883, and a new series in 1880; *Le Nouveau Monde*, a drama in five acts, in 1880; *L'Éve future*, an amazing piece of buffoonery satirizing the pretensions of science, in 1886; *Tribunal Bouhombet* in 1887; *Le Secret de l'échauffaud* in 1888; *Astar* in 1890. He died in Paris, on the 25th of March 1895, while on a visit to St-Jean-de-Dieu, on the 19th of August 1890. Villiers has left behind him a legacy, perhaps not more fantastic than the truth. Sharing many of the opinions of Don Quixote, he shared also Don Quixote's life. He was the descendant of a Grand Master of the Knights of Malta, famous in history, and his pride as an aristocrat and as an idealist were equal. He hated mediocrity, science, progress, the present age, money and "serious" people. In one division of his work he attacked all the things which he hated with a savage irony; in another division of his work he discovered at least some glimpses of the ideal world. He remained a carpenter and a trade unionist, though he was a man of refinement.

He improvised out of an abundant genius, but the greater part of his work was no more than improvisation. He was accustomed to talk his stories before he wrote them. Sometimes he talked them instead of writing them. But he has left, at all events, the *Contes cruels*, in which may be found every classic quality of the French conte, together with many of the qualities of Edgar Allan Poe and Ernst Hoffmann; and the drama of *Astar*, in which the stage takes a new splendour and a new subtility of meaning.

Villiers's influence on the younger French writers was considerable. It was always an exaltation. No one in his time followed a literary ideal more romantically. (A. SY.)

See also R. du Pontavice de Hessey, Villiers de l'Isle-Adam (1893), a biography, English trans. (1904) by Lady Mary Loyd; S. Vanvick, *Les Mécènes de la France, 1720-1760*, 3 vols. (1904), and *O Score of Mademoiselle*, Un vivant et deux morts (1901), bibliography. A selection from his stories, *Histoires sourvainee*, was made by his friends (Brussels, 1899).

**VILLENGEN.** A town of Germany in the grand duchy of Baden, pleasantly situated amid well-wooded hills, 52 m. by rail N. of Schaffhausen. Pop. (1905) 9582. It is in part still surrounded by walls, with ancient gate towers. It is the chief seat of the watch-making industry of the Black Forest. It also produces musical-boxes, glass and silk, and has a Gothic church of the 13th century and another of the 11th, a 13th-century town hall, with a museum of antiquities, and music, technical and agricultural schools.

**VILLOISON, JEAN BAPTISTE GASPARD D'ANSSE (or D'ANSSE) DE** (1750-1853), French classical scholar, was born at Corbeil-sur-Seine on the 5th of March 1750 (or 1753; authorities differ). He belonged to a noble family (De Ansse) of Spanish origin, and took his surname from a village in the neighbourhood. In 1773 he published the Homeric Lexicon of Apollonius from a MS. in the abbey of Saint Germain des Prés. In 1778 appeared his edition of Longus's *Daphnis and Chloe*. In 1781 he went to Venice, where he spent three years in examining the library, his expenses being paid by the French government. His chief discovery was a 10th-century MS. of the *Iliad*, with ancient scholia and marginal notes, indicating suppositional, corrupt or transposed verses. After leaving Venice, he accepted the invitation of the duke of Saxe-Weimar to his court. Some of the fruits of his researches in the library of the palace were collected into a volume *Epitolaes Vinariensiues, 1783*, dedicated to his royal hosts. Hoping to find a treasure similar to the Venetian Homer in Greece, he returned to Paris to prepare for a journey to the East. He visited Constantinople, Smyrna, the Greek islands, and Mount Athos, but the results did not come up to his expectation. In 1786 he returned, and in 1788 brought out the Codex Venetus of Homer, which created a sensation in the learned world. When the revolution broke out, being banished from Paris, he lived in retirement at Orléans, occupying himself chiefly with the transcription of the notes
in the library of the brothers Valois (Valesius). On the restora-
tion of order, having returned to haveing, he accepted the pro-
fessorship of modern Greek acknowledged by the government,
and held it until it was transferred to the Collège de France
as the professorship of ancient and modern Greek languages.
He died soon after his appointment, on the 25th of April 1865.

Another work of some importance, Anecdola Graeca (1781),
from the Paris and Venice libraries, contains the (Tonia (violet
the garden) of the empress Eudocia, and several fragments of
Ambilichus, Porphyry, Procopius of Gaza, Choricius and the
Greek grammarians. Materials for an exhaustive work con-
templated by him on ancient and modern Greece are preserved
in the royal library of Paris.

See J. Ducier, Notice historique sur la vie et les ouvrages de
Villot (1500); Chardon de la Rochette, Milanges de critique et
de philologie, iii. (1872); and especially the article by his friend
and pupil E. Quatremère in Nouvelle biographie générale, xii., based
upon private information.

VILLON, FRANÇOIS (1431–c. 1463), French poet (whose real
surname is a matter of much dispute, so that he is also called
De Montcorbier and Des Loges and by other names, though
in literature Villon is the sole term used), was born in 1431, and,
as it seems, certainly at Paris. The singular poems called
25th of January in the Hie of Saint-Jacques, nothing
Taverniers, composed the usual, or not his only certain work,
are largely autobiographical, though of course not fully trust-
worthy. But his frequent collisions with the law have left
more certain records, which have of late been ransacked with
extraordinary care by students, especially by M. Longnon.
It appears that he was born of poor folk, that his father died
in his youth, but that his mother, for whom he wrote one of
his most famous ballades, was alive when her son was thirty
years old. The very name Villon was stated, and that by no
mean authority, the president Claude Fauchet, to be merely
an artificer, who had a priestly calling. His life was a rather
"rascal"; but this seems to be a mistake. It is, however,
certain that Villon was a person of loose life, and that he
continued, long after there was any excuse for it in his years,
the reckless way of living common among the wilder youth
of the university of Paris. He appears to have derived his
surname from a friend and benefactor named Guillaume de
Villon, chaplain in the collegiate church of Saint-Benoit-le-
Bestourné, and a professor of canon law, who took Villon into
his house. The poet became a student in arts, no doubt
early, perhaps at about twenty or more years of age, and took the
degree of bachelor in 1450 and that of master of arts in 1452. But this
year and 1453 nothing positive is known of him, except
that nothing was known against him. Attempts have been
made, in the usual fashion of conjectural biography, to fill up
the gap with what a young graduate of Bohemian tendencies
would, could, or might have done; but they are mainly futile.
On the 5th of June 1455 the first important incident of
his life that is known occurred. Being in the company of a
priest named Giles and a girl named Isabeau, he met, in the
rue Saint-Jacques, a certain Breton, Jean le Hardi, a master
of arts, who was with a priest, Philippe Chervoye or Sermaise
or Sermaise. A scuffle ensued; daggers were drawn; and
Sermaise, who is accused of having threatened and attacked
Villon and drawn the first blood, not only received a dagger-
thrust in return, but a blow from a stone which struck him
down. Sermaise died of his wounds. Villon fled, and was
sentenced to banishment—a sentence which was remitted in
January 1456, the formal pardon being extant, strangely
enough, in two different documents, in one of which the culprit
is described as "François des Loges, autrement dit Villon," in
the other as "Jean le Hardi." It is not said to have described himself to the barber-surgeon who
washed his wounds as Michel Mouton is less surprising, and
hardly needs an addition to the list of his aliases. It should,
however, be said that the documents relative to this affair
confirm the date of his birth, by representing him as twenty-
six years old or thereabouts. By the end of 1456 he was again
in trouble. In his first broil "la femme Isabeau" is only
generally named, and it is impossible to say whether she had
anything to do with the quarrel. In the second, Catherine
de Vaucelles, of whom we hear not a little in the poems, is the
declared cause of a scuffle in which Villon was so severely
beaten that, to escape ridicule, he fled to Angers, where he
had an uncle who was a monk. It was before leaving Paris
that he composed what is now known as the Petit testament,
of which we shall speak presently with the rest of his poems,
and which, it should be said, shows little or no such mark of
profound bitterness and regret for wasted life as does its in
every sense greater successor the Grand testament. Indeed,
Villon's serious troubles were only beginning, for neither
had hejsoned his banishment. At Christmas time of
the year the chapel of the college of Navarre was broken open, and
five hundred crowns stolen. The robbery was not dis-
covered till March 1457, and it was not till May that the police
came on the track of a gang of student-robbers owing to the
indiscretion of one of them, Guy Tabarie. A year more passed,
when Tabarie, being arrested, turned king's evidence and
accused Villon, who was then absent, of being the ring-leader,
and of having gone to Angers, partly at least, to arrange for
similar burglaries there. Villon, for this or some other crime,
was sentenced to banishment: and he did not attempt to return
to Paris. In fact for four years he was a wanderer; and he
may have been, as each of his friends Regnier de Montigny
and Colin des Cayeux certainly was, a member of a wandering
thieves' gang. It is certain that at one time (in 1457), and
probable that at more than one time, he was in correspondence
with Charles d'Orléans, and it is likely that he resided, at any
rate for some period, at that prince's court at Blois. He had
also something to do with another prince of the blood, Jean
of Bourbon, and traces are found of him in Poitou, in Dauphiné,
&c. But at his next certain appearance he is again in trouble.
The Carthusian who had spent the summer of 1456 in the bishop's
prison (bishops were still to Villon) of Meung. His crime is
not known, but is supposed to have been church-robbing;
and his enemy, or at least judge, was Thibault d'Aussigny,
who held the see of Orleans. Villon owed his release to a
general gaol-delivery at the accession of Louis XI., and became
a free man again on the 2nd of October.

It was now that he wrote the Grand testament, the work
which has immortalized him. Although he was only thirty
at the date (1461) of this composition (which is unmistakable,
because given in the book itself), there seems to be no kind
of aspiration towards a new nor even any hint of anything
in the old. Nothing appears to be left him but regret; his very
spirit has been worn out by excesses or sufferings or both.
Even his good intentions must have been feeble, for in the
autumn of 1462 we find him once more living in the cloisters
of Saint-Benoit, and in November he was in the Châtelet for
theft. In default of evidence the old charge of the college
of Navarre was revived, and even a royal pardon did not bar
the demand for restitution. Bail was, however, accepted,
but Villon fell promptly into a street quarrel, was arrested,
and brought before the council, and condemned to be hanged, but the sentence was
commuted to banishment by the parliament on the 5th of January
1463. The actual event is unknown: but from this time he
disappears from history. Rabelais indeed tells two stories
about him which have almost necessarily been dated later.
One is a countryside anecdote of a trick supposed to have
been played by the poet in his old age at Saint Maixent in
Poitou, whither he had retired. The other, a coarse but
pointed jest at the expense of England, is told as having been
addressed by Villon to King Edward V. during an exile in that
country. Now, even if King Edward V. were not evidently
out of the question, a passage of the story refers to the well-known
scholar and man of science, Thomas Linacre, as court physician
to the king, and makes Villon mention him, whereas Linacre
was only a young scholar, not merely at the time of Edward V.'s
supposed murder, but at the extreme date (1480) which can be
assigned to Villon's life. For in this year the first edition of
the poet's work appeared, obviously not published by himself,
VILNA, or Vilno, a Lithuanian government of West Russia, having the Polish government of Suwalki on the W., Kovno and Vitbsk on the N., and Minsk and Grodno on the E. and S. Area, 16,176 sq. m.; pop. (1906 estimate) 1,866,600. Vilno lies on the broad marshy swelling, dotted with lakes, which separates Poland from the province of East Prussia and stretches E-N. towards the Valdai Plateau.

Its highest parts are a little more than 1000 ft. above sea-level. Owing to this, the town, being on the banks of the valleys of the Niemen and the S. Divna, is chiefly built up of Lower tertiary deposits, but in the north Devonian sandstones appear on the surface. The tertiary deposits consist of Eocene clay, slates, sandstones, limestones and chalk, with gypsum, and are partly of marine and partly of terrane origin. The whole is overlain with thick layers of Glacial boulder clay and post-glacial deposits, containing remains of the mammath and other extinct mamals. Interesting discoveries of Neolithic implements, especially of polished stone, and of implements belonging to the Bronze Age and the early years of the Christian epoch, have been made in the excavations that have been carried on in Vilna, and are particularly remarkable because of the precision and clearness with which they have been preserved, as well as of the seclusion in which they were found. Much of the art and manners of the old inhabitants of this country is the subject of Vilna. The town descends in the case of the grecian literature and of the prehistoric and the best of the ancient, but the degradation of the ancient is still more noticeable in the decline of the Greco-Christian civilizations.

The city of the climate of the government is only slightly tempered by its proximity to the Baltic Sea (January, 21° 8'; July, 64° 3'); the average temperature at the town of Vilna is only 43° 5.3°. But in winter the thermometer descends very low, a minimum of 8° being not an unusual event. The flora and fauna are intermediate between those of Poland and middle Russia. The government is divided into seven districts, the chief towns of which are Vilna, Vilei, Disna, Lida, Oshmyany, Zvenzyants and Zviensky.

VILNA, or Vilno, a town of Russia, capital of the government of the same name, 436 1/2 s.s.w. of St. Petersburg, at the intersection of the railways from St. Petersburg to Warsaw and from Libau to the mouth of the Don. Pop. (1883) 93,760; (1900) 162,633. With its suburbs Antokol, Lukishki, Pogulanka and Sarechye, it stands on and around a knot of hills (245 ft.) at the confluence of the Vileika with the Vilja. Its streets are in part narrow and not very clean; but Vilna is an old town, rich in historical associations. Its imperial palace, and the cathedral of St Stanislaus (1537, restored 1861), containing the silver sarcophagus of St Casimir and the tomb of Prince Witoff, are fine buildings. There is a second cathedral, that of St Nicholas, built in 1556-1604; also several churches dating

and with no sign in it of his having lived later than the date (1461) of the Grand testament. It would be easy to dismiss these Rabelaisian mentions of Vilnon as mere humorous inventions, if it were not that the author of Pantagruel was born almost soon enough to have actually seen Vilnon if he had lived to anything that could be called old age, that he almost certainly must have known men who had known Vilnon, and that the poet undoubtedly spent much time in Rabelais's own country on the banks of the lower Loire.
from the 14th to the 16th centuries. The Ostra Brama chapel contains an image of the Virgin greatly venerated by Orthodox Greeks and Roman Catholics alike. The museum of antiquities has valuable historical collections. The ancient castle of the Jagellonians is now a mass of ruins. The old university, founded in 1578, was restored (1803) by Alexander I., but has been closed since 1832 for political reasons; the only departments which remain in activity are the astronomical observatory and a medical academy. Vilna is an archiepiscopal see of the Orthodox Greek Church and an episcopal see of the Roman Catholic Church, and the headquarters of the Lithuanian provincial command of the III. Army corps. The city possesses a botanical garden and a public library, and is adorned with statues to Catherine II. (1803), the poet Pushkin and Count M. Muraviev (1898). It is an important centre for trade in timber and grain, which are exported; and has theological seminaries, both Orthodox Greek and Roman Catholic, a military school, a normal school for teachers and professional schools. It is the seat of many scientific societies (geographical, medical and archaeological), and has a good antiquarian museum and a public library.

Partly the monastery of Vilna has been occupied by the Lithuanians since the 12th century, and probably much earlier; their chief fortified town, Vilna, is first mentioned in 1218. A temple to the god Perkunas stood on one of its hills till 1387, when it was destroyed by Prince Jagiello, after his baptism. After 1323, when Gedymyn, prince of Lithuania, abandoned Troki, Vilna became the capital of Lithuania. The formerly independent principalities of Minsk and Lidy, as well as the territory of Disna, which belonged to the Polotsk principality, were annexed by the Lithuanian princes, and from that time Vilna, which was fortified by a stone wall, became the chief city of the Lithuanian state. It was united with Poland when its prince, Casimir IV., was elected (1447) to the Polish throne. The plague of 1588, a fire in 1610 and still more the wars between Russia and Poland, which began in the 17th century, checked its further growth. The Russians took Vilna in 1655, and in the following year it was ceded to Russia. The Swedes captured it in 1702 and in 1706. The Russians again took possession of it in 1778, and it was finally annexed to Russia in 1795, after the partition of Poland. Its Polish inhabitants took an active part in the risings of 1831 and 1863, for which they were severely punished by the Russian government.

VILVORDE, a town of Belgium in the province of Brabant, 9 m. N. of Brussels and on the Sene. Pop. (1904) 14,418. The old castle of Vilvorde, which often gave shelter to the dukes of Brabant in their days of trouble, is now used as a prison. The younger Teniers lived and died at a farm outside Vilvorde, and is buried in the parish church of Dry Toren.

VINCENNES, a town of northern France, in the department of Seine, on a wooded plateau 14 m. E. of the fortifications of Paris, with which it is connected by rail and tram. Pop. (1906) 20,707; commune, 34,185. Its celebrated castle is situated to the south of the town and on the northern border of the Bois de Vincennes, was formerly a royal residence, begun by Louis VII. in 1164, and more than once rebuilt. It was frequently visited by Louis IX., who held informal tribunals in the neighbouring wood, a pyramid marking the spot where the oak under which he administered justice is said to have stood. The chapel, an imitation of the Sainte Chapelle at Paris, was begun by Charles V. in 1379, continued by Charles VI. and Francis I., consecrated in 1552 and restored in modern times. In the sacristy is the magnificent carved screen incorpo- rated the duke of Enguin, who was shot in the castle most in 1804. Louis XI. made the castle a state prison in which Henry of Navarre, the great Condé, Mirabeau and other distinguished persons were afterwards confined. Under Napoleon I. the castle became a magazine of war-material. Louis XVIII. added an armoured, and under Louis Philippe numerous case-mates and a new fort to the east of the donjon were constructed. The place now serves as a fort, arsenal and barracks. It forms a rectangle 417 yds. long by 245 yds. wide. The enclosing wall was originally flanked by nine towers, which were cut down to its level between 1808 and 1811, and now serve as bastions. The donjon is a square tower, 170 ft. high, with turrets at the corners. The Bois de Vincennes, which covers about 2300 acres and stretches to the right bank of the Marne, contains a race-course, a military training-ground, a school of military explosives (pyrotechnic), several artificial lakes, an artillery polygon and other military establishments, an experimental farm, the redoubts of Gravelle and La Faisanderie and the normal school of military gymnastics. The wood, which now ranks among the most famous in Europe, has been enlarged by the same measures as the Bois de Boulogne. On its south border is the asylum of Vincennes, founded in 1855 for the benefit of convalescents from the hospitals. In the town there is a statue of General Daumesnil, celebrated for his defense of the castle against the allies in 1814 and 1815. Vincennes has a school of military administration and carries on horticulture and the manufacture of ironware of various kinds, rubber goods, chemicals, perfumery, mineral waters, etc.

VINCENNES, a city and the county-seat of Knox county, Ind., U.S.A., on the Wabash river, about 47 m. S.W. of Indianapolis; on the bank of the Wabash river, about 17 m. S.W. of Indianapolis; (1809) 8853; (1900) 16,249; of whom 736 were foreign-born; (1910 census) 14,805. It is served by the Baltimore & Ohio South-Western, the Cleveland, Cincinnati, Chicago & St Louis, the Evansville & Terre Haute, and the Vandalia railways. Extensive levees, 15 m. in length, prevent the overflow of the Wabash river, which for nine months in the year is navigable from this point to the Ohio. The city is level and well drained, and has a good water-supply system. In Vincennes are a Roman Catholic cathedral, erected in 1835, one of the oldest in the west, occupying the site of a church built early in the 18th century; Vincennes University (1856), the oldest educational institution in the state, which in 1910 had 14 instructors and 236 students; St Rose Female Academy, and a public library. Coal, natural gas and oil are found near Vincennes. The city is a manufacturing and railway centre, and ships grain, pork and beef cattle. The total value of the factory products in 1905 was $817,279. Vincennes was the first permanent settlement in Indiana. On its site Francois Margareta, Sieur de Vincennes, established a French military post about 1731, and a permanent settlement was made about the fort in 1735. After the fall of Quebec the place remained under French sovereignty until 1777, when it was occupied by a British garrison. In 1778 an agent of George Rogers Clark took possession of the fort on behalf of Virginia, but it was soon afterwards again occupied by the British, who called it Fort Sackville and held it until February 1779, when it was besieged and was captured (on the 25th of February) by George Rogers Clark, and passed finally under American jurisdiction. The site of the fort is marked by a granite shaft erected in 1905 by the Daughters of the Revolution. Vincennes was the capital of Indiana Territory from 1800 to 1813, and was the most populous in 1805 of the first General Assembly of Indiana Territory. In 1839 it was incorporated as a borough, and it became a city in 1856.

See J. Law, The Colonial History of Vincennes (Vincennes, 1858); W. H. Smith, "Vincennes, the Key to the North-West," in L. P. Powell's Historic Towns of the Western States (New York, 1900); also chap. ii. of J. P. Dunn's Indiana (Boston, 1892).

VINCENT (or VICENTIUS), ST, deacon and martyr, whose festival is celebrated on the 22nd of January. In several cursas St Vincent is named as being the first person canonized for this martyr, and refers to Acts which were read in the church. It is doubtful whether the Acts that have come down to us (Acta Sanctorum, January, ii. 394-397) are those referred to by St Augustine, since it is not certain that they are a contemporary document. According to this account, Vincent was born of noble parents in Spain, and was educated by Valerius, bishop of Saragossa, who ordained him to the diaconate. Under the persecution of Diocletian, Vincent was arrested and taken to Valencia. Having stood firm in his profession before Dacianus,
the governor, he was subjected to excruciating tortures and thrown into prison, where angels visited him, lighting his dungeon with celestial light and relieving his sufferings. His warders, having seen these wonders through the chinks of the wall, forthwith became Christians. He was afterwards brought out and laid upon a soft mattress in order that he might regain sufficient strength for new torments; but, while Dacianus was meditating punishment, the saint gently breathed his last.

The tyrant exposed his body to wild beasts, but a raven made away with the animals and people of the Domincan province went into the sea, but was cast up on the shore, recovered by a pious woman and buried outside Valencia. Prudentius devoted one of his hymns (Peristeph. v.) to St Vincent, and St Augustine attests that in his lifetime the festival of the saint was celebrated throughout the Christian world (Serm. 276, n. 4).

VINCENT OF BEAUVAS, or VINCIENUS BELLAVACENSIS (c. 1160–c. 1264), the encyclopaedist of the middle ages, was probably a native of Beausais.1 The exact dates of his birth and death are unknown. A tolerably old tradition, preserved by Louis a Valloceleti (c. 1413), gives the latter as 1264;2 but Tholomaeus de Luca, Vincent’s younger contemporary (d. 1321), seems to reckon him as living during the pontificate of Gregory X. (1271–76). If we assume 1264 as the year of his death, the immense volume of his works forbids us to think he could have been born much later than 1190. Very little is known of his career. A plausible conjecture makes him enter the house of the Dominicans at Paris between 1215 and 1220, from which a second conjecture carries him to the Dominican province of the Rhine in the latter year. He returned to Paris in 1224, and after two years at the Sorbonne, he is said to have taught in the Sorbonne. His name appears among those who also taught there, in a roll of those who composed the De Institutione Principe—writing under the name of Theobald V. of Champagne and Navarre, among men who are very well known, but of whose composition no actual proof has been made. The work itself is a treatise on the art of rhetoric and debate, and it has been clearly shown to be the production of a later hand, and is ascribed by Echard to the period between 1310 and 1325.3 In arrangement and style it is quite different from the other three parts, and indeed it is mainly a compilation from Thomas Aquinas, Stephen de Bourbon, and two or three other contemporary writers.

The Speculum Naturae fills a bulky volume of 848 closely printed double-columned pages. It is divided into thirty-two books and 3718 chapters. It is a vast summary of all the natural history known to western Europe towards the middle of the 13th century. It is, as earlier writers have shown, an encyclopaedia, whose floor and walls are laid with an enormous mosaic of skilfully arranged passages from Latin, Greek, Arabic, and even Hebrew authors. To each quotation, as he borrows it, Vincent prefixes the name of the book from which it is taken, together with the date and author, if any. We are often thrown back into pre-Christian antiquity, as, for example, when the terrors of the infernal regions in which both the wicked and the angels dwell are related. The book, however, his own remarks by the word “actor.” The Speculum Naturae is so constructed that the various subjects are dealt with in a logical order, and, in each, within the same order. The book, however, his own marks, perhaps with a few things as were with God “in the beginning."

Book ii. treats of our own world, of light, colour, the four elements, and the various metals. In the treatment of the metals, the author borrows a great deal from the Speculum Historiale, and adopts for the most part an alphabetical arrangement.

The Speculum Historiale, in seventeen books and 2374 chapters, is a summary of all the scholastic knowledge of the age and does not appear to have been compiled with a definite purpose. It is mainly a practical manual for the student and the official alike; and, to fulfill this end, it treats of the mechanic arts of life as well as the subtilties of the scholar, the duties of the prince and the tactics of the general. The book begins with a survey of astronomy and the stars, and ends with the various arts and sciences, including medicine. The book deals with the psychology, physiology and anatomy of man, the five senses and their organs, sleep, dreams, ecstasy, memory, reason, &c.

The remaining four books seem more or less supplementary; the last (xiii.) is a summary of geography and history down to the year 1250, when the book seems to have been given to the world, perhaps along with the Speculum Historiale and possibly an earlier form of the Speculum Doctrinale.

The Speculum Doctrinale, in seventeen books and 2374 chapters, is a summary of all the scholastic knowledge of the age and does not appear to have been compiled with a definite purpose. It is mainly a practical manual for the student and the official alike; and, to fulfill this end, it treats of the mechanic arts of life as well as the subtilties of the scholar, the duties of the prince and the tactics of the general. The book begins with a survey of astronomy and the stars, and ends with the various arts and sciences, including medicine. The book deals with the psychology, physiology and anatomy of man, the five senses and their organs, sleep, dreams, ecstasy, memory, reason, &c.

The remaining four books seem more or less supplementary; the last (xiii.) is a summary of geography and history down to the year 1250, when the book seems to have been given to the world, perhaps along with the Speculum Historiale and possibly an earlier form of the Speculum Doctrinale.

The Speculum Majus, the great compendium of all the knowledge of the middle ages, as it left the pen of Vincent, seems to have consisted of three parts only, viz. the Speculum Naturale, Doctrinale, and Historiale. Such, at least, is Echard’s conclusion, derived from an examination of the earliest extant MSS. All the printed editions, however, consist of four parts, the additional one being entitled Speculum Aethereale. This has been clearly shown to be the production of a later hand, and is ascribed by Echard to the period between 1310 and 1325. In arrangement and style it is quite different from

---

1 He is sometimes styled Vincentius Burgundus; but, according to M. Dau, this appellation cannot be traced back further than the first half of the 13th century.

2 Apparently confirmed by the few enigmatical lines preserved by Echard from his epitaph—

"Pertult iste necem post annos mille ducentos, sanae vita sex habes, sex mihi retinetos."
VINCENT, G.—VINCENT DE PAUL, ST

The last book (xvii.), treats of theology or (as we shall now say) mythology, and is divided into four parts. The first chapter, dealing with the mysteries of God and the angels, and then passes on to the works of the six days and the creation of man. It includes dissertations on the various aspects of the creation and the history of the world, all of which is taken from the Hebrew scriptures.

As the fifteenth book of the Speculum Hierarchicale is a summary of the Speculum Naturale, so the Speculum Historiale may be regarded as the expansion of the last book of the same work. It consists of thirty-six chapters, and is divided into seven parts. The first chapter, dealing with the history of the Church, from its origins to the time of Constantine, is a brief survey of the early Church and its development. The book concludes with a summary of the life of St. Vincent de Paul, on which see below.

VINCENT, GEORGE (1776-1837), English landscape and marine painter, was born at Norwich in June 1776. He studied art under “Old” Crome, and at the age of fifteen began to contribute to the Norwich exhibition. From 1814 till 1823 he exhibited occasionally at the Royal Academy, and also in the Water-Cotour Exhibition and the British Institution. In 1819 he removed from Norwich to London, and he was a contributor to the Suffolk Street gallery from its foundation in 1824 till 1830. He was a great admirer of Crome; his landscapes, of which his works became slight and hastily executed. Finally he dropped out of sight, and he is believed to have died about 1831.

His most important work, a “View of Greenwich Hospital,” was shown in the International Exhibition of 1862. His “London from the Surrey Side of Waterloo Bridge” is also a fine work.

VINCENT, MARY ANN (1818-1887), American actress, was born in Portsmouth, England, on the 8th of September 1818, the daughter of an Irishman named Farlin. Left an orphan at an early age, she turned to the stage, making her first appearance in 1834 as Lucy in The Belle France, at Cowes, Isle of Wight. The next year she married J. R. Vincent (d. 1856), an actor with whom she toured England and Ireland for several years. In 1846 Mrs. J. R. Vincent went to America to join the stock company of the old National theatre in Boston. Here she became a great favourite. No actress in America, except Mrs Gilbert, has ever been such a “dear old lady” to so wide a circle of constant admirers. She died in Boston on the 4th of September 1857.

Her memory is honoured by the Vincent Memorial Hospital, founded in that city in 1859 by popular subscription, and formally opened on the 6th of April 1861, by Bishop Phillips Peckham, bishop of New York, and which was later known as the Vincent Hospital, and which was later known as the Vincent Hospital.

VINCENT DE PAUL ST (1576-1660), French divine, founder of the “Congregation of Priests of the Mission,” usually known as Lazarites (g.v.), was born on the 24th of April 1576 at Povy, near Dax, in Gascony, and was educated by the Franciscans at Dax and at Toulouse. He was ordained priest in 1600. Voyaging from Toulouse to Narbonne, he was taken by Barbary pirates, who took him to Tunis and sold him as a slave. He converted his third master, a renegade Italian, and escaped with him to Aigues-Mortes near Marseilles in June 1607. After short stays at Avignon and Rome, Vincent went to France, where he became a chaplain to Monsieur (afterwards Cardinal) de Bérulle, who was then founding the congregation of the French Oratory. At Bérulle’s instance he became curate of Clichy near Paris (1611); but this charge he soon exchanged for the post of tutor to the count of Joly in Folleville, in the diocese of Amiens, where his success in dealing with the spiritual needs of the peasantry led to the “missions” with which his name is associated. In 1617 he accepted the curacy of Châtillon-lès-Dombes (or sur-Chalonne) and here he received from the countess of Joly the patronage of which he was able to found his “confrérie de charité,” an association of women who ministered to the poor and the sick. In 1619 Louis XIII. made him royal almoner of the galleys. Among the works of benevolence with which his name is associated are the establishment of a hospital for galley slaves at Marseilles, the institution of two establishments for foundlings at Paris, and the organization of the “Filles de la Charité,” to supplement the work of the conférences, whose members were mainly married women with domestic duties. He died at Paris on the 27th of September 1660, and was buried in the church of St. Lazare. He was beatified by Benedict XIII. in 1720, and canonized by Clement XII. in 1737, his festival (duplex) being observed on the 10th of July. The Society of St Vincent de Paul was founded by Frederick Ozanam and others in 1833, in reply to a charge brought by some free-thinking contemporaries that the church no longer had the strength to inaugurate a practical enterprise. In a variety of ways it does a great deal of social service similar
to that of gilds of help. Its administration has always been in the hands of laymen, and it works through local "conferences" or branches, the general council having been suspended because it declined to accept a cardinal as its official head.

VINCENZO LEPEIS, ST. or VINCENZUS LERNENSIUS (d. c. A.D. 450), an ecclesiastical writer of the Western Church of whose personal history hardly anything is known, except that he was a native of Gaul, possibly brother of St Loup, bishop of Troyes, that he became a monk and priest at Lerinum, and that he died in or about 450. Lerinum (Lerins, off Cannes) had been made by Honoratus, afterwards bishop of Arles, the seat of a monastic community which produced a number of eminent churchmen, among them Hilary of Arles. The school did not produce an extensive literature, but it played an important part in resisting an exaggerated Augustinianism by reasserting the freedom of the will and the continued existence of the divine image in human nature after the fall. As regards Vincenzo he himself tells us that only after long and sad experience of worldly turmoil did he betake himself to the haven of a religious life. In 434, three years after the council of Ephesus, he wrote the Commonitorium adversus profanos omnium haeretorum nobiles, in which he ultimately aligns at Augustine's doctrine of grace and predestination. In it he distinguishes the "nobiles," which distinguish Catholic truth from heresy, and (cap. 2) lays down and applies the famous threefold test of orthodoxy—quod ubique, quod semper, quod ab omnibus credidit est. It is very striking that in his appeal to tradition Vincenzo assigns no part to the bishops as such—as apart from the council; he appeals to the ancient "teachers," not to any apostolic succession. His "semi-Pelagian" opposition to Augustine is dealt with by Prosper of Aquitania in his Pro Augustini doctrina responsiones ad capitula objectionum Vincentianarum. It explains why the Commonitorium has reached us only in a mutilated form.

The Commonitorium has been edited by Baluze (Paris, 1653, 1669 and 1684) and by Klipfel (Vienne, 1809). It also occurs in vol. i. of Migne's Patrol. Ser. Lat. (1846). A full summary is given in A. Harasch's History of Dogma, iii. 230 ff. See also F. H. Stanton, Place of Authority in Religion, pp. 167 ff.; A. Cooper-Marchin, The School of Lerins (Rochester, 1905).

VINCENT FERRER, ST (1355-1419), Spanish Dominican preacher, was born of respectable parentage at Valencia on the 23rd of January 1355. In February 1374 he took the Dominican habit, and after spending some years in teaching, and in completing his theological studies, he was licensed to preach. He graduated as doctor of theology at Lerida in 1374, and his sermons in the cathedral of Valencia from 1385 onwards soon became famous. Cardinal Peter de Luna took him with him to Paris in 1391; and on his own election to the pontificate as antipope Benedict XIII. made Ferrer his confessor and master of the sacred palace. Finding, however, the ecclesiastical atmosphere of Avignon an uncongenial one, he in 1397 resumed his work as a preacher, and Spain, France, Italy, Germany and Great Britain and Ireland were successively visited by him; and in every case numerous conversions were the result of his eloquence, which is described as having been singularly powerful and moving. In 1412 he was delegated by his native city to take part in the election of a successor to the vacant crown of Aragon; and in 1416 he received a special invitation to attend the council of Constance, where he supported the cause of Hus. He died at Vannes on the 5th of April 1419, and was canonized by Calixtus III. in 1455, his festival (duplex) being observed on the 5th of April.

See A Sorelli, Il trattato di S. Vincenzo Ferrer intorno al Grande Scisma d'Occidente (Bologna, 1906).

VINCI, LEONARDO (1660-1730), Italian musical composer, was born at Strorgoli in Calabria in 1660 and educated at Naples under Gaetano Greco in the Conservatorio dei Poveri di Gesù Cristo. He became known first by his comic operas in Neapolitan dialect in 1719; he also composed many serious operas. He was received into the Congregation of the Rosary at Formentillo in 1726 and died by poisoning in 1730, not 1732, as is generally stated. His comic operas, of which Le Zite in Galera (1722) is the best, are full of life and spirit; in his serious operas, of which Didone Abbandonata (Rome, 1728) and Aritaserse (Rome, 1730) are the most notable, have an incisive vigour and directness of dramatic expression deservedly praised by Burney. The well-known air "Vo solcando," from Aritaserse, is a good example of his style.

VINDELICIA, in ancient geography, a country bounded on the S. by Raetia, on the N. by the Danube and the Valum or Walense, on the W. by the Rhine, and on the E. by the territory of the Helvetii. It thus corresponded to the N.E. portion of Switzerland, the S.E. of Baden, and the S. of Württemberg and Bavaria. Together with the neighbouring tribes it was subjugated by Tiberius in 15 B.C., and towards the end of the 1st century A.D. was made part of Raetia (q.v.). Its chief town was Augusta Vindelicorum (Augsburg). Its inhabitants were probably of Celtic origin (cf. the recurrence of Vin- in other Celtic names—Vindobona, Vindonissa); some authorities, however, regard them as German. According to Dio Cassius (liv. 22) they were an agricultural people, and later writers (e.g. LIduferi, Origines, i. 4), describe the country as very fertile.

VINDHYA, a range of mountains in Central India. It forms a well-marked, though not quite continuous, chain across India, separating the Ganges basin from the Deccan. Starting on the west in Gujarat, the Vindhayas cross Malwa and the central portions of India, until their easternmost spurs abut on the valley of the Ganges at Rajmahal. They thus roughly form the northern side of the triangle, of which the other two sides are the Eastern and Western Ghats. They have an elevation of 1500 ft. and a breadth of 1000 ft. Geologically they give their name to the "Vindyan formation," one of the recognized rock systems of India. In legendary tradition they formed the demarcating line between the Madya-desha or middle land of the Sanskrit invaders and the non-Aryan Deccan, and they are still largely inhabited by aboriginal races such as the Bhils.

VINE. The grape-vine, botanically Vitis, is a genus of about thirty species, widespread in the north temperate zone, but richest in species in North America. The best known cultivated species is the old-world grape-vine, Vitis vinifera; a variety of this, silvestris, occurs wild in the Mediterranean region, spreading eastwards towards the Caucasus and northwards into southern Germany, and may be regarded as the parent of the cultivated vine. It is of interest to note that grape-stones have been found with mummies in Egyptian tombs of not later age than 3000 years. The seeds have the characteristics of those of V. vinifera, but show some very slight variations from the type of seed now prevalent. Among the Greeks in the time of Homer wine was in general use. The cultivation of the vine must also have been introduced into Italy at a very early period. In Virgil's time the varieties in cultivation seem to have been exceedingly numerous; and the varied methods of training and culture now in use in Italy are in many cases identical with those described by Columella and other Roman writers. Grape-stones have been found among the remains of Swiss and Italian lake dwellings of the Bronze period, and others in tufaceous volcanic deposits near Montpellier, not long before the historic era.

The old-world species is also extensively cultivated in California, but the grape industry in the old-world United States has been developed from native species, chiefly V. Labrusca and V. aestivalis and their hybrids with V. vinifera. Some of the American varieties have been introduced into France and other countries infested with Phylloxera, to serve as stocks on which to graft the better kinds of European vines, because their roots, though perhaps equally subject to the attacks of the insects, do not suffer so much injury from them as the European species.
The vine requires a high summer temperature and a prolonged period in which to ripen its fruit. Where these are forthcoming, it can be profitably cultivated, even though the winter temperature be very low. Tehrachines mentions that at Erivan in Russian Armenia the mean winter temperature is 7°-12° C. and the palleted vine 1 C., usually breaks its bud at a temperature of January is 4° C. and the minimum -25° C., and yet at both places the vine is grown with success. In the Alps it is profitably cultivated up to an altitude of 1870 ft., and in the north of Piedmont as high as 3180 ft. At the present time the limit of profitable cultivation in Europe passes from Brittany, lat. 47° 36', to beyond the Rhine by Liége and through Thuringia to Silesia in lat. 51° 55'. In former centuries vines were cultivated to the north of this region, as, for instance, in Holland, in Belgium largely, and in England, where they might have been grown. Indeed, experiments have been made in this direction near Cardiff in South Wales. The yield is satisfactory, and the wine made, the variety known as Gamay noir, is described as being like still champagne. In the middle ages, owing to various causes, the better wines of France and Germany could not be obtained in England except at prohibitive prices; but when this state of things ceased, and foreign wine could be imported, the English consumers would no longer tolerate the inferior productions of their own vineyards. It is also probable that the English mixed sugar or honey with the wine and thus supplied artificially the sweetness which the English sun denied. It is a curious fact that at the present day much or even most of the wine of finest quality is made at or near to the northern limits of possible cultivation with profit. This circumstance is probably explained by the greater care and attention bestowed both on the cultivation of the vine and on the manufacture of the wine in northern countries than in those where the climate is more propitiously. The relative inferiority of the wines made at the Cape of Good Hope and in Australia is partly due to variations of climate, the density of the population, the poor drainage of the land, the impeded air, and partly to the deficient skill of the manufacturers. That such inferiority may be expected to disappear is suggested by the success of vine-culture in Madeira and the Canary Islands.

The development of other species of Vitis, such as the curious succulent species of the Sudan and other parts of equatorial Africa, or the numerous kinds in India and Cochin China, is of course possible under suitable conditions; but it is obvious that an extremely long period must elapse before they can successfully compete with the product of many centuries. [See also generally the article Wine. For currants and raisins, both produced by varieties of the grape-vine, see the respective articles.]

Apart from their economic value, vines are often cultivated for purely ornamental purposes, owing to the elegance of their foliage, the rich coloration they assume, the shade they afford, and their hardiness.

Vines have woody climbing stems, with alternate, entire or palmately lobed leaves, provided at the base with small stipules. Opposite some of these leaves springs a tendril, by aid of which the plant is attached to some object. The tendril is either a simple tendril or a tendril consisting of several tendrillets, thus passing through the ordinary form of tendril and the inflorescence. The flowers are small, green and fragrant, and are arranged in dense clusters. Each has a small calyx in the form of a shallow rim, sometimes five-lobed or toothed; five petals, which cohere by their tips and form a cap or hood, which is pushed off when the stamens are ripe; and five free stamens, placed opposite the petals and springing from a central axis, one of which bears a two-celled anther. The anomalous position of the stamens in front of the petals is explained by the abortion or non-development of the inferior ovary, which is generally absent. Two ovules are seen on the hypogynous disk encircling the ovary. The ovary bears a sessile stigma and is more or less completely two-celled, with two erect ovaes in each cell. This ripens into the berry and seed. The cultivated vine has usually hermaphrodite flowers; but as it occurs in a wild state, or as an escape from cultivation, the flowers manifest a tendency towards unisexuality: that is, one plant bears flowers with stamens only, or only the rudiments of the pistil, while on another plant the flowers are bisexual. Exclusively female flowers without stamens do not appear to have been observed. Seedling plants from the cultivated vines often produce unisexual flowers, thus reverting to the feral type. Perhaps the explanation of the fact that some of the cultivated varieties are, as gardeners say, "bad setters,"—i.e. do not ripen their fruit owing to imperfect fertilization,—is to be sought in this natural tendency to dioecism.

The conformation of the vine stem has elicited a vast amount of explanatory comment. The most generally accepted explanation is the "symphal" one. According to this, the shoot of the vine is a "symphal," consisting of a number of "podia" placed one over the other in longitudinal series. Each podium consists of a portion of the stem bearing one or more leaves, each with an axillary bud or bud, and terminating in a tendril or an inflorescence. In V. Labrusca there is a tendril opposite each leaf, so that the podium bears only a single leaf. In other species there is a definite arrangement of the leaves, some with and others without tendrils opposite to them, the numerical order remaining constant or nearly so. These arrangements have doubtless some reference to climatic phenomena, continuity of growth being arrested by cold and promoted by warmth. In any case, it is obvious that these facts might be turned to practical ends in cultivation. A vine, for instance, that produces bunches of grapes at each joint is preferable to one in which there are several barren joints, as a larger quantity can be grown within a smaller area. The practice of pruning or "stopping" is consciously or unconsciously, regulated by the mode of growth.

The tendril or inflorescence, according to the views above explained, though in reality terminal, is bent to one side; hence it appears to be lateral and opposite to the leaf. While the tendril is thus diverted from its original direct course, the axillary bud of the leaf opposite the tendril begins a new podium, by lengthening into a shoot which assumes the direction the tendril had prior to its occurrence. This new podium, now in a direct line with its predecessor, produces leaves and ends in its turn in a tendril or inflorescence. A third podium succeeds the second, and so on. Other authorities explain the formation of the tendril and its anomalous position opposite to a leaf by supposing that the end of the stem bilatece during growth, one division forming the shoot, the other the tendril or inflorescence. It is not possible within the limits of our command to specify the facts and arguments by which these theories are respectively supported. Practically the tendrils assist the plant in its native state to scramble over rocks or trees. As in the case of similar formations generally, they are endowed with a sensitiveness to touch which enables them to grasp and coil themselves round any suitable object which comes in their way, and thus to support the plant. The seeds or grape-stones are somewhat club-shaped, with a narrow neck-like portion beneath, which expands into a rounded and thickened portion above. On the inner or central side of the seed is a ridge bounded on either side by a shallow groove. This ridge indicates the point of union of the "rape" or seed-stalk with the seed; it serves to distinguish the varieties of V. vinifera from those of other species. In endeavouring to trace the inflorescence and affinities of the vine, the characters afforded by the seed are specially valuable, because they have not been obliquely interfered with by human agency. Characters derived from the size, colour or flavour of the berry are of less value for
VINE

VINE

historical or genealogical purposes than those which are the outcome of purely natural conditions.

The vine is hardy in Britain so far as regards its vegetation, but not in respect of its fruits. In very good standing, for all practical purposes the vine must be regarded as a tender fruit. Planted against a wall or a building having a south aspect, or trained over a sunny roof, such sorts as the Black Cluster, Black Prince, and Black Spider, may ripen in the warmest English summers as so to be very pleasant eating; but in cold summers the fruit is not capable in the raw state, and can only be converted into wine or vinegar. For outdoor culture in this country, the spur system is generally preferred.

When the plant is grown under glass, the vine border should occupy the interior of the house and also extend outwards in the frequent framing; by installing 8 ft. or 6 ft. plants, the previous portions become well filled with roots, which may readily be done by packing up a turf wall at the extremity of the portion to be newly made; an exterior width of 15 ft. will be sufficient. If close together the best results are obtained. Also to prevent from entering by building a wall at the extreme edge of the border. Inside borders require frequent and thorough waterings. In well-drained localities the border may be partially below the ground level, but in damp situations it should be made on the surface; in either case the firm solid bottom should slope outwards towards an efficient drain. A good bottom may be formed by a solid down and 3 in. of gravel to which is to be added at least a foot thick of coarse, hard, rubbly material, a layer of rough turf, grass side downwards, being spread over it to prevent the compost from working down. The soil itself, which should be 2 or 3 ft. deep, should consist of five parts of well-rotted manure, one part old lime or broken bricks, including a little wood ashes or burnt earth (ballast), one part broken charcoal, and about one part of half-inch bones, the whole being thoroughly mixed, and the parts mixed together. It is well to break the garden with a spade or fork to remove the top soil, in which no roots are to be found, every two or three years, and to replace it with a mixture of good loam, rotten manure, and half-inch bones; and this should be done at least once

A mulch of half-decayed stable litter is useful to prevent loss of moisture in summer.

Young vines raised from eyes, i.e. buds having about 1 in. wood above and 1 in. below, are generally preferred for planting. The eyes being selected from well-ripened shoots of the previous year are planted about the end of January, singly, in small pots of light loam and fine soil, to a depth of about 1 in. The place to be planted should be in a propagating bed, having an average humidity of 75%, which should be increased to 85% when they have produced several leaves, the atmosphere being kept at about the same temperature or higher by sun heat during the day, and at about 75% at night. As soon as roots are freely formed the plants must be shifted into 6-inch pots, and later on into 12-inch ones. The shoots are trained up near the glass, and, with plenty of heat (top and bottom) and of water, will grow and multiply very rapidly. A careful selection of the best shoots at the base should be allowed to grow on. The best time for planting in spring, when the young shoots have just started. The vines should be planted inside the house, from 1 to 2 ft. from the wall, and from 6 ft. to 8 ft. apart, the roots being placed an inch deeper in the soil than before, carefully disentangled and spread outwards from the stem, and covered carefully and firmly with friable loam, without manure. When the shoots are fairly developed, the two strongest are to be selected and trained in. In forcing is commenced, the vineyard is shut up for two or three weeks without fire heat, the mean temperature ranging about 50°. Fire heat must be at first applied very gently, and may range about 55°F at night, and from 65°F to 70°F by day, but a few degrees more may be given them as the buds break and the new shoots appear. They are in flower, and onwards during the swelling of the bunches, 85°F may be taken as a maximum, running up to 90°F with sun heat and the temperature may be lowered somewhat when the fruit is ripe. The temperature must, however, be regulated according to the safety. Motors giving a higher temperature at the time their bunches show than Hamburghs. As much ventilation as the state of the weather will permit should be given. A moist growing atmosphere is necessary both for the swelling fruit and for the health of the foliage. A due and careful control of moisture may be kept up by the use of evaporating troughs and by syringing the walks and pathways two or three times a day, but the leaves should not be syringed. When the vines are in flower, and onwards during the swelling of the bunches, the lower leaves should be kept dry, but the acidity must not be excessive, lest the red spider and other pests should attack the leaves. In the course of syringing (insidious and frosty), the leaves should be syringed with the bunches, or if syringing is not possible the vines should be syringed with a mixture of water and extremely weak solution of potash or lime sulphate. Outside borders require watering in very dry summer weather only.

There are three principal systems of pruning vines, termed the long-rod, the short-rod and the spur systems, and good crops have been obtained by each of them. It is admitted that larger bunches are generally obtained by the long-rod than by the spur system. The principal of this mode of pruning is to train in at considerable length, according to their strength, shoots of the last year's growth for producing shoots to bear fruit in the present; these rods are afterwards cut away and replaced by young shoots trained up during the preceding summer, and these are in their turn cut out in the following autumn after bearing, and replaced by shoots of that summer's growth. By the short-rod system, short instead of long rods are retained; they are dealt with in a similar manner. The spur system has, however, become the most general. In this case the vines are usually planted so that one can be trained up under each rafter, or up the middle of the sash, the latter method being preferable if there is plenty of room for the foliage to expand; the lateral shoots, which will push out after the topping, must be again toped above their first or second joints. If the bunches are too numerous they must be thinned before the flowers expand, and the berries also must be properly thinned out and regulated as soon as they are well set, care being then taken to avoid overcrowding, that the bunches be not made too thin and lose.

The cultivation of vines in pots is very commonly practised with good results, and pot-vines are very useful for the earliest crops during the preceding summer, and these are in their turn cut out in the following season, but to be successful in this, the young rod produced must be thoroughly matured after it has reached its limit of growth. The periodical thorough cleansing of the vine stems and every part of the houses is of the utmost importance. The number of varieties of grapes possessing some merit is considerable, but a very few of them will be found sufficient to supply all the wants of the cultivator. For general purposes nothing approaches the Black Hamburgh (including Frankenthal) in merit.

Fungoid Diseases.—The most destructive form of fungoid disease

1. Vine leaf attacked by mildew, Uncinula necator (Erysiphe Tuckeri), which forms white, powdery spots on the upper face, reduced.

2. Grapes similarly attacked.

3. Portion of the mycelium of the fungus bearing spores (conidia).

4. Peritheciun or "fruit" of the fungus with its curled appendages, X100.

5. Ascus from perithecium containing six spores, X300.

which attacks the vine is caused by a mildew, Uncinula necator (Erysiphe Tuckeri) (fig. 2). The disease was first noticed in England in
VINE

1848; in 1848 it appeared at Versailles; by 1851 it had spread through all the wine-producing countries of Europe, being specially virulent in the lands bordering on the Mediterranean; and in the following year it made its appearance in Madeira. Like the Phylloxera (p. 471), the mildew was probably introduced from America. The disease is characterized by the appearance of a mycelium forming white or greyish-white patches on the young leaves; this spreads quickly and attacks the older leaves and shoots, and finally reaches the grapes. At first these are marked only by small brown spots; but the spots spread and fuse together, the skin of the grape is destroyed, and the flesh decays, the seed only remaining apparently untouched. The disease spreads by the mycelium growing on the epidermis of the plant. The hyphae composing the mycelium are provided with haustoria which project into the cells of the affected part (fig. 3). Some of these haustoria, the hyphae which project past the leaf bear spores (condia), which are constricted off one at a time, and by their means the fungus is distributed (fig. 2, 3). The perithecia are only produced exceptionally in Europe, but this stage of the life-history is common in the United States and causes a widespread spread of disease among the American vines. The mildew is in its turn attacked by a fungus of the same tribe, Cercospora Cesatii, which lives parasitically within the hyphae of its host, and at times even succeeds in destroying it. The mycelium has proved most efficacious, both in a remedy and a preventative of this disease, by scattering flowers of sulphur over the vines, before the morning dew has evaporated. Another method is the one part of lime with three parts of sulphur, and to sprinkle the mixture over the affected plants.

Another fungus which attacks vines, especially those of America, is Plasmopara viticola, which has also been introduced from America to Europe. The mycelium spreads through the green parts of the plant, attacking the leaves, twigs and unripe grapes. On the upper side of the leaf, where it is first visible, it forms pale green irregular spots, which become darker in colour. On the underside of the leaf and at these patches are white and are composed of the spore-bearing hyphae. The leaf ultimately becomes dried up and brittle. The grapes which are attacked cease to grow, turn brown or white, and ultimately dry up and fall off. This disease has been artificially treated with a spray of copper sulphate and lime, or sulphate of iron; solutions of these salts prevent the conidia from germinating.

Anthracnose is the name usually given to a disease, formerly known as "charbon," "pech," or "brenner." This disease is caused by the parasitism of Sphaeceloma ampelipulium, one of the Pyrenomycetes fungi (fig. 4). The fungus assails all the green parts of the vine, and injures the leaves and young shoots as much as it does the grape itself. The first sign of its presence is the appearance of a minute spot, which is greyish in the centre, with a brown border. This spot increases in size; in the stalks it assumes an oval shape, with a long axis parallel to the stalk, whilst in the leaves and grapes it is more or less circular in outline. The centre of the spots on the grapes becomes darker as the disease advances, and a red line appears dividing the dark brown border into an outer and an inner rim and giving a very characteristic appearance to the diseased plant. The surrounding tissue enlarges, so that the spots appear as if sunk in depressions, and bear a considerable resemblance to hollow wounds. Later the spots on the leaves often drop out. The berries do not shrivel up as those do that are affected by the black rot. The mycelium of Sphaeceloma grows just beneath the cuticle of the vine through which it enters, and has been observed to grow at a number of minute hyphae, which bear conidia. These are minute, oval, colourless spores, which serve to spread the disease over the vineyard and from place to place. The complete life-history of this form is as yet unknown; and what we know is that solution as to where the fungus passes the winter, and in what form, would probably afford some useful indications as to the method that should be adopted to combat the disease. Anthracnose has been known in Europe for many years, but has only been found in America since 1884, whether it was probably imported from the old world. As a preventive to its attacks the copper sulphate sprays and a solution (50%) of iron sulphate have been found very useful, as well as care in planting on well-drained soil that does not lie too low, the disease seldom appearing in dry, well-exposed vineyards. A great deal of confusion still exists with regard to this disease. A similar disease which of late has been frequently found in England, and which is ascribed to the fungus Glosostictis ampelophagum, is very similar to it. In their mode of attack, in the symptoms they produce, and in the result upon the grapes and the vine the two fungi are so much alike that for practical purposes they may be regarded as identical. Massee recommends that the shoots should be drenched with flowers of sulphur at intervals of ten days, while the disease continues to spread, a small quantity of quicklime in a finely powdered con-
whole grape. The latter for a time retains its plumpness, but on the appearance of little black pastules, which first occur on the part primarily affected, the grape begins to shrivel. This continues until the grape is reduced to a black hard mass, with the folds of skin pressed closely against the seeds, which disinte grades from grape to grape, so that as a rule many of the grapes in a bunch are destroyed. The hyphae of the mycelium of this fungus are septate, with numerous short branches. The pastules on the surface of the plant become black and are effused by the liquid. When this fungus passes the winter in the withered grapes which fall to the ground, and on these the mature form of the fungus (fig. 5, 2 and 3) is produced, hence every care should be taken to collect these and burn them. The use of the copper solutions mentioned above may also be recommended as a preventative.

Among the other fungi which infest the vine may be mentioned *Phytophthora cactorum* and *Ph. Laricis*, which, when the vine is young, cause the destruction of the leaves, the only part they assault. These, like the foregoing, are members of the Pyrenomycetes, while many other allied fungi have been described as causing spots on the leaves. *Cercospora Vitis* (Cladosporium viticulum), which has club-shaped, spores of a green-brown colour, also attacks the leaves; but, unless the season is extremely unfavourable, it does little harm.

A very disadvantageous disease of the vine is due to the ravages of another pyrenomycotic fungus, *Rosellinia (Dematophora) necatrix* (fig. 6), which forms subterranean strings of mycelium—so-called rhizomorphs. The diseased roots have been confounded with those belonging to *Phytophthora* and *Pythium*. The only mode of combating the malady seems to be to uproot the plants and burn them. Isolation of the diseased areas by means of trenches has also been practiced.

**VINEGAR**, a dilute solution of impure acetic acid, prepared by the acetous fermentation of alcohol or of substances which yield acetous acid. Acetous acid, which is employed in the preparation of vinegar, is obtained from the products resulting on the dry distillation of wood (vinegar). Ordinary or table vinegars, which contain, in addition to acetic acid, small quantities of alcohol, higher acids such as tartaric and succinic, various esters, aluminous substances, &c., are produced solely by acetous fermentation, wood vinegar being only employed in certain arts. Ordinary vinegar has been known from the earliest times, and its power of combining with or dissolving mineral substances caused the alchemists to investigate its preparation and properties. They failed, however, to obtain pure acetic acid, although by distillation they prepared more concentrated solutions (spiritus Veneris). In 1607 Stahl showed that vinegar could be concentrated by freezing out part of the water, and, better, in 1702, by neutralizing the acid with an alkali and distilling the salt with oil of vitriol. A notable improvement was made in 1789 by Löwit, who showed that the dilute acid could be concentrated by repeatedly passing it over charcoal powder, and by cooling he obtained a crystalline substance named in 1777 by Durande, "glacial acetic acid." The presence of an acid substance in the products of the dry distillation of wood was noted by Schultze in 1791. The first genuine vinegar was received in 1800 by the fermentation of pyroxyline acid. Its identity with acetic acid was demonstrated by Vauquelin in 1809.

The mechanism of acetous fermentation is described under Fermentation; here we only treat of the actual processes. There are two methods in use: the "quick" process, proposed in 1720 by Boerhaave and introduced by Schützenbach in 1823 (analogous processes were proposed at about the same time by Wagman in Germany and by Ham in England), and the older or "slow" process.

In the "quick" process advantage is taken of the fact that the fermentation proceeds more quickly when a large surface of the liquid is exposed to air. Any alcoholic liquid can be treated. The apparatus consists essentially of a vat divided into three portions: the lowest, which is separated from the one above by a grid or false bottom, serves for the collection of the vinegar; the central portion, which is by far the largest, is the chamber wherein the fermentation is carried on; and it is separated from the topmost section by a false bottom perforated with holes about two inches through which thin strings lead up into the upper part of the central section. The purpose of this disk is to divide the liquid placed upon it into drops so as to increase the surface of the liquid. The sides of the vat are enclosed by the lowest portion are provided with a ring of holes to admit air to the tub; and the vat is enclosed in a tightly fitting lid perforated by a hole through which the liquor to be fermented is admitted and the air escapes from the sides. The central chamber is filled with some material of large surface. The commonest are beech-wood shavings, which, before use, must be carefully freed from all extracts by washing and steaming, then dried, and finally soaked by immersion in hot vinegar for twenty-four hours. The fermented wort, prepared in various ways and of varying composition, or wine, is warmed to about 38° C. and then fed into the vat. It is agitated with the aid of a long cylinder and a slowly revolving paddle, and at the same time the air is increased, and the fermentation which ensues maintains the temperature at about 37°, and draws a current of air upwards through the shavings, which after a time become covered with the so-called "process" air. If the air is insufficient for the fermentation it is completely converted into acetic acid, but stronger liquors require to be passed through the vat three or four times. Some of the alcohol (and consequently some acetic acid) is carried away by the air in the process, and also by the escaping carbonic acid gas. The factories are led by baking the air or into water, whereby the alcohol and aldehyde are recovered. The same is effected in Singer's "fermentation under pressure.

For making wine-vinegar by the slow process, full-bodied wines about one year old and containing 10% of alcohol (this amount being obtained, when necessary, by blending) are preferred; and they are clarified by treatment with a small quantity of sulphurous acid deposit. The fermentation is carried out in casks holding from 50 to 100 gallons; these casks are repeatedly extracted with water in order to prevent any impurity finding its way into the vinegar; also it is found that the casks foul after about six years' use, when it is necessary to remove the deposits of argol, yeast sediments, &c., and re-extract with water, after which they are again fit for use. In all cases the wine should be boiled before distillation; the boiling strong vinegar and allowed to stand for eight days. Nine pints of the wine are now added every day until the cask is two-thirds full, and the mixture is allowed to stand for fourteen days. After this interval from the new cask, three to four heads are drawn off, and more wine added. The working temperature is about 25°. The progress of the operation is shown by the white (from the heads of the cask) which forms in the cask; if it be reddish, more wine must be added. In certain parts of France, Holland and of the Rhine district a different procedure is adopted. Two casks, fitted with false bottoms on which are placed nine cuttings, are taken; one cask is completely filled with wine, whilst the other is only half filled. The acetification proceeds more rapidly in the second cask, and after twenty-four hours hall the contents of the two casks are mixed together. When the process is complete the product is filtered through ripes in a paring tun. This is a cask fitted with a false bottom in which are placed spent tanner's wood, shavings, or, better, the pressed stalks and skins of grapes and raisins from wine manufacture. Household vinegar is made in upright casks; after the second-fourth heads, the vinegar is poured from one cask to another. Malt vinegar is sold in four strengths designated 18, 20, 22, 24, the last being "proof" vinegar, containing 6% of acetic acid and having a specific gravity of 1.060. It is made by heating vinegar to 60° C., converting yeasts to carbonic acid, which are neutralized by one fluid ounce of the vinegar.

Several other vinegars are made. Crystal vinegar is ordinary vinegar colorless by treatment with sinilic acid and also for use as an antiseptic and wood preservative. (See ACETIC ACID.)

**VINEELAND,** a borough of Cumberland county, New Jersey, U.S.A., in the southern part of the state, about 34 m. S. of Philadelphia and about 115 m. S.W. of New York. Pop. (1860) 3822; (1900) 4370, including 590 foreign-born; (1900 state census) 4593; (1910) 2859. Area, 1 sq. m. It is served by the Central of New Jersey and the West Jersey & Seashore railways, and by electric railway to Millville and Bridgeton. Vineeland is situated at an altitude of 90-118 ft. above the sea, on a
VINER—VINGT-ET-UN

97
generally level or slightly undulating plain, and has unusually broad, straight and well-shaded streets. The borough maintains a public library, a public park of 40 acres, artesian waterworks, a sewerage system and an electric lighting plant. It is the seat of the New Jersey Training School for Feeble-Minded Girls and Boys (1888), the State Home for the Care and Training of Feeble-Minded Women (1888), and the State Home for Disabled Soldiers, Sailors, Marines and their Wives. The Vineland Historical and Antiquarian Society (organized in 1864) has a library (8000 volumes in 1900) housed in the Society’s building, and it maintains a free lecture course. Saloons for the sale of intoxicating liquors have never been allowed in Vineland. The surrounding country is largely devoted to the growing of small fruits, grapes, peaches, pears and apples, and the raising of sweet potatoes; and within the borough are manufactured ungramed grape juice wines, boots and shoes, clothing, carpets, rugs, chenille curtains, pearl buttons, flint-glass tubes and bottles, and iron castings.

Vineland was founded in 1861 by Charles K. Landis (1835–1900), who conceived the idea of creating a settlement in the almost uninhabited “Pines” of Southern New Jersey; and after purchasing a large tract he laid out a village with small farms adjoining. The settlers, largely from New England and the Middle States, received the land at moderate prices on agreeing to make certain stipulated improvements. The township of Landis (pop. in 1910, 6435), named in honour of the founder of the settlement, was incorporated in 1864, having formerly been a part of Millville; from it Vineland was separated and was incorporated as a borough in 1880.

See The Founder’s Own Story of the Founding of Vineland (Vineland, 1903), a pamphlet published by the Vineland Historical and Antiquarian Society.

VINER, SIR ROBERT (1651–1688), lord mayor of London, was born in Warwick, but migrated in early life to London, where he was apprenticed to his uncle, Sir Thomas Viner (1598–1665), a goldsmith, who was lord mayor of London in 1653–54, and who was created a baronet in 1661. Soon Robert became a partner in his kinsman’s business, and in 1666 an alderman of the city of London; in 1665 he was made a knight, and in the following year a baronet. He was sheriff during the year of the great fire in London, and was chosen lord mayor in 1674. Combining like his uncle the business of a banker with that of a goldsmith, Viner was brought much into contact with Charles II. and with the court. The king attended his mayoral banquet, and the lord mayor erected an equestrian statue in his honour on a spot now covered by the Mansion House. It had been appointed the king’s goldsmith in 1661, Sir Robert was one of those who lent large sums of money for the expenses of the state and the extravagances of the court; over £40,000 was owing to him when the national exchequer suspended payment in 1672, and he was reduced to the necessity of compounding with his creditors. He obtained from the state an annuity of £3500. Viner died at Windsor on the 2nd of September 1688.

See Viner: a Family History, published anonymously (1885).

VINET, ALEXANDRE RODOLPHE (1797–1847), French critic and theologian, of Swiss birth, was born near Lausanne on the 17th of June 1797. He was educated for the Protestant ministry, being ordained in 1819, when already teacher of the French language and literature in the gymnasiu at Basel; and during the whole of his life he was as much a critic as a theologian. His literary criticism brought him into contact with Sainte-Beuve, for whom he procured an invitation to lecture at Lausanne, which led to his famous work on Port-Royal. Vinet’s Chrestomathie française (1830), his Études sur la littérature française au XIXe siècle (1849–51), and his Histoire de la littérature française au XVIIIe siècle, together with his Essais sur Pierre Corneille, Vieux et XVIIe siècles, Histoire de la prédication parmi les Réformés de France and other kindred works, gave evidence of a wide knowledge of literature, a sober and acute literary judgment and a distinguished faculty of appreciation. He adjusted his theories to the work under review, and condemned nothing so long as it was good work according to the writer’s own standard. His criticism had the singular advantage of being in some sort foreign, without the disadvantage which attaches in French eyes to all criticism of things French written in a foreign language. As theologian he gave a fresh impulse to Protestant theology, especially in French-speaking lands, but also in England and elsewhere. Lord Acton classed him with Rotte. He built all on conscience, as that wherein man stands in direct personal relation with God as moral sovereign, and the seat of a moral individuality which nothing can rightly infringe. Hence he advocated complete freedom of religious belief, and to this end the formal separation of church and state (Mémoire en faveur de la liberté des cultes (1826), Essai sur la conscience (1830), Essai sur la manifestation des convictions religieuses (1842). Accordingly, when in 1845 the civil power in the canton of Vaud interfered with the church’s autonomy, he led a secession which took the name of L’Eglise libre. But already from 1831, when he published his Discours sur quelques sujets religieux (Nouveaux discours, 1841), he had begun to exert a liberalizing and deepening influence on religious thought far beyond his own canton, by bringing traditional doctrine to the test of a living personal experience (see also Frommel, Gaston). In this he resembled F. W. Robertson, as also in the change which he introduced into pulpil style and in the permanence of his influence. Vinet died on the 4th of May 1847 at Claren’s (Vincennes, pop. 4435), a considerable part of his works was not printed till after his death.

His life was written in 1875 by Eugène Rambert, who re-edited the Chrestomathie in 1876. See also L. M. Lane, Life and Writings of A. Vinet (1890); L. Molines, Étude sur Alexandre Vinet (Paris, 1890); V. Rossel, Histoire de la littérate française hors de France (Lausanne, 1895); V. Rivet, Études sur les origines de la pensée religieuse de Vinet (Paris, 1896); A. Schumann, Alex. Vinet (1897). A uniform edition of his works was begun in 1906, see Revue de théologie et philosophie (Lausanne, 1908–14, 54 vols.).

VINGT-ET-UN (colloquially, "Van John"), a round game of cards, which is played by any number of persons who play, though five or six are enough. The right to deal has always been decided, the dealer gives one card face downwards to each person, including himself. The others thereupon look at their cards and declare their stakes—one, two, three or more counters or chips—according to the value of their cards. When all have staked, the dealer looks at his own card and can double all stakes if he chooses. The amount of the original stake should be set by each player opposite his card. Another card is then dealt, face downwards, all round; each player looking at his own. The object of the game is to make 21, by the pips or counters, on each card, the ace counting as 11, and the ten as 10. If the dealer’s card is 21, he receives double the stake, or doubled stake; if a player holds 21, he receives double likewise, but ties still pay the dealer. If a player receives two
similar cards he may put his stake on each and draw on them separately, receiving or paying according as he stands successfully or overdraws, but the trick and draw must be similar, i.e. he cannot draw both a knave and a queen at once. Most players, though their values are equal for the purpose of counting. A natural drawn in this way, however, only counts as 21, and does not turn out the dealer. Similarly a player may draw on three cards, or even four, should they be dealt him. A player who overdraws on one of such cards must declare and pay immediately, even though he stands on another. After a hand is played, the "pone" (Latin for "behind")—the player on the dealer's right—collects and shuffles the cards played, the dealer dealing from the remainder of the pack, till it is exhausted, when he takes the cards the pone holds, after the pone has cut them. It is a great advantage to deal, as the dealer receives from all who have already withdrawn, even if he overdraws himself.

French Vingt-et-un, or Vingt-et-un with variations, is played by any number of persons. The first deal is played as in the ordinary game. In the second ("Imaginary Tens") each player is supposed to hold a ten-card and receives one card from the dealer, face downwards; he is then considered to hold a ten-card plus the one dealt, and stands and draws, receives or pays, as in the ordinary game. If he receives an ace he holds a natural. In the third deal ("Blind Vingt-et-un") each player receives two cards and draws or stands without looking at either. The fourth deal is "Sympathy and Antipathy," each player staking, and declaring which of the two he will not: if the player is then dealt to him, if they are of the same colour, it is "sympathy"; if of different colours, "antipathy." At the fourth deal (Rouge-et-noir), each player, having received three cards, bets that the majority will be either black or red, as he chooses. In "Self and Company" every stake but the dealer, who then sets out two cards, face upwards, one for himself and one for the player. If the two cards are pairs, the dealer wins; if not, he deals one of the cards exposed is paired, paying or receiving according as that card belongs to himself or the "company." The seventh deal is "Pay the difference." Each player receives two cards, face upwards. The dealer pays or receives a stake for the difference in value, if the cards are pairs or last played and pay off the player. The ace counts as one. The eighth deal is "Clock." The stakes are pooled. The dealer deals the cards out, face upwards, calling "one" for the first, "two" for the second, and so on, the knave being 11, queen 12, and king 13. If any of the cards dealt correspond to the number called, the dealer takes the pool; if none correspond, he forfeits that amount. At the end of this (the eighth) deal, the next player deals.

VINITA, a city and the county-seat of Craig county, Oklahoma, U.S.A., in the N.E. part of the state, about 135 m. E.N.E. of Guthrie. Pop. (1900) 2399; (1907) 3157, including 624 Indians. Situated on the W. branch of the Grand River, in the centres of Missouri, Kansas & Texas and the St Louis & San Francisco railways. In the city are the Sacred Heart Institute (Roman Catholic), and a hospital for masons. Vinita is situated in an agricultural and stock-raising region, and lead, zinc, oil and natural gas are found in the vicinity; the city's water supply is obtained from artesian wells. Bricks are manufactured. The first settlement was made here in 1870 and Vinita was chartered as a city in 1885.

VINLAND (Old Norse, Vinland, i.e. Vineland or Wineland), so-called from the eastern coast of North America, visited and named by the Norsemen in the beginning of the 11th century. The word first appeared in print in Adam of Bremen's "Descriptio Insularum Aquilonis," an appendix to his Gesta Hammaburgensis Ecclesiae Pontificum, published by Lindenburg in 1595. In pursuit of historical study, Adam visited the Danish court during the reign of the well-informed monarch Svend Estridsson (1047-1076), and writes that the king "spoke of an island (or country) in that ocean discovered by many, which is called Vinland, because of the wild grapes [vitus] that grow there." The inscription of the story is abusive, but that grain unsown grows there abundantly [fruges ibi non seminatas abundare] is not a fabulous fancy, but is based on trustworthy accounts of the Danes." This passage offers important corroboration of the Icelandic accounts of the Vinland voyages, and is, furthermore, interesting "as the only undoubted reference to Vinland in a medieval book written beyond the limits of the Scandinavian world" (Fiske). Adam's information concerning Vinland did not, however, impress his medieval readers, as he placed the new land somewhere in the Arctic regions. "As, those regions which are beyond are filled with unapproachable ices and boundless glooms." These words show the futility of ascribing to Adam's account Columbus's knowledge of lands in the West, as many overzealous advocates of the Norse discoveries have done. The importance of the information, meagre as it is, lies in the fact that Adam received from the lips of kinsmen of the explorers (as the Danes in a sense were) certain characteristic facts (the finding of grapes and unsown grain) that support the general reliability of the Icelandic sagas which tell of the Vinland voyages (in which these same facts are prominent), but which were not put into writing by the Norsemen until later—just how much later it is not possible to determine. The fact that the Icelandic sagas concerning Vinland are not contemporaneous written records has caused them to be viewed by many with suspicion; hence such a significant allusion as that by Adam of Bremen is not to be overlooked. To the student of the Norse sources, Adam's reference is not so important, as the internal evidence of the sagas is such as to give easy credence to them as records of exploration in regions previously unknown to civilization. The contact with savages would alone prove that.

During the middle ages and the 12th and 13th centuries, the monks and the clergy were the first to revive geographical science and to practise pelagic navigation. For six centuries previous to about 800, European interest in practical geographical expansion was at a standstill. During the 6th and 7th centuries, Irish anchorites, in their "passion for solitude," found their way to the Hebrides, Orkneys, Shetlands, Faroes and Iceland, but they were not interested in colonization or geographical knowledge. The discovery of new lands in the West by the Norsemen came in the course of the great Scandinavian exodus of the 9th, 10th and 11th centuries—the Viking Age—when Norsemen, Swedes and Danes swarmed over the whole coast of Norway and Iceland. The main stream of Norsemen took a westerly course, striking Great Britain, Ireland and the Western Isles, and ultimately reached Iceland (in 874), Greenland (in 985) and Vinland (in 1000). This western migration was due mainly to political dissatisfaction in Norway, doubtless augmented by a restless spirit of adventure. The clergy and their followers that settled Iceland were "picked men," the flower of the land, and sought a new home from other motives than want or gain. They sought political freedom. In Iceland they lived active, not to say turbulent lives. A large part of their literature, and even their old sagas, have been given to us by the monks and the clergy. The Icelanders were the first to record on paper in their own tongue the sagas, the stories of the old Norse kings and the exploits of heroes. The sagas, in which ingenious, curious and often romantic stories of Iceland's early history came to be preserved, are the most valuable historical records of the country. They are important also as a record of the state of the human mind and the development of the human spirit in the Middle Ages. The sagas were written in the 12th and 13th centuries, and for some time were the only source of information on the history of the early Norsemen. They are of vital importance in the study of the medieval Norse and Icelandic languages. In the 13th century, a sagas, called the "Speculum regale" (The King's Mirror), and some papal letters, give interesting glimpses of the life of this colony. It was from the young Greenland colony that an attempt was made to establish a new outpost in Vinland, but plans for permanent settlement were given up on account of the hostility of the natives, with whom the settlers felt powerless to grapple. Gunpowder had not yet been invented.

Icelandic literature consists mainly of the so-called "sagas," or poetic narratives, and is rich in historical lore. In the course of the Middle Ages some other tales were among them the two independent narratives of the same events, which clash in the record of details. Modern investigators have been interested in establishing the superiority of one over the other of the two narratives. One of them is the "Saga of Eric the Red" as found in the collection known as Hauk's Book, so called because the manuscript was made by Hauk Erlendssson, an Iceland, who spent much of his life in Norway. It was copied, in part by Hauk himself, between
the years 1305 and 1334, the date of his death, and probably during the period 1310–20. It is No. 544 of the Arne-Magnusen collection in Copenhagen. Another manuscript that tells the same story, with only verbal variations, is found in No. 557 of the same collection. This manuscript was made later than Hauk's, probably in the early part of the 15th century, but it is not a copy of Hauk's. Both were made independently from earlier manuscripts. The story as found in these two manuscripts has been pronounced by competent critics, especially Professor Gustav Storm of the university of Christiania, as the best and the most trustworthy record.

The other saga, which by chance came to be looked upon as the chief repository of facts concerning the Vinland voyages, was found in a large Icelandic work known as the Flatey Book, as it was once owned by a man who lived on Flat Island (Flatey), on the north-western coast of Iceland. This collection of sagas, completed in about 1380, is "the most extensive and most perfect of Icelandic manuscripts," and was sent to Denmark in 1662 as a gift to the king. It was evidently the general excellence of this collection that gave the version of the Vinland story that it contained precedence, in the works of early investigators, over the Vinland story of Hauk's Book. (Reeves's Finding of Wineland contains fine photographs of all thevellum pages of the Flatey Book, illustrating Vinland voyages and the saga of Hauk.)

According to Flatey Book saga, Bjarni Heriulfson, on a voyage from Iceland to Greenland in the early days of the Greenland colony, was driven out of his course and sighted new lands to the south-west. He did not go ashore (which seems strange), but sailed northward to Greenland. Fifteen years later, according to this account, Leif Ericsson set out from Greenland in search of the lands that Bjarni had seen, found them and named them—Helluland (Flat-stone-land), Markland (Forestland) and Vinland. After his return to Greenland, several successive expeditions visited the new lands, none of which (strangely enough) experienced difficulty in finding Leif's hut in the distant Vinland.

According to the Vinland saga in Hauk's Book, Leif Ericsson, whose father, Eric the Red, had discovered and colonized Greenland, set out on a voyage, in 993, to visit Norway, the native land of his father. He visited the famous King Olaf Tryggvason, who reigned from 995 to 1000, and was bending his energies toward Christianizing Norway and Iceland. He immediately saw in Leif a likely aid in the conversion of the Greenlanders. Leif was converted and consented to come to Norway and thence to Greenland, and the next year (1000) started on his return voyage.

The saga says that he was "tossed about" on this long voyage, and came upon an unknown country, where he found "self-sown wheatfields, and vines," and also some trees called "mósur," of which he took specimens. Upon his arrival in Greenland, Leif presented the message of King Olaf, and seems to have attempted no further expeditions. But his visits to the new lands aroused much interest, and his brother Thorstein made an unsuccessful attempt to find them. Later, in 1003, an Icelander, Thorfinn Karlsefni, who was visiting the Greenland colony, and who had married Gudrid, the widow of Leif's brother Thorstein, set out with four vessels and 160 followers to found a colony in the new lands. Here they remained three years, during which time a son, Snorri, was born to Thorfinn and Gudrid. This expedition, too, found "grapes and self-sown wheat," though seemingly not in any great abundance. Concerning the southernmost region of Vinland, the saga says: "They found self-sown wheatfields in the lowlands, but vines everywhere on higher places. . . . There were great numbers of wild animals in the woods." Then the saga relates that, one morning a large number of men gave the various ships some nautically toward them and landed, staring curiously at them: "They were swarthy men and ill-looking, and the hair of their heads was ugly; they had large eyes and broad cheeks." Later the saga says: "No snow came there, and all of their live stock lived by grazing, and thrived." The natives appeared again the next spring, and a clash occurred. Fearing continued trouble with them, Karlsefni resolved to return to Greenland. This he did a year later, and spent the winter of 1006–7 there, whereas he settled in Iceland. From him and Gudrid a number of prominent ecclesiastics claimed descent, and also Hauk Eriksen. The Vinland story was doubtless a cherished family possession, and was put into writing, when writing sagas, instead of telling them, came into fashion. And here it is important to remember that before the age of writing in Iceland there was a saga-telling age, a most remarkable period of intellectual activity, by the aid of which the deeds and events of the seething life of the heroic age was carried over into the age of writing. "Among the medieval literatures of Europe, that of Iceland is unrivaled in the profusion of detail with which the facts of ordinary life are woven into the story, and the chronicles of the expeditions of numberless real persons stand out from the historic background." (Origines Islandicae). Icelandic literary history says that Ari the Learned (born in 1067) was "the first man in this land who wrote in the Norse tongue history relating to times ancient and modern." Among his works is the Book of Settlements, "a work of thorough and painstaking research unexcelled in medieval literature" (Fiske). His work The Book of Icelanders is unfortunately lost, but an abridgment of it, Libellus Islandorum, made by Ari himself, contains a significant reference to Vinland. It tells that the colonists in Greenland who had found "beaches suitable for settlement and stone implements, whereby it may be seen that the same kind of folk had been there as they which inhabited Vinland, and whom the men of Greenland (i.e. the explorers) called the "skarlings" (i.e. inferior people)." From this allusion one cannot but think that so keen and alert a writer as Ari had given some attention to Vinland in the lost work. But of this there is no other proof. We are left to affirm, on account of definite references in various sagas and annals to Leif Ericsson and the discovery of Vinland, that the saga as preserved in Hauk's Book (and also in No. 557 of the Flatey Book) was early put into writing by a competent hand. Dr Finnur Jonsson of Copenhagen says: "The classic form of the saga and its vivid and excellent tradition surely carry it back to about 1200." This conservative opinion does not preclude the possibility, or even probability, that written accounts of the Vinland voyages existed before this date. Vigfusson, in speaking of the sagas in general, says: "We believe that when once the first saga was written down, the others were in quick succession committed to parchment, some still keeping their form through a succession of other changes. Information written down quickly, in due time, was lost and forgotten for ever.

The fact that there are discrepancies between the two versions as they appear in the Hauk's Book and in the Flatey Book does not justify the overthrow of both as historical evidence. The general truth of the tradition is strengthened by the fact that it has come down from two independent sources. One of them must be the better, however, and this it is the province of competent scholars to determine. The best modern scholarship gives the precedence to the Hauk's Book narrative, as it harmonizes better with well-established facts of Scandinavian history, and is less a more plausible account. In accordance with this decision, Bjarni Heriulfson's adventure should be eliminated, the priority of discovery given to Leif Ericsson, and the honour of being the first European colonists on the American continent awarded to Thorfinn Karlsefni and his followers. This was evidently the only real attempt at colonization, despite the numerous contentions to the contrary. Under date of 1121 the Icelandic annals say: "Bishop Eric of Greenland went in search of Vinland." Nothing further is recorded. The fact that his successor as bishop was appointed in 1123 would seem to indicate that the Greenlanders had information that the colony had perished.

The only important phase of the Vinland voyages that has not been definitely settled is the identifications of the regions visited by Leif and Thorfinn. The Danish antiquarian Rafn, in his monumental Antiquitates Americanae, published in 1857, and much discussed in America at that time, held for Rhode Island as Leif's landfall and the locality of Thorfinn's colony. Professor E. N. Horsford, in a number of monographs (unfortunately
of no historical or scientific value), fixed upon the vicinity of Boston, where now stand a Leif Ericson statue and Horsford's Norumbega Tower as testimonials to the Norse explorers. But in 1887 Professor Storm announced his conviction that the lands visited by the Norsemen in the early part of the 11th century were Labrador, Newfoundland and Nova Scotia. And a careful reading of the Hauk's Book narrative seems to show that the numerous details of the saga fit Nova Scotia remarkably well, and much better than any other part of the continent. This view has in recent years been quite generally accepted by Anglorusovians who followed the 1910 Professor the Flatey Book saga, Maitland's a botanist of Harvard University, published a paper in Rhodora, vol. 12, No. 134, in which he contends that it is most probable that the "vinber" of the sagas were not "grapes," but "wine-

berries," also known as the mounat or rock cranberries. The "self-sown wheat " of the sagas he identifies as strand wheat, instead of Indian corn, or wild rice, and the mősor trees as the canoe birch. He thinks the natives were Eskimos, instead of American Indians, as stoutly maintained by John Fiske. Professor Fernald concludes his paper by saying that: "The mass of evidence which the writer has in hand and which will be ready for publication, makes it clear that, if we read the sagas in the light of what we know of the abundant occurrence north of the St Lawrence of the 'vinber' (Vaccinium Vitis-Idea or possibly Ribes triste, R. prostratum, or R. lacustre), 'hveiti' (Elymus arenarius), and 'mösur' (Batawa alba, i.e. B. popyfera of many botanists), the discrepancies in geography, ethnology and zoology, which have been so troublesome in the past, will disappear; other features, usually considered obscure, will become luminous; and the older and less distorted sagas, at least in their main incidents, will become vivid records of actual, geographic exploration."

It is possible that Professor Fernald may show conclusively that Leif's landfall was north of the St Lawrence. That the "vinber" were mountain cranberries would explain the fact, mentioned in the Flatey Book saga, that Leif filled his after-boat with "vinber" in the spring, which is possible with the cranberries, as they are most palatable after having lain under the snow for the winter. But Thorinn Karlsdæi found no abundance of "vinber," in fact one of his followers composed some verses to express his disappointment on this score. "Vines" were found only in the southernmost regions reported by Karlsdæi. It is to be noted that the word "vines" is more prominent in the Hauk's Book narrative than the word "vinber." At present it does not seem likely that Professor Fernald's argument will seriously affect Professor Storm's contention that Thorfin's colony was in Nova Scotia. At any rate, the incontrovertible facts of the Vinland voyages are that Leif and Thorfinn were historical characters, that they visited, in the early part of the 11th century, some part of the American continent south-west of Greenland, that they found natives whose hostility prevented the founding of a permanent settlement, and that the sagas telling of these things are, on the whole, trustworthy descriptions of actual experience.

BIBLIOGRAPHY.—The bibliography of this subject is large, but adequate documents, accounts and discussions may be found in the following modern works: Gustav Storm. Studies on the Vin-

VINogradoff, Paul (1854- ), Anglo-Russian jurist, was born at Kostroma in Russia. He became professor of history in the university of Moscow, but his zeal for the spread of education brought him into conflict with the authorities, and consequently he was obliged to leave Russia. Having settled in England, Vinogradoff brought a powerful and original mind to bear upon the social and economic conditions of early England, a subject which he had already begun to study in Moscow. His Villainage in England (1892) is perhaps the most important book written on the peasantry of the feudal age and the village community in England; it can only be compared for value with F. W. Maitland's Domestical Book and Beyond. In masterly fashion Vinogradoff here shows that the villain of Norman times was the direct descendant of the Anglo-Saxon freeman, and that the typical Anglo-Saxon settlement was a free community, not a manor, the position of the freeman having steadily deteriorated in the centuries following the Norman Conquest. The status of the villain and the conditions of the manors in the 12th and 13th centuries are set forth with a legal precision and a wealth of detail which shows its author, not only as a very capable historian, but also as a brilliant and learned jurist. Almost equally valuable was Vinogradoff's essay on "Folkland" in vol. viii. of the English Historical Review (1893), which proved for the first time the real nature of this kind of land. Vinogradoff followed up his Villainage in England with The Growth of the Manor (1905) and English Society in the 12th Century (1906), works on the lines of his earlier book. In 1905 he was appointed Corpus professor of jurisprudence in the university of Cambridge and in 1911 became a fellow of the British Academy. He received honorary degrees from the principal universities, was made a member of several foreign academies and was appointed honorary professor of history at Moscow.

VINOV, Joseph (1863-1886), French soldier, was originally intended for the Church, but, after some years at a seminary, he decided upon a military career, and entered the army in 1883. When he was a sergeant in the 14th line infantry, he took part in the Algerian expedition of 1850. He won his com-

mission at the capture of Algiers, and during the subsequent campaigns he rose by good service to the rank of colonel. He returned to France in 1850, and in the Crimean War served under Canrobert as general of brigade. For his brilliant conduct at the Malakoff he was promoted general of division, and he led a division of Niel's corps in the campaign of Solferino. Retired on account of age in 1865, he was recalled to active service on the outbreak of the war of 1870, and after the early reverses was put at the head of the XIII. army corps, which, fortunately for France, did not arrive at the front in time to join in the catastrophe of Sedan. By a skilful retreat he brought his corps intact to Paris on September 7th. Vinoy during the siege commanded the III. army operating on the south side of the capital and took part in all the actions in that quarter. On Trochut's resignation he was appointed to the supreme command, in which capacity he had to negotiate the surrender. During the conference he held important commands in the army of Versailles, and occupied the burning Tuileries and the Louvre on May 23rd. He was in the same year made grand chancellor of the Legion of Honour.

Vinoy wrote several memoirs on the war of 1870-71; Opérations de l'armée pendant le siège de Paris (1872), L'Armistice et la com-

mune (1872), L'Armée française (1873).

VINT, a Russian card-game. It is generally considered as the immediate ancestor of Bridge (q.v.). Vint means in Russian "screw" and is given to the game because the four players, each in turn, propose, bid and overbid each other until one, having bid higher than the others care to follow, makes the trump, his vî-sâ-vîs becoming his partner. It has many points of resemblance to Bridge. The cards have the same rank; the score of tricks is entered under the line, and points for slam, penalties and honours above the line; while the value of the different suits is the same as in Bridge: spades, clubs, diamonds, hearts and "no trumps." In a "no trump" declaration aces only count as honours; in a suit declaration both the aces and the five next highest cards. During the progress of the bidding and declaring, opportunity is taken by the players to indicate by their calls their strength in the various suits and the high cards they hold, so that, when the playing begins, the position of the best cards and the strength of the different hands can often be fairly accurately estimated.
The leads are subject to much the same rules as those in Bridge.

See The Laws and Principles of Vint, edited by Frank W. Hadden (The viol was)

VINTON, FREDERICK PORTER (1846- ), American portrait painter, was born at Bangor, Maine, on the 29th of January 1846. He was a pupil of Duveneck, of William M. Hunt in Boston, of Léon Bonnat and Jean Paul Laurens in Paris, and of the Royal Academy of Munich. In 1891 he was elected a full member of the National Academy of Design, New York.

VIOLA, a generic term for the bowed precursors of the violin (q.v.), but in England more specially applied to those immediate predecessors of the violin which are distinguished in Italy and Germany as the Gamba family. The chief characteristics of the viols were a flat back, sloping shoulders, "c"-shaped sound-holes, and a short finger-board with frets. All these features were changed or modified in the violin, the back becoming delicately arched, the shoulders reverting to the rounded outline of the guitar or troubadour fiddle, the shape of the sound-holes changing from "c" to "f," and the finger-board being carried considerably nearer the bridge. The viols, of which the origin may be traced to the 15th and 14th centuries, German Minnesinger fiddle, characterized also by sloping shoulders, can hardly be said to have evolved itself into the violin. The latter was derived from the guitar-fiddle through the Italian lyre or viol-lyra family, distinguished as da braccio and da gamba, and having early in the 17th century the outline and "f" sound-holes of the violin. The viol family consisted of treble, alto, tenor and bass instruments, being further differentiated as da braccio or da gamba according to the proportion in which they were held against the arm or between the knees. The favourite viol da gamba, or division viol, frequently had a man or a woman's head instead of the scroll finish to the pegbox. Thomas, the importance of the five or more sympathetic strings tuned an octave higher than the strings in the instrument, which he calls bass viol or geige da braccio.

Michael Praetorius mentions no less than five sizes of the viol da gamba, the largest corresponding to the double bass, and in a table he notes the various accuracies in use for each. He carefully distinguishes these instruments as violen and the viole da braccio (our violin family) as geigen. Of the latter he gives six sizes, the highest being the pochette with vaulted back, a rebeck in fact, and the lowest corresponding to the violoncello, which he calls bass viol or geige da braccio.

The viols were very popular in England in the 16th and 17th centuries, holding their own for a long time after the introduction of the louder-toned violin; they are fully described and figured in the musical works of the period, and more especially in Christopher Simpson's Vinton Viol (1614), Thomas Maw's Musical Monument (1676) and John Playford's Introduction to the Skill of Music (K.S.)

VIOLA [Fr. viole, Ger. Bratsche, Ital. viola, alto], the tenor member of the violin family. The construction of the viola is the same, but on a larger scale, as that of the violin (q.v.). The instrument is pitched a perfect fifth below the violin.

VIOLET. The violas comprise a large botanical genus (Viola) of which more than 200 species have been described—found principally in temperate or mountain regions of the northern hemisphere; they also occur in mountainous districts of South America and South and Tropical Africa, while a few are found in Australasia. The species are mostly low-growing herbs with alternate leaves provided with large leafy stipules (fig. 1). The flowers, which are solitary, or rarely in pairs, at the end of slender axillary flower-stalks, are very irregular in form, with five sepalas prolonged at the base, and five petals, the lowest one larger than the others and with a spur, in which collects the honey secreted by the spurs of the two adjoining stamens. The five anthers are remarkable for the complicated processes which extend beyond the anther cells and form a sort of cone around the style (fig. 2). The ovary is superior and one-celled, with three parietal placenta and numerous ovules; it bears a single style, which ends in a dilated or hood-like stigma (fig. 3). The fruit is a capsule bursting loculi, i.e. through the centre of each of the three valves. By the contraction of the valves the small smooth seeds, which form a row down the centre, are shot out to some little distance from the parent plant. The irregular construction of the flower is connected with fertilization by insect agency. To reach the honey in the spur of the flower, the insect must thrust its proboscis into the flower close under the globular head of the stigma. This lies in the anterior part of a groove fringed with hairs on the inferior petal. The anthers shed their pollen into this groove, either of themselves or when the pistil is shaken by the insertion of the bee's proboscis. The proboscis, passing down this groove to the spur, becomes dusted with pollen; as it is drawn back, it presses up the lip-like valve of the stigma so that no pollen can enter the stigmatic chamber; but as it enters the next flower it leaves some pollen on the upper surface of the valve, and thus cross-fertilization is effected. In the sweet violet, V. odorata and other species, inconspicuous permanently closed or "cleistogamic" flowers (fig. 4) occur of a greenish colour, so that they offer no attractions to insect visitors and their form is correspondingly regular. The anthers are so situated that the pollen on escaping comes into contact with the stigma; in such flowers self-fertilization is compulsory and very effectual, as seeds in profusion are produced.

Several species of Viola are native to Great Britain. Viola canina (fig. 5) is the dog violet, many forms or subspecies of which are recognized; V. odorata, sweet violet, is highly prized for its fragrance, and in cultivation numerous varieties have originated. The Neapolitan or Parma violet (var. pallida Planch.) is a form with very sweet-scented, double, pale lavender flowers; var. sulphurea has shining deep green leaves and lemon-yellow flowers, deeper yellow in the centre, and with a pale-violet spur. Sweet violets like a rich, fairly heavy soil, with a north or north-west aspect if possible;
VIOLIN

they are readily increased by dividing the crowns after flowering. Other species known in gardens are: V. alata, flowers yellow or red.

2. Fruit, split open.

violet with yellow eye; V. bifora, a pretty little species 3–4 in. high with small yellow flowers, the large petal being streaked with black; V. calcarata, flowers light blue or white, or yellow in var. flavus; V. cornuta, flowers pale blue—there are a few good varieties of this, including one with white flowers; V. cucullata, a free-flowering American species with violet-blue or purple flowers; V. sanguinea, a native of Algeria, with large violet or yellow flowers; V. pedata, the bird's-foot violet, with pedately divided leaves and usually bright blue flowers; V. rothomagensis, a native of western Europe, with flowers bright blue striped with black, and sometimes called the Rouen violet; and V. swarni, a native of Asia Minor, the Russian violet, with pale-blue sweet-scented flowers. The garden pansies or heartseases are derivatives from V. tricolor, a cornfield weed, or V. alata, a native of the Altai mountains. (See Pansy.)

BEDDING VIOLAS, which differ from pansies in some slight technical details, have been raised from V. cornuta and V. lutecia by crossing with the show pansies. The application of an infusion of violet leaves was at one time believed to have the power of reducing the size of cancerous growths, but its use is now discredited.

VIOLIN, a musical instrument consisting essentially of a resonant box of peculiar form, over which four strings of different thicknesses are stretched across a bridge standing on the box, in such a way that the tension of the strings can be adjusted by means of revolving pegs to which they are severally attached at one end. The strings are tuned, by means of the pegs, in fifths, from the second or A string, which is tuned to a fundamental note of about 445 vibrations per second at the modern normal pitch: thus giving

\[ \text{as the four open notes. To produce other notes of the scale the length of the strings is varied by stopping them with the fingers on a finger-board, attached to a "neck" at the end of which is the "head" in which the pegs are inserted. The strings are set in vibration by drawing across them a bow of horse-hair, which is rosin to increase adhesion. The characteristic features which, in combination, distinguish the violin (including in that family its larger brethren the viola and the violoncello) from other stringed instruments are: the restriction of the strings to four, and their tuning in fifths; the peculiar form of the body, or resonating chamber, especially the fully moulded back as well as front, or belly; the shallow sides or "ribs" bent into characteristic curves; the acute angles of the corners where the curves of the ends and middle "bouts" or waist ribs meet, and the position and shape of the sound-holes, cut in the belly. By a gradual process of development in all these particulars the modern violin was evolved from earlier bowed instruments, and it attained its highest perfection at the hands of the great Italian makers in the 16th, 17th and early 18th centuries, since which time, although many experiments have been made, no material improvement has been effected upon the form and mode of construction then adopted.

The body, or sounding-box, of the violin is built up of two arched plates of thin wood, the belly and the back, united by side pieces or ribs to form a shallow box. The belly is cut from soft elastic woods, generally lignum vitae, which is used universally for this purpose, though it is now made of a close-grained wood, generally sycamore or maple. Both back and belly are carved to their model from the solid, but for utilitarian reasons are generally luted or glued to longitudinal sections; while the sides or ribs, of very thin sycamore or maple, usually in six sections, are bent on a mould, by the aid of heat, to the required form. Into the corners are glued corner-blocks of soft wood, which help to retain the ribs in their sharply mortised form, and materially strengthen the whole structure. Into the joints of the sides and the back and belly are glued thin lining strips, bent to the mould, giving a bearing surface for the transverse line dividing the surface into two approximately equal areas, that is, about 3 in. below the middle, the lower end of the body being wider than the upper part or shoulders; whereby a greater length is rendered available for the vibrating portion of the strings.

A short distance behind the right foot of the bridge, the sounding-post, a rod of soft pine about \( \frac{3}{4} \) in. thick, is fixed inside the body in contact with the belly, and serves directly to support the bridge against the pressure of the bridge under the tension of the strings, but to convey vibrations to the back. It also exercises a very important influence on the nodal arrangement of these vibrating plates. The pressure of the other foot of the bridge, where the tension of the fourth string is far less than that of the first string, is partly sustained by the bass-bar—a strip of wood tapering from the middle to both ends, which is glued underneath the belly and extends to within rather less than 2 in. of the ends of the instrument. This fitting not only serves to strengthen the belly mechanically, but exerts a profound effect upon the vibrations of that plate.

The fixed structure is completed by the head, which surmounts the neck and consists primarily of a narrow box into the sides of which are inserted the pegs round which the free ends of the strings are wound. The head is usually provided by an ornamentation which in the hands of the Italian makers followed the traditional pattern of a scroll, or volute, offering the skilled craftsmen infinite scope for boldness and freedom in its execution; but sometimes, especially in the English instruments, it was carved in the form of an animal's head, usually a lion's.

The strings, fastened at one end to an ebony tail-piece or tongue, which is fitted to the back of the instrument, pass over the bridge, along the finger board and over the nut (a dwarf bridge forming the termination of the finger-board) to the pegs. The effective vibrating portion of the strings is accordingly the bow between the nut and the first joint of the bridge.

1. Up to about the year 1800 the old Italian makers, including Stradivari (in his earlier instruments), usually strengthened the neck of the violin by driving nails, frequently three and sometimes four, through the top block into the base of the neck, which was not mortised into the block.
in an ordinary full-sized violin about 1 3 in. The portion of the strings to which the bow is applied lies over the space measuring about 23 in., between the bridge and the free end of the fingerboard. The strings are manufactured from so-called catgut, made from the masticated intestines of the thinnest, third or D string from .026 to .046 in. more or less. The necessary weight is given to the string of lowest pitch, G, without unduly sacrificing its elasticity, by winding a thin gut string with fine copper wire. The result is a string that not only constitutes a quick damping, but also softening the ultimate quality of the note.

An ornamental feature characteristic of nearly all violins is the purfling, a very thin slip of wood with margins of ebony or (rarely) whalebone, inlaid in thin strips close to the edge of both plates, and following the entire outline of the instrument. In some instruments, especially of the Brescian school, a double line of purfling was inserted.

The number of pieces of wood of which the violin is composed amounts to about 70, varying, as the plates are made in one piece or built together, and with the number of sections in which the ribs are put together. Of this number 57 pieces are built into the permanent structure, while 13 may be described as fittings.

The whole of the permanent structure is cemented together with glue alone, and it is a striking testimony to the mechanical conditions satisfied by the design, that the instrument built of such slender material with its weight of over 4 lb., withstood the considerable stresses applied to it. It is worthy of remark that after the lapse of so many years, since it attained perfect musical efficiency, no essential adjustment of any part of the bow, or of the instrument itself, has been necessary.

No play of fancy has drafting anything beyond quite minor ornamentation on a work of art distinguished by its simplicity of pure outline and proportion. The following are the principal dimensions of a very fine specimen of Stradivari's work, which has been preserved in perfect condition since the latter end of the 17th century:

- **Length of body:** 14 in. full.
- **Width at the center (top):** .61 in. 4/8 in. ordinary.
- **Width across bottom:** .83 in.
- **Height of sides (top):** .13 in.
- **Height of sides (bottom):** .129 in.

The back is in one piece, supplemented a little in width at the lower part, allowing for the existence of the great makers, and is cut from very handsome wood; the ribs are of the same wood, while the belly is formed of two pieces of soft pine of rather fine and beautifully even grain. The ribs, cut with perfect precision, exhibit much grace and freedom of design. The scroll, which is very characteristic of the maker's style and beautifully moulded, harmonizes admirably with the general modelling of the instrument. The model is flatter than in violins of the earlier period, and the design bold, while displaying all Stradivari's microscopic perfection of workmanship. The whole is coated with a very fine orange-red varnish, which, though touched since it left the maker's hands, and the only respects in which the instrument has been altered since that date are in the fitting of the longer neck and stronger bass-bar necessitated by the increased compass and raised pitch of modern violin making.

The measurements given above are the same as those of a well-known Stradivari of later date (1714).

The acoustics of the violin are extremely complex, and notwithstanding many investigations by men of science, and the enunciation of some plausible hypotheses with regard to details of its operation as a musical instrument, remain as a whole obscure. So far as the elementary principles which govern its action are concerned, the violin follows familiar laws (see Sound). The different notes of the scale are produced by vibrating strings differing in weight and tension, and varying in length under the hand of the player. The vibrations of the strings are conveyed through the bridge to the body of the instrument, which fulfils the common function of a resonator in reinforcing the notes initiated by the strings. So far first principles carry us at once. But when we endeavour to detail in detail the causes of the peculiar characteristics of tone of the violin family, the great range and variety in that character obtained in different instruments, the extent to which those qualities can be controlled by the bow of the player, and the mode in which they are influenced by minute variations in almost every component part of the instrument, we find ourselves faced by a series of problems which have so far defied any but very partial solution.

The distinctive quality of the musical tones of the violin is produced by what is known as partials or overtones, or in the upper harmonic or partial tones superimposed on the fundamental notes produced by the simple vibrations of the strings.

The characteristic tone and its control by the player are undoubtedly conditioned in the first place by the peculiar path of the vibrating string under the action of the rosin bow. This takes the form not of a symmetrical oscillation, but of a succession of alternating bound and free movements, as the string adheres to the bow according to the pressure applied and, releasing itself by its own vibrations.

The lightness of the material of which the strings are made conduces to the production of very high partial tones which give brilliance of sound, while the low elasticity of the gut causes those partial tones which constitute the sound to be quickly damped, thus softening the ultimate quality of the note.

In order that the resonating body of the instrument may fulfill its highest purpose in reinforcing the complex vibrations set up by the bow, it is necessary to determine the number of partials of which the whole, but in the number of related partials whose oscillations determine the upper partial tones, it is essential that the plates, ribs, and other parts maintain the notes so as to respond sensitively to the selective impulses communicated to them. It is the attainment of this perfect selective responsiveness which marks the construction of the best instruments. Many factors contribute to this result. The thickness of the plates in different parts of their areas, the size and form of the interior of the body, the size and shape of the sound-holes through which the vibrations of the contained air are communicated to the external air, and which also influence the nodal points in the belly, according to the number of fibres of the wood cut across, varying with the angle at which the sound-holes cross the grain of the wood. Their position is that in the middle of the central vibrating portion of the belly under the bridge.

All these important factors are influenced by the quality and elasticity of the wood employed.

The choice has been wide, but many speculations have been advanced with regard to the superiority in tone of the old Italian instruments over those of modern construction. This superiority has sometimes been disputed, and, judging from the many examples of fine-rate instruments which have survived from the 17th and 18th centuries, it is certain that antiquity alone does not confer upon violins the merits which have been frequently claimed for them. However, we have the inner outline of the specimens of the Italian school which have survived in good condition, with the best examples of modern construction in which the proportions of the older masterpieces have been faithfully followed, and which are most carefully and skilfully made. If it be true, as it seems to be, it cannot be denied that the former possess a superiority in the quality of their tone which the musical ear immediately recognizes. After taking into account the practical identity in dimensions and construction between the classical and modern, the best modern models, the conclusion suggests itself that the difference must be attributed to the nature of the materials used, or to the method of their employment, as influenced by local conditions and practice. The argument, not infrequently advanced, that the great makers of Italy had special local sources of supply, jealously guarded, for wood with exceptional acoustical properties, can hardly be accepted.

Undoubtedly the excellence of the Italian violins has been ascribed in a good measure to the condition of sound and handsome wood; but there is evidence that some of the finest wood they used was imported from across the Adriatic, and there is every reason to believe that in all probability, largely one of expense. There is good reason to suppose that a far larger choice of equally good material is accessible to modern makers.

The varnish with which the completed instrument is coated. This was an item in the manufacture which received most careful attention at the hands of the great masters, and much importance has been attached to the superiority of their varnish over that used in more recent times—so much so that its composition has been attributed to secret processes known only to themselves. The probability is that they were able to exercise more personal skill in the manipulation of the materials used than has been generally practiced by makers dependent upon commercial products under modern conditions, and the general result has been analogous to that seen in the pigments employed by modern painters as compared with those of the old masters. In this connection the perfection of the varnish is indispensable. But that the Italian makers individually or collectively attempted, or were able, to preserve as a secret the composition of the varnish they used is unlikely. Probably they have exhibited to their pupils and to each other a list of materials, so as to keep the industry so flourishing as that of violin-making in the 17th and early 18th centuries. The excellence of an instrument in respect of its varnish depended on the quality of the constituent materials, on the methods in which they were prepared, and finally on the method of its application. The most enduring and perfect varnish used for violins is an oil varnish, and the best results therefore generally the result of the use of linseed oil under vigorous application for the drying process. In this respect there can be no doubt that the southern climate placed the makers whose work lies in higher latitudes at a disadvantage. In a letter to Galilei in 1658 concerning a violin he had ordered from Cremona, the writer states that
"it cannot be brought to perfection without the strong heat of the sun"; and all recorded experience indicates the great importance of slow drying of the varnish under suitable conditions. Stradivari himself wrote to account for delay in the delivery of an instrument because the varnish was not yet dry. He also stated that the belly is close to the foot of the bridge, under the fourth string while that of least vibration is exactly over the top of the sound-post. The back, which is strongly agitated, also has its least vibration where the sound-post rests upon it. With the sound-post removed, the back is observed to vibrate more vigorously, while the vibration of the back was very feeble, and the tone became very poor; supporting the view that in the complete instrument the sound-post is as essential to the tone as the bridge is to the sound-post. Pressure on that point in the belly normally in contact with the top of the sound-post partially restored the proper character though not the power of the tone; indicating the influence of the place of the pressure, and the consequent oscillation, in determining largely the normal vibration of the belly. Modifications of the material of which the sound-post was made produced a profound effect upon the quality, but comparatively small effect upon the intensity of the sound; and it is the latter that is shown to be the most important part of the sound-post, from the point of view of transmitting vibrations from belly to back, the most important source is borne by the middle bouts, or incised sides at the waist of the instrument.

Experiments made lately afford some interesting evidence as to the nature of the vibrations set up in a sounding-box in response to those of a string at various pitches and under various conditions. These observations were made on a monochord and restricted to one portion of a sounding-board of regular shape. Experiments on similar lines made with an actual violin body might throw further light upon the behaviour of that instrument as a resonating body, if only sufficiently elaborated.

Two phenomena, familiar to violin players, are suggestive of further lines of research that may help to elucidate the problems of their origin. They are the peculiar feel of an old violin, and of the action of the wood under vibration. Many violins, especially old and inferior ones, fail to resonate clearly and fully to particular notes, the sounds produced being commonly known as "dead" or "stiff." The quality is due, it is said, to the way the wood is chosen and possibly always, associated with particular spots in the body of the instrument; for, if pressure be applied at these spots, the resonance of the respective string is greatly improved. This observation suggests that the region concerned has been, or has become disproportionately thin in relation to the normal thickness of the plate; and, when stimulated by the appropriate note, it cannot vibrate freely, as it would in a fresh violin, but is allowed to share, the proper vibrations of the plate as a whole; this interfering vibration being damped by local pressure. These defects are said to develop with age and constant use, and to be minimized by the use of thin strings but possibly by other means.

Detailed investigation of these phenomena on the lines of the experiments already referred to may have valuable results. Another well-known characteristic of the violin is that a new instrument, or one that has been played a great deal, has a double "sleeping" or "vibrato" note, which can be produced by a sharp blow on the body. This is due to the normal degree of rigidity after a period of rest. No conclusive interpretation of these experiments has yet been offered; but they indicate the probability of modifications of the internal viscosity and elasticity conditions which may affect the sound of the instrument.

The function of the bridge, as above mentioned, is to communicate the vibrations of the strings to the resonating body of the violin. The bridge is not free, but is fixed round the whole edge of a very irregular outline; and these conditions, together with those due to the arched plate and the unequal thickness of the plate, produce a system of stresses which are complicated by the deflection of the bridge under pressure in bending. This is the case in all modern bridges, whether of the straight or of the arched type; the bridge has been shown to be of great relative importance in determining the final result; it is, in fact, a device for distributing the normal stresses in bending above. In most modern bridges, the upper bouts are slightly smaller than the lower; so that the upper edges of the plates do not rest on the bridge, but the two plates converge in the direction of the head. Probably the most successful attempts at analysing the vibrations of the violin have been those made by Sir William Huggins, by means of photographic and x-ray methods; his experiments have been confirmed by Sir William Huggins, namely, that the strings, when at the bow, vibrate in a plane oblique to the vertical axis of the bridge; the vibrations may be accordingly resolved into vibrations parallel to and at right angles to this line. One of the strings to which the other is perpendicular—that is, in a direction favourable for setting the belly into vibration across its lines of support.
the transverse vibrations before they reach the belly. This is accomplished by a certain lateral elasticity of the bridge itself, attained by under-cutting the sides so as to allow the upper half of the bridge to oscillate or rock from side to side upon its central support, having done in setting up this oscillation absorbing the transverse vibrations above mentioned.

The function of the sound-post is on the one hand mechanical, and on the other acoustical. It serves the purpose of sustaining the greater share of the pressure of the strings, not so much to save the belly from yielding under that pressure, as to enable it to vibrate more freely in its several parts than it could do, if unsupported, under the stresses in which would be set up in its substance, already shown, its principal function. The post also by its contact with both vibrating plates is, as already shown, a governing factor in determining the nodal division of their surfaces, and its position therefore influences fundamentally the related states of vibration of the two plates of the instrument, and the compound oscillations set up in the contained body of air. This is an important element in determining the tone character of the instrument.

The immediate ancestors of the violins were the viols, which were the principal bowed instruments in use from the end of the 15th century. History: 15th to the end of the 17th century, during the latter part of which period they were gradually supplanted by the violin. The viols were of a similar nature to the violins, until towards the later part of the 18th century, when the general adoption of the larger pattern of violoncello drove the violin from the field it had occupied so long. The sole survivor of the viol type of instrument, although not itself an original member of the family, is the double bass of the modern orchestra, which retains many of the characteristic features of the viol, notably the flat back, with an oblique slope at the shoulders, the high bridge and deep ribs. Exciting the marble trumpet or bowed monochord, we find in Europe no trace of any large bowed instruments before the appearance of the violin. When the violin began to be used, the middle ages being all small enough to be rested on or against the shoulder during performance. The viols probably owe their origin directly to the minnesinger fiddles, which possessed several of the typical features of the violin, as distinct from the guitar family, and were sounded by a bow. These in their turn may be traced to the "guitar fiddle" (q.v.), a bowed instrument of the 13th century, with five strings, the lowest of which was longer than the rest, and was attached to a peg outside the head so as to clear the nut and finger-board, thus providing a fixed bass, or bourdon. This instrument, like all other specimens, had been published by the English Musical Antiquarian Society. Later, the viols, especially the bass, were employed as solo instruments, the methods of composition and execution being based on those of the lute. Most lute music is in fact equally adapted for the bass viol, and vice versa. In the 17th century, when the violin was coming into general use, constructive innovations began which resulted in the abandonment of the trio of pure six-stringed violins. Instruments which show these innovations are the quinton and the viola d'amore. The first-mentioned is of a type intermediate between the viol and the violin. In the case of the quinton and tenor viol the lowest string, which was probably found to be of little use, was abandoned, and the pressure on the bass side of the belly thus considerably lightened. The five strings were then spread out, as it were, to the compass of the six, so as to retain the fundamental principle of the outer strings being two octaves apart. This was effected by tuning the lower half of the instrument in fifths, as in the violin, and the upper half in fourths. This innovation altered the tuning of the treble and tenor viols, and in the case of the instrument was therefore tuned like a violin, the other half as in a violin, the middle string forming the division. The tenor viol thus improved was called in France the quinte, and the treble corresponding to it the quinton. From the numerous specimens which survive it must have been a popular instrument, as it is undoubtedly a substantially excellent one. The
relief in the bass, and the additional pressure caused by the higher tuning in the treble, gave it greater brilliancy, without destroying the pure, ready and sympathetic tone which characterizes the viol. While the tendency in the case of the discant and tenor was to lighten and brighten them, the reverse process took place in that of the bass. The richer and more sonorous tones of the viola da gamba were extended downwards by the addition of a string tuned to double bass A. A Marcel, a French virtuoso, is usually credited with this improvement; and this extended compass is recognized in the classical viola da gamba writings of Sebastien Bach and De Caix d'Hercule.

The result, however, was not universally satisfactory, for Abel used the six-stringed instrument; and the seven strings never came into general use in England, where the viol da gamba was more generally employed and survived longer than elsewhere.

The chief defect of the viol was its weakness of tone; this the makers sought to remedy in two ways: first by additional strings in unisons, thirds and octaves; and secondly by sympathetic strings of fine steel wire, laid under the fingerboard as close as possible to the belly, and sounding in sympathy with the notched string to which they were attached. These sympathetic strings were attached to ivory pegs driven into the bottom block, and, passing through the lower part of the bridge, or over a very low bridge of their own, were stretched to pitch either by means of additional pegs or by wrist pins driven into the sides of the head, and tuned with a key. Originally six, seven or eight wire strings were used, tuned to the diatonic scale of the piece to be performed. Later on a chromatic set of twelve was employed, and occasionally viols were made with twenty-four wire strings, two for each semitone in the scale. This system of reinforcement was applied to all the various sizes of viol in use during that period.

The improvements which resulted in the production of the violin proceeded on different lines. They consisted in increasing the resonance of the body of the instrument, by making it lighter and more symmetrical, and by stringing it more lightly. These changes transformed the body of the violin into that of the violin, and the transformation was completed by rejecting the lute tuning with its many strings, and tuning the instrument by fifths, as the fiddle had been tuned. The tenor violin appears to have been the first instrument in which the change was made, and thus the viola or treble viol, as it is now generally known, claimed as the father of the modern violin family. Violas were used in church music before the modern violin period, and violins as we know them were at first called "Piccoli Violini" to distinguish them from the earlier and larger instruments. A tenor viol of date 1500 is still extant, bearing in general outline the typical features of the violin, as distinct from the viol family. This instrument was exhibited in 1872 in the Loan Exhibition of Musical Instruments at South Kensington with the label "Pietro Zanure, Brescia, 1500." From existing specimens we know that a bass violin, precursor of the violoncello, with a tuning an octave below the tenor, appeared shortly after that instrument. A double bass violin, tuned a fourth below the violoncello and usually known as the "basso da camera," completed the set of instruments in violin shape; but from the difficulty attending its manipulation it never came into general use. The celebrated double bass viol, occasionally used: the "basso da camera," and an English player named Hancock, who dispensed with the highest or E string, is still remembered for his performances on this unusual instrument.

The tenor and violoncello are made on the same general model and principles as the violin, but with modifications. Both are, relatively to their pitch, made in smaller proportions than the violin, because, if they were constructed to dimensions having the same relation to pitch and tension of strings as the violin, they would not only have an overpowering tone but would be unmanageable from their size. These relatively diminished dimensions, both in the size of the instrument and in the thickness of the wood and strings, give to the tenor and violoncello a graver and more sympathetic tone. To some extent the reduced size is compensated for by giving them a greater proportional height in the ribs and bridge; an increase hardly perceptible in the tenor, but very noticeable in the violoncello. To lighten the tension and thus allow greater freedom of vibration to the belly on the bass side, as with the lowest string of the violin, the two lowest of the tenor and violoncello are made of thin gut, covered with fine metal wire; thus providing the necessary weight without inconvenient thickness. If the tension of the lowest string, or the two lowest strings, be increased, not only will they be elevated in pitch, but the violin will produce a more powerful tone; if the bass string be lowered, the contrary will take place. By adapting the music to this altered tuning (scordatura) some novel effects are produced. The following are the principal scordature which have been occasionally employed by various players:

The violoncello is less amenable to the scordatura than the violin; the only classical instance is the tuning employed by Bach in his fifth sonata, which consists in lowering the first string by a tone.

The early Italian school is chiefly represented by the Brescian makers, Gaspar da Salò, Giovanni Paolo Maggini, Givolta Rodiani and Zanetto Peregrino. It is, however, somewhat misleading to denominate it the Brescian school, for its characteristics are shared by the earliest makers of Cremona, and Venice. To eyes familiar with the geometrical curves of the later Cremona school, most of the violins of these makers have a rude and uncoeh apparent. The height of the model varies; the pattern is attenuated; the f-holes share the general rudeness of design, and are set high in the pattern. Andreas Amati of Cremona, the eldest maker of that name, effected some improvements on this primitive model; but the violin owes most to his sons, Antonio and Geronimo, who were partners. They introduced the substantial improvements which developed the Brescian violin into the modern instrument. These improvements were in their inception probably of an artistic rather than a scientific nature. Painting and inlaying had long been employed in the decoration of strings instruments; but the brothers Amati were the first who applied to the violin the fundamental law of decorative art, that the decorative and constructive elements should be blended in their conception: in other words, the construction should be itself decorative and the decoration itself constructive. Nicholas Amati (1596–1654), son of Geronimo, made some slight improvements in the model, and his pupil Antonio Stradivari (1644–1737) finally settled the typical Cremona pattern, which has been generally followed; for the majority of violins since made, whether by good or bad makers, are copies of Stradivari. Besides the last-named, the following makers worked generally on the Amati model—Cappa, Gobetti, the Grancino family, Andreas Guarnieri and his son Giuseppe, the Ruggeri family and Serafin of Venice. The Bergonzi family, Alessandro Gagliano, the earlier members of the Guarnerini family, and Panormo were either pupils or followers of Stradivari. But excepting Carlo Bergonzi and Stradivari’s two sons, Omobono and Francesco, there is no evidence of
any having actually worked with or for him. Landolfi, Storioni, and Carlo Giuseppe Testore, a pupil of Giovanni Grancino, leaned to the model of Giuseppe Guarneri del Gesù. Some resemblances, especially in the matter of the varnish, are traceable between the works of makers who lived contemporaneously in the same town, e.g. in Naples, Milan and Venice.

A high model was adopted by Jacob Stainer of Absam, near Hall in Tirol, whose well-known pattern was chiefly followed by the makers of England, Tirol and Germany, down to the middle of the 18th century. It therefore formed the immediate prototype of the Cremona violin. The school of Stainer is represented by Albani, Horstein, the Klotz family (who made large numbers of instruments excellent in their kind), Schorn of Salzburg and Witham of Nuremberg, and others. The English makers may be divided into three successive groups: (1) an antique English school, having a character of its own (Rayman, Urquhart, Pamphilon, Barak Norman, Duke, of Oxford, &c.); (2) imitators of Stainer, at the head of whom stands Peter Wamsley (Smith, Barrett, Cross, Hill, Airton, Nichols, Luxford), whose school of imitations (e.g., the Bocquay, pattern &c.) stands as the model, ultimate or adopted by Stradivari, has survived as the most efficient pattern for all modern instruments. The distinction of degree, of the effects of material differences of an actual kind, and cases approximately little more than a quarter of an inch in the convexity of the belly above the top line of the ribs; but the difference in character of tone of the two types is, in the main, well marked. Speaking generally, the tone of the high-built instrument is less powerful and sweeter, and it speaks more readily, but responds less completely to gradations of tone under the action of the bow than the higher type, which yields a tone of greater carry and also of greater intensity, susceptible to more subtle modification by the player, and with a peculiar penetrating quality lacking in the highly archd model. These differences in tone probably depend less on the position of the sound-holes or sound-post, than on the incidental effects of cutting the wood to the higher or lower arch; for it would seem that the best results in tone have been attained in instruments with a fairly constant volume of chamber, and with the sides neither highly increased in proportion to the height of arch in the best examples of the different models. In the high-cut arch the fibres of the wood on the upper surface are necessarily cut shorter, with the result that the plate as a whole does not vibrate so perfectly as in the flatter model, and this has a weakening effect on the tone. Again, the higher arch, with steeper curves towards the sides, necessitates the inclination of the sound-holes at a considerable angle to the main horizontal plane of the instrument; and it is conceivable that, under such conditions, the vibrations of the upper layer of air within the body are dissipated too readily, before the composite vibrations of the whole mass can be brought to bear in their concentrated effect upon the chord of the bow. Apart from these acoustical considerations, the question is probably one of material, the flatter construction demanding the use of a very strong and elastic wood in relation to the most suitable thickness, in order to withstand the pressure of the bridge, a resistance which the higher arch renders possible with a stiffer and more brittle material; and the effect of these qualities upon tone must be taken into account in estimating the tone characters of the two types of instrument.

Broadly speaking, the higher-arched type found favour with the earlier makers up to the end of the Amati period. Stainer in Tirol inclined a little to the Italian, and in England, under the direction of this head, which left little doubt in this regard, directions of this kind, whether in England, in Italy or in France, to have developed on independent lines, the tradition that he learnt his craft from the Amati being no longer tenable. The fakers of the late 18th century and earlier in his age to some extent maintained the immediate influence of the Amati and developed on his own incomparable lines a somewhat larger and more powerful instrument, adapted to the requirements of the increasing class of solo players.

The violins as a distinctive family of instruments cannot be fully discussed without reference to the bow (q.v.) as an essential adjunct, on account of the very important part taken by the bow in determining, as already mentioned, the peculiar form of the vibrations of the string, and in controlling, in the hands of a skilled player, the subtle gradations of tone produced from the instrument. The evolution of the modern bow has taken place almost entirely since the violin attained its final form, and has followed, more completely perhaps than the instrument itself, the development of violin music and the requirements of the player. It attained its highest perfection at the hands of the celebrated François Tourte of Paris. The bow, produced and copyrighted as a model for all succeeding makers, even more exclusively than the violins of Stradivari controlled the pattern of later instruments; and at the present time Tourte bows are valued beyond any others.

For more than 250 years the violin and its larger brethren have held the leading position among musical instruments. For them have been written some of the most inspired works of the great musicians. Famous composers, such as Tartini, Corelli, Spohr and Viotti have been great violinists, and by their composition have largely developed the capacity of the violin as a vehicle of profound musical expression. To the listener the violin speaks with an intensity, a sympathy, and evokes a thrill in the senses that no other instrument can produce. For the player it seems to respond to every pulse of his emotions.

VIOLLET, PAUL MARIE (1805— ), French historian, was born at Tours on the 24th of October 1840. After serving his native city as secretary and archivist, he became archivist to the national archives in Paris in 1856, and later librarian to the faculty of law. In 1856 he was appointed professor of civil and canon law at the École des Chartes. His work mainly concerns the history of law and institutions, and on this subject he published two valuable and scholarly books—Droit public: Histoire des institutions politiques et administratives de la France (1890—8), and Précis de l'histoire du droit français (1886).

VIOLLET-LE-DUC, EUGÈNE EMMANUEL (1814—1879), French architect and writer on archaeology, was born in Paris on the 21st of January 1814. He was a pupil of Achille Leclère, and in 1836—37 spent a year studying Greek and Roman architecture in Sicily and Rome. His chief interest was, however, in the art of the Gothic period, and, like Sir Gilbert Scott in England, was employed to "restore" some of the chief medieval buildings of France, his earliest works being the abbey church of Vézelay, various churches at Poissy, St Michel at Carcassonne, the church of Semur in Côte-d’Or, and the fine Gothic town halls of Saint-Antoin and Narbonne, all carried out between 1840 and 1850. From 1845 to 1856 he was occupied on the restoration of Notre Dame in Paris in conjunction with Lassus,1 and also with that of the abbey of St Denis. In 1849 he began the restoration of the fortifications of Carcassonne and of Amiens cathedral, and in later years he restored Lourdes cathedral, the château of Pierrefonds and many other important buildings. He was an intimate friend of Napoleon III., and during the siege of Paris (1871) gave valuable help as an engineer to the beleaguered army. He held many important offices, both artistic and political, and was for many years inspector-general of the ancient buildings throughout a large part of France. His last work was the general scheme

1He published in 1867—69 a fine work showing his not very successful coloured decoration applied to the chapels of Notre Dame.
for the Paris exhibition buildings in 1878. He died on the 17th of September 1879 at Lausanne.

As a designer Viollet-le-Duc occupied only a secondary place; but as a writer on medieval architecture and the kindred arts he takes the highest rank. His two great dictionaries are the standard works in their class, and are most beautifully illustrated with very skilful drawings by his own hand. Viollet-le-Duc was a man of the most varied and brilliant abilities, endowed with a power of work which has seldom been equalled. He was at once an artist, a man of science, a learned archaeologist and a scholar. The map in his Le Massif du Mont Blanc, showing the rock contours and the glaciers of Mont Blanc, is a model of its kind, which combines great artistic beauty with the accuracy of the most skilful engineer. His strong poetical fancy enabled him to reconstruct and buildings of the middle ages in the most vivid way.

His principal literary works were the Dictionnaire de l'architecture française du XI. au XVI. siècle (1854-68); Dictionnaire du mobilier français (1858-75); L'Architecture militaire au moyen âge (1854); Entretiens sur l'architecture (1865-72); Cités et ruines américaines (1869); Mémoire sur la défense de Paris (1871); Habitations modernes (1874-77); Histoire d'une maison (1875); Histoire d'une cité (1876); Le Massif du Mont Blanc (1876); L'Art russe (1877); Histoire d'un hôtel-de-ville et d'une cathédrale (1878); La Décoration appliquée aux édifices (1879); as well as many minor works dealing with separate buildings.

VIOLONCELLO (Fr. violoncelle, Ger. Violoncell, Ital. violoncello), the bass member of the violin family. Although the word violoncello is a diminutive, signifying "small violone," or double bass, the instrument is really a bass violin, formed on a different model from the violoncello, which has the sloping shoulders and flat back of the viol family, whereas those of the violoncello are rounded as in the violin. The construction of the violoncello is therefore the same as that of the violin (q.v.), but on a much larger scale. It is either held, on account of its size, between the performer's knees, or rests on the floor supported on a foot or spike.

VIONVILLE, a village of Lorraine, between Metz and the French frontier, celebrated as the scene of the battle of Vionville (Rezonville or Mars-la-Tour), fought on the 16th of August 1870 between the French and the Germans (see METZ and FRANCE, German War).

VIOTTI, GIOVANNI BATTISTA (1755-1824), Italian violinst and musical composer, was born at Fontanetto in the province of Turin on the 23rd of May 1755. He learned the rudiments of music from his father, a blacksmith who played the horn; and in 1764 Giovannini taught him the violin for a year. Two years later he was placed at the cost of the prince de la Cisterne under the violinist G. Pugnani at Turin, where he became violinist in the court chapel. In 1780 Viotti, having already made himself a name, travelled through Germany and Poland to Russia, where the empress Catherine honoured him with marks of extraordinary favour. He next appeared in London, in company with Pugnani, and at once achieved a brilliant and lasting reputation. In 1782 he was equally successful in Paris. Two years later he was appointed leader of the prince de Soubise's private orchestra; and in 1785 he undertook the direction of the opera, raising the performances, with Cherubini's assistance, to a very high level. He had also started an Italian opera in co-operation with the barber Léonard, which was opened in 1789 in the Tuileries, being subsequently amalgamated with the Théâtre de la Foire St. Germain in 1790 and finally merged in the new Théâtre Feydeau in 1791. In 1791 the Revolution compelled Viotti to fly to London, where he took part in the Hanover Square concerts; but being suspected to be an agent of the Revolutionary Committee in Paris he was compelled to retire for a time to the neighbourhood of Hamburg, which he subsequently quitted, although the date of his departure, often given as 1795, does not seem probable. It is possible that he was already in 1794 in London, where he took shares in a wine business, and he resided almost uninterrupted there until 1819, when he once more settled in Paris, resumed the direction of the opera, and retired in 1822 with a pension. He died in London on the 10th (or 3rd) of March 1824.

Viotti's playing was distinguished by an extreme purity of style, a magnificent tone, and an inexhaustible variety of poetical and imaginative expression. Among his works are 29 violin concertos, a series of symphonies concertantes for two violins, 45 duos, 18 trios and 21 quartets, and a great number of sonatas, nocturnos and other instrumental works. His school was worthily perpetuated by his pupil Rode.

VIPER. The vipers constitute a family of Old-World poisonous snakes, with a pair of poisonous fangs in the maxillary bones, which are short and movable. The main anatomical features are described in the article SNAKES. In the present article only the Viperinae, namely those without an external pit between the eye and the nose, are described. Pit vipers, or Crotalinae, are treated under SNAKES, and those which are possessed of a rattle under RATTLESNAKE. The true vipers comprise about nine genera with some forty species, which can be distinguished as follows:

Causus in Africa, and Asempodium feae in Burma, are the only vipers which have the head covered with large symmetrical shields, while in the other genera the head shields are broken up into small shields, or into still more numerous scales. C. rhombobothus, common from the Gambia to the Cape.

Atheris, small burrowing snakes in Africa, without post-frontal bones.

Echis and Atheris have only one row of subcaudal shields. E. carinata, scarcely exceeding 20 in. in length, is very poisonous and easily overlooked on account of its light brown coloration, with pale spots and delicate markings on the keels of the scales of the back. It is a desert type, having the lateral scales strongly keeled and directed downwards, by means of which it shuffles itself into the sand; by folding itself and rubbing itself together

![Pearson Jr.](image)

Fig. 1.—Echis carinata. The "Krait" of India.

it produces a rustling sound. It ranges from India, where it is known as the "Krait," called "Kuppur" in Sind, through North Africa. This desert type is replaced farther south in Africa, where vegetation flourishes, by the closely allied genus, Atheris, which, however, possesses a prehensile tail and vivid coloration and has assumed truly arboreal habits.

Cerastes is another desert form, but is restricted to Africa; the arrangement of the scales of the sides of the body is similar to that of
**VIRBIUS**, an old Italian divinity, associated with the worship of Diana at Aricia (see DIANA). Under Greek influence, he was identified with Hippolytus (q.v.), who after he had been trampled to death by the horses of Poseidon was restored to life by Asclepius and removed by Artemis to the grove at Aricia, which horses were not allowed to enter. Virbius was the oldest priest of Diana, the first “king of the grove” (Rex Nemorensis). He is said to have established the rule that any candidate for the office should meet and slay in single combat its holder at the time, who always went about armed with a drawn sword in anticipation of the struggle. Candidates had further to be fugitives (probably slaves), and as a preliminary had to break off a bough from a specified tree. By the eponymous nymph Aricia, Virbius had a son of the same name, who fought on the side of the Rutulian Turnus against Aeneas. J. G. Frazer formerly held Virbius to be a wood and tree spirit, to whom horses, in which form tree spirits were often represented, were offered in sacrifice. His identification with Hippolytus and the manner of the latter’s death would explain the exclusion of horses from his grove. This spirit might easily be confounded with the sun, whose power was supposed to be stored up in the warm-thriving tree. Sauer (in Roscher’s Lexikon) also identifies which are hunted after sunset. They cannot climb and they avoid going into water. The pairing takes place from March to May.

**FIG. 3.—Bitis nasicornis.**

**FIG. 2.—Atheris burtoni.** (Length, 12 in.) in his back. He, however, appeared not to suffer the slightest inconvenience, and was never the worse for it (see Proc. Zool. Soc. 1871, p. 635).

**Vipera.**—The head is covered with small scales and a few larger shields. The eye is separated from the labials by small scales; the nasals are in contact with the rostral and are separated by one naso-rostral. The scales of the body are strongly keeled; two rows of subcaudals on the short tail. This genus of about ten species with numerous local varieties ranges over Europe, Asia and the greater part of Africa.

**V. borus,** the common European viper, ranging from Wales to Sikkim and from Caithness to the north of Spain, from the northern boundary of Persia to beyond the Arctic circle in Scandinavia. It inhabits all sorts of situations, but prefers heaths, moors and mixed woods with sunny slopes. It ascends the Alps up to 6000 or 7000 ft. The coloration is very variable, grey, brown, reddish or entirely black. Some occurring in the same country. The much-spoken-of black zigzag line along the back is so often indistinct, that it cannot be relied upon as a safe character. The fully grown males are smaller than the females, and have usually darker markings and a lighter ground colour. A specimen which is 2 ft. long is rare, and is invariably a female. The chief food is mice, and the young are born about four months later. During the pairing, and for hibernation, they often collect in considerable numbers. Whilst most snakes readily take proper food in captivity, these vipers prefer starving themselves to death, a feat which they accomplish within six to nine months according to conditions. As a rule their bite is not fatal to man, but the consequences are often serious and protracted. For treatment see SNAKES.

**V. aspis** is the more southern and western continental European viper; it is slightly snout-nosed, and this feature is still more pronounced in **V. latastei** of Spain and Portugal. In **V. ammodytes** of south-eastern Europe the raised portion is produced into a soft, scaly appendage. **V. russelli,** the “Daboiya,” is one of the most poisonous snakes of India, Ceylon, Java, Burma and Siam. It is pale brown with three longitudinal series of black, light-edged rings which encircle reddish spots. It grows to a length of about 5 ft.

(H. F. G.)

_Echis_, but it has two rows of subcaudals. _C. cornutus_, the “horned viper” of North Africa, is from Algeria to Palestine, has a large horned spike above each eye. This, the “Elfa” of the Arabs, buries itself in the sand, with only the eyes, nostrils and the horns appearing above the surface. It attains a length of 2 ft. _C. vipea_ is hornless. _Bitis s. Echidna s. Clotho_ has two rows of shields on the underside of the very short tail; the thick head is much depressed, like the body. The nasal shields are separated from the rostral by small scales, otherwise much resembling the genus _Vipera_. _B. arietans_, the “puff-adder” of nearly the whole of Africa, an ugly, very dangerous brute growing to a length of 4 or 5 ft. _B. nasicornis_, the West African nose-horned viper, has a pair of erectile scales on the nose. Scarcely smaller and less bulky than the puff-adder and just as poisonous, it is yet very handsomely marked with a reddish or purplish ground. Especially handsome are the young, which at birth are as much as 1 ft. in length. On one occasion one of these snakes, after giving birth to twenty-one young (which hit and killed mice within five minutes of being born), became very ill-tempered, and when two adult males were placed in her cage she bit one with such violence as to break off one of her fangs, which she left, about three-quarters of an inch in length, sticking
Hippolytus with the "health-giving sun," and Virchow with a healing god akin to Asclepius. Frazer's latest view is that he is the old cult associate of Diana of Aricia (to whom he is related as Attis to Cybele or Adonis to Venus), the mythical predecessor or archetype of the kings of the grove. This grove was probably an oak grove, and the oak being sacred to Jupiter, the king of the grove (and consequently Virchow) was a local form of Jupiter. A. B. Cook suggests that he may be the god of the stream of Nemi.

**VIRCHOW, RUDOLF** (1821-1902), German pathologist and politician, was born on the 13th of October 1821 at Schivelbein, in Pomernia, where his father was a small farmer and shopkeeper. As a boy he attended the *Volkschule* of his native village, and at the age of seventeen, having passed through the gymnasium of Köslin, went to Berlin to study medicine. He took his doctor's degree in 1843, and almost immediately received an appointment as assistant-surgeon at the Charité Hospital, becoming pro-rector three years later. In 1847 he began to act as Privatdozent in the university, and founded with Reinhardt, the *Archiv für pathologische Anatomie und Physiologie, which, after his collaborator's death in 1852, he carried on alone, and in 1858 he founded and edited a series of which the first volume was published in 1852. He began to investigate an outbreak of typhus in upper Silesia. About the same time, having shown too open sympathy with the revolutionary or reforming tendencies of 1848, he was for political reasons obliged to leave Berlin and retire to the seclusion of Würzburg, the medical school of which profited enormously by his labours as professor of pathological anatomy, and secured a wide extension of its reputation. In 1856 he was recalled to Berlin as ordinary professor of pathological anatomy in the university, and as director of the Pathological Institute formed a centre for research whence has flowed a constant stream of original work on the nature and processes of disease. On the 14th of October 1901 his eightieth birthday was celebrated in Berlin amid a brilliant gathering of men of science, part of the ceremonies taking place in the new Pathological Museum, near the Charité, which owes its existence mainly to his energy and powers of organization. On that occasion all Europe united to do him honour, many learned societies sent delegates to express their congratulations, the king of Italy gave him his own portrait on a gold medallion, and among the numerous addresses he received was a sum of vital unities, each of which manifested the characteristics of life, has almost uniformly dominated the theory of disease since the middle of the 19th century, when it was enunciated. The beginnings of his doctrine of cellular pathology date from the earliest period in his career. When, towards the end of his student-days in Berlin, he was acting as clinical assistant in the eye department of the Berlin Hospital, he noticed that in keratitis and corneal wounds healing took place without the appearance of plastic exudation. This observation led him to further work, and he succeeded in showing that in vascular organs the presence of cells in inflammatory exudates is not the result of exudation but of multiplication of pre-existing cells. Eventually he was able to prove that the biological doctrine of *omnis cellula cellula* applies to pathological processes as well as to those of normal growth, and in his famous book on cellular-pathologic, published at Berlin in 1858, he established what Lord Lister described as the "true and fertile doctrine that every morbid structure consists of cells which have been derived from pre-existing cells as a progeny." But in addition to bringing forward a fundamental and philosophical view of morbid processes, which probably contributed more than any other single cause to vindicate for pathology the place which he claimed for it among the biological sciences, Virchow made many contributions to histology and morbid anatomy and to the study of particular diseases. The classification into epithelial organs, connective tissues, and the more specialized muscle and nerve, was largely due to him; and he proved the presence of neuroglia in the brain and spinal cord, discovered crystalline haematoxyl, and made out the structure of the umbilical cord. Medical science further owes to him the classification of new growths on a natural histological basis, the elucidation of leucæma, glioma and lardaceous tumours, and detailed investigations into many diseases—tuberculosis, pyaemia, diptheria, leprosy, typhus, &c. Among the books he published on pathological and medical subjects may be mentioned *Vorlesungen über Pathologie,* the first volume of which was the Cellular-pathologie (1858), and the remaining three *Die Krankheiten der Geschwülste* (1863-67); *Handbuch der speziellen Pathologie und Therapie* (3 vols., 1854-62), in collaboration with other German surgeons; *Gesammelte Abhandlungen zur wissenschaftlichen Medizin* (1856); *Vier Reden über Leben und Kranksein* (1862); *Untersuchungen über die Entwicklung des Schadelgründers* (1857); *Lehre von den Trichinen* (1865); *Die Hungersnöte** (1847, 1848) and *Gesammelte Abhandlungen aus dem Gebiete der öffentlichen Medizin und der Seuchenlehre* (1879). In England his pathological work won general recognition. The Royal Society awarded him the Copley medal in 1802, and selected him as Cronian lecturer in the following year, his subject being the position of pathology among the biological sciences; and in 1808 he delivered the second Hussey memorial lecture at Charing Cross Hospital.

Another science which Virchow cultivated with conspicuous success was anthropology, which he did much to put on a sound critical basis. At the meeting of the Naturforschervereinigung at Innsbruck in 1869, he was one of the founders of the German Anthropological Society, of which he became president in the following year; and from 1869 onwards he presided over the Berlin Anthropological Society, also acting as editor of its proceedings in the *Zeitschrift für Ethnologie.* In ethnology he published a volume of essays on the physical anthropology of the Germans, with special reference to the Frisians; and at his instance a census, which yielded remarkable results, was carried out among school children throughout Germany, to determine the relative distribution of blondes and brunettes. His anthropological work included the investigation of lake dwellings and other prehistoric structures; he went with Schliemann to Troy in 1870, fruits of the expedition being two books, *Zur Landeskunde der Troas* (1880) and *Alt-trojanische Griber und Schädel* (1882); in 1881 he visited the Caucasus, and on his return published *Das Gräberfeld von Koban im Lande der Ostoten*; and in 1888 he accompanied Schliemann to Egypt, Nubia, and the Peloponnesse.

As a politician Virchow had an active career. In 1862 he was elected a member of the Prussian Lower House. Professing a democratic sympathy with the working classes, he became leader of the Fortschrittspartei, and the expression *Kulturkampf* had, it is believed, its origin in one of his electoral manifestoes. For many years he was chairman of the finance committee, and in that capacity may be looked upon as a chief founder of the constitutional Prussian Budget system. In 1880 he entered the Reichstag as representative of a Berlin constituency, but was ousted in 1883 by a Social Democrat. In the Reichstag he became the leader of the Opposition, and a vigorous antagonist to Bismarck. In the local and municipal politics of Berlin again he took a leading part, and as a member of the municipal council was largely responsible for the transformation which came over the city in the last thirty years of the 19th century. That it has become one of the healthiest cities in the world from being one of the unhealthiest is...
attributable in great measure to his insistence on the necessity of sanitary reform, and it was his unceasing efforts that secured for its inhabitants the drainage system, the sewage farms and the good water-supply, the benefits of which are reflected in the decreased death-rate they now enjoy. In respect of hospitals and the treatment of the sick his energy and knowledge were of enormous advantage. Unfortunately, both of peace and of war, and the unparalleled accommodation for medical treatment possessed by Berlin is a standing tribute to his name, which will be perpetuated in one of the largest hospitals of the city.

Of his writings on social and political questions may be mentioned Die Erziehung des Weibes (1865); Über die nationale Entwicklung und Bedeutung der Naturwissenschaften (1865); Die Aufgaben der Naturwissenschaften neuesten Lebens Deutschlands (1871); Die Freiheit der Wissenschaft im modernen Staat (1877), in which he opposed the idea of Haeckel—that the principles of evolution should be taught in elementary schools—on the ground that they were not as yet proved, and that it was mischievous to teach a hypothesis which still remained in the speculative stage.

See Lives by Becher (Berlin, 1894) and Pagel (Leipzig, 1906); Rudolf Virchow ALS Patholog by Marchand (Munich, 1902); Rudolf Virchow ALS Arzt by Esteban (Stuttgart, 1903); Gedächtnisrede auf R. Virchow (Berlin, 1903); and Briefe Virchows an seine Eltern 1830-1864, by Marie Ranib (Leipzig, 1907). A bibliography of his works was published at Berlin in 1901.

VIRE, a town of north-western France, capital of an arrondissement in the department of Calvados, 47 m. S.W. of Caen by rail. Pop. (1906) 6228. Vire stands on an eminence surrounded on three sides by the Vire and crowned by the remains of a 12th-century chateau. The church of Notre Dame (13th to 15th century), and the picturesque Tour de l'Horloge (13th century), beneath which runs the chief street, are the principal buildings. A library and a small museum with good collections of porcelain, pictures and curiosities, are installed in the town hall (17th and 18th centuries). In the public garden there is a statue of Marshal Jacques Goyon, comte de Matignon (1752-1597); and the native poets C. J. L. Chénodolé and P. L. R. Castel are represented, the former by a marble bust, the latter by a bronze statue. Vire grew up around a castle built in the 12th century by Henry I. of England, and in the middle ages was one of the important strongholds of Normandy. South-west of the town is the gorge called Vaux-de-Vire, in which was situated the mill of Olivier Basselin (15th century), the fuller and reputed author of the satiric songs, hence known as “vaudevilles” (see BASSELIN, OLIVIER).

VIRELAY, the title applied to more than one fixed form of verse, from the French verger, to turn or veer. The history and exact character of the virelay are more obscure than those of any other of the old French forms. It is possible that it is connected with the Provençal ley. Historians of poetry have agreed in stating that it is a modification of the medieval lai, but it is curious that no example of the lai is forthcoming, except the following, which was first printed by the Père Mourgues in his Tradit de la Poesie:

But this appears to be, not a complete poem, but a fragment of a virelay, which proceeds by shifting or “veering” the two rhymes to an extent limited only by the poet’s ingenuity. This is the Old Virelay (virelai ancien), of which examples have been rare in recent literature. There is, however, a New Virelay (virelai nouveau), the newness of which is merely relative, since it was used by Alain Chartier in the 15th century. In French the old and popular verses beginning—

The New Virelay is entirely written on two rhymes, and begins with two lines which are destined to form recurrent refrains throughout the whole course of the poem, and, reversed in order, to close it with a couplet. The virelay is a vaguer and less vertebre form of verse than the sonnet, the ballad or the villanelle, and is of less importance than these in the history of prosody.

VIRGIL (Publius Vergilius Maro), the great Roman poet, was born on the 15th of October in the year 70 B.C., on a farm on the banks of the Minio, in the district of Andes, not far from the town of Mantua. In the region north of the Po the race of more imaginative susceptibility than the people of Latium formed part of the Latin-speaking population. It was favourable to his development as a national poet that he was born and educated during the interval of comparative calm between the first and second civil wars, and that he belonged to a generation which, as the result of the social war, first enjoyed the sense of an Italian nationality. Yet it was only after Virgil had grown to manhood that the province to which he belonged obtained the full rights of Roman citizenship. It is remarkable that the two poets whose imagination could have been most powerfully possessed by the spell of Rome—Ennius and Virgil—were born outside the circle of Roman citizenship.

The scenery familiar to his childhood, which he recalls with affection both in the Eclogues and the Georgics, was that of the green banks and slow windings of the Minio and the rich pastures in its neighbourhood. Like his friend and contemporary Horace, he sprang from the class of yeomen, whose state he pronounces the happiest allotted to man and most conducive to virtue and piety. Virgil, as well as Horace, was fortunate in having a father who, though probably uneducated himself, perceived his genius and spared no pains in giving it the best culture then obtainable in the world. At the age of twelve he was taken for his education to Cremona, and from an expression in one of the minor poems attributed to him, about the authenticity of which there cannot be any reasonable doubt, it may be inferred that his father accompanied him. Afterwards he removed to Milan, where he continued engaged in study till he went to Rome two years later. The time of his removal to Rome must have nearly coincided with the publication of the poem of Lucretius and of the collected poems of Catullus.

After studying rhetoric he began the study of philosophy under Siron the Epicurean. One of the minor poems written about this time in the seazon metre tells of his delight at the immediate prospect of entering on the study of philosophy, and of the first stirring of that enthusiasm for philosophical investigation which haunted him through the whole of his life. At the end of the poem, the real master-passion of his life, the charm of the Muses, reasserts itself (Calileption v.). An essential knowledge of him is derived from allusions in the Eclogues, and belongs to a period nine or ten years later. Of what happened to him in the interval, during which the first civil war took place and Julius Caesar was assassinated, we have no indication from ancient testimony or from his own writings. In 42 B.C., the year of the battle of Philippi, we find him “cultivating his woodland Muse” under the protection of Asinius Pollio, governor of the district north of the Po. In the following year the famous confiscations of land for the benefit of the soldiers of the triumvirs took place. Of the impression produced on Virgil by these confiscations, and of their effect on his fortunes, we have a vivid record in the first and ninth eclogues. Mantua, in consequence of its vicinity to Cremona, which had been faithful to the cause of the republic, was involved in this calamity; and Virgil’s father was
driven from his farm. By the influence of his powerful friends, and by personal application to the young Octavian, Virgil obtained the restitution of his land. In the meantime he had taken the undertaking of his family with him to the small country house of his old teacher Siron (Catalpiion x.).

Soon afterwards we hear of him living in Rome, enjoying, in addition to the patronage of Pollio, the favour of Maecenas, intimate with Varus, who was at first regarded as the rising poet of the new era, and later on with Horace. His friendship with Gallus, for whom he indicates a warmer affection and more enthusiastic admiration than for any one else, was formed before his second residence in Rome, in the Cispalpine province, with which Gallus also was connected both by birth and office. The works which are called "Eclogues," commenced in his native district, were finished and published in Rome, probably in 37 B.C. Soon afterwards he withdrew from habitual residence in Rome, and lived chiefly in Campania, either at Naples or in the neighbourhood of Nola. He was one of the companions of Horace in the famous journey to Brundisium; and it seems not unlikely that, some time before 23 B.C., he made the voyage to Athens which forms the subject of the third ode of the first book of the Odes of Horace.

The seven years from 37 to 30 B.C. were devoted to the composition of the Georgics. In the following year he read the poem to Augustus, on his return from Asia. The remaining years of his life were spent on the composition of the Aeneid. In 19 B.C., after the Aeneid was finished but not finally corrected, he set out for Athens, intending to pass three years in Greece and Asia and to devote that time to perfecting the poem. At Athens he met Augustus, and was persuaded by him to return with him to Italy. While visiting Megara under a burning sun, he was seized with illness, and, as he continued his voyage without interruption, he grew rapidly worse, and died on the 21st of September, in his fifty-first year, a few days after landing at Brundisium. In his last illness he called for the cases containing his manuscripts, with the intention of burning the Aeneid. He had previously left directions in his will that his literary executors, Varus and Tucca, should publish nothing of his which had not already been given to the world by himself. This pathetic desire that the work to which he had given so much care, and of which such great expectations were formed, should not survive him has been used as an argument to prove his own dissatisfaction with the poem. A passage from a letter of his to Augustus is quoted, in which he says if he felt that the attaining of the work had been a mistake. This dissatisfaction with his work may be ascribed to his passion for perfection of workmanship, which death prevented him from attaining. The command of Augustus overrode the poet's wish and rescued the poem.

Virgil was buried at Naples, where his tomb was long regarded with religious veneration. Horace is our most direct witness of the affection which he inspired among his contemporaries. The qualities by which he gained their love were, according to his testimony, candor—sincerity of nature and goodness of heart—and pietas—the union of deep affection for kindred, friends, and country with a spirit of reverence. The statement of his biographer, that he was known in Naples by the name "Parthenias," is a testimony to the exceptional purity of his life in an age of licence. The seclusion of his life and his devotion to his art touched the imagination of his countrymen as the finer qualities of his nature touched the hearts of his friends. It had been, from the time of Cicero, 1 the ambition of the men of finest culture and most original genius in Rome to produce a national literature which might rival that of Greece; and the feeling that at last a poem was about to appear which would equal or surpass the greatest among all the works of Greek genius found a voice in the lines of Propertius—

"Cedite Romani scriptores, cedite Grai; Nescio quis majus mascula laudem.

1 Cf. Tusc. Disp. ii. 2: "Quamobrem hortor aemus qui fucem id possunt, ut hujus quoque generis laudem jam launguent Graeciae eripiant," &c. These words apply specially to philosophical literature, but other passages in the same and in other works imply that Cicero thought that the Romans had equal aptitudes for other departments of literature; and the practice of the Augustan poets in each appropriating to himself a special province of Greek literary art seems to indicate the same ambition.
was a religious consecration of all his powers of heart, mind and spirit to his high office.

Virgil's fame as a poet rests on the three acknowledged works of his early and mature manhood—the pastoral poems or Eclogues, the Georgics, and the Aeneid—all written in that hexameter verse which Terence called “the nearest measure to the music of man.”

“The most stately measure ever moulded by the lips of man.”

The pastoral poems or Eclogues—a word denoting short selected pieces—were composed between the years 42 and 37 B.C., when Virgil was twenty and eighteen, respectively, the revision of the first five being made in 34 B.C. By his invitation to the “Sicelides Musae” and “Arethusa,” and by many other indications, he avows the purpose of an allegory, which has led to the germinal criticism of the放进 to a sentiment, the peace.”

aeonk*. dirge supposed, The parallel Mayor, the his his life character of poetic influence. fills of creation celebrates the pieces of Georgia his mature office. is old time. Theocritus was The earliest days of Virgil from the sixth consulship (1907). The first Vergil's date and measure of the Aeneid is probably B.C., and his seventh, with many others, gives the poem "the measure of the things beautiful, if the charm of Virgil's office. The third great work of Virgil is the Georgics, of which he is regarded as the first model, as Virgil's poetic life is the Aeneid, and its treatment of the life of rural habits, the true identities of nature, by the genius and attitude of the philosophical poet. He is possessed by his imaginative conception of nature, as a living, all-pervading power; he shares his Italian love of the beauty of the world, and his sympathy with animal as well as human life. He recognizes with enthusiasm his contemplative elevation above the petty interests and passions of life. But he is remodelled by his apparent separation from the ordinary beliefs, hopes and fears of his fellow-men. Virgil is in thorough sympathy with the best restorative tendencies—religious, social and national—of his time; Lucretius was driven into isolation by the anarcho-syndicalist forces of the day.

So far as any speculative idea underlying the details of the Georgics can be detected, it is one of which the source can be traced in the idea of the new era of peace and plenty, which an allegorist, with a sense of responsibility inspired by the charm of human relationships. Virgil's susceptibility to the beauty of nature appears in the truth with which his work suggests the charm of Italy—the fresh life of an Italian spring; the love of the quiet pastures and orchards of his native district. The representative character of the poem is enhanced by the fidelity and grace with which he has expressed the Italian peasant's love of his home and of all things associated with it. The supreme charm of the description and rhythm is universally recognized. The power of varied harmony is as conspicuous in Virgil's earliest poems as in the mature and more elaborate works. Odes and Eclogues. The language, without sacrifice of the fulness, strength and majesty of its tones, acquired a more tender grace and more liquid flow from the gift—the "molle atque faciem"—of which the Muses of country life adores.

But these Muses had a more serious and dignified function to fulfill than that of glorifying the picturesque pastime, the "otia dia," of the ancient Roman. The Italian imagination formed an ideal of the happiness of a country life far richer than the mere susceptibility to the sights and sounds of the outward world. It is stated that Maecenas, acting on the principle of employing the poets of the first rank in the service of the country, hired a number of them to write poems on the new policy of the new government, directed the genius of Virgil to the subject of the Georgics. No object could be of more consequence in the eyes of a statesman whose master inherited the policy of the ancient Republic. Virgil was emboldened by the predictions of Maecenas, associated with happier memories of Rome, which had fallen into abeyance owing to the long unsettled condition of the revolutionary era as well as the multitude of the "aeonk" destructive invasions. It was natural for him to identify himself with this object, while his genius fitted him to enliven the imagination of his countrymen in its favour. It would be a most inadequate view of his purpose to suppose that, as a patriotic and conservative writer, he desired merely to make useful information more attractive by the aid of verse. His aim was rather to describe with realistic fidelity, and to surround with an atmosphere of poetry, the annual round of labour in which the Italian yeoman's life was passed; to bring out the intimate relation with nature into which man was brought in the course of that life, and to suggest the delight to heart and imagination which he drew from it; to contrast the simplicity, security and sanctity of such a life with the luxury and lawless passions of the great world; and to associate the ideal of a life of rustic labour with the beauties of Italy and the glories of Rome. This larger conception underlay the plan of Virgil in his Georgics, and helped the succession of Virgil from all other didactic, as distinct from philosophic, poems. Virgil has produced in the Georgics a new type of didactic, as in the Aeneid he has produced a new type of epic, poetry.

Virgil accepts also the guidance of the Alexandrian poets who lived in Italy, but the science of the Alexandrians—poetry and geography—in the metre and dictation of epic poetry. But, in avoiding himself of the work of the Alexandrians, Virgil is like a great master making use of mechanical assistants. A more powerful inspiration could be brought to bear on the Georgics than the spirit of Lucretius, yet Virgil considered him as his prototype is shown by the fact that it concludes one of the cardinal episodes of the poem—"Ascreanque cano Romana per oppida carnem."
links and formulas, such as "principio," "nunc age," &c., but uses them more sparingly, so as to make the logical mechanism of his style as manifest as possible. He is as much or more an artist in the use of his materials as a personal address. All his topics admit of being vitalized by attributing to natural processes the vivacity of human relationships and sensibility, and to the imagination the poetry, art, science, and mythology. There is uniformity of chastened excellence in the diction and versification of the Georgics, contrasting with the imaginative force of isolated expressions and the majesty of isolated lines of the Aeneid, and the spirit of the Aeneid is more apparent in the older poet; the artistic perfection of Virgil is even more conspicuous in the Georgics than in the Eclogues or the Bucolics.

The principal episodes of the poem, in which the true dignity and human interest of the subject are brought out, occur in the first and second books. Other shorter episodes add variety to the different pages. These episodes are not detached or isolated ornaments, but give a higher unity to the poem, and are the main ground of its permanent hold upon the world. There is indeed one marked exception to this rule. The long episode with which the whole poem ends—the tale of the shepherd Aristaeus, with which is connected the more poetical fable of Orpheus and Eurydice—has only the slightest connexion with the general ideas and sentiments of the poem, and is altogether without the true realist and the Italian feeling which pervade it. But we are distinctly told that the original conclusion had contained the praises of Gallus, the friend of Virgil’s youth; who, about the time to which this portion of the poem is fixed, was kindled by the war against Cleopatra, and had in consequence been made the first governor of the new province of Egypt. Such a conclusion might well have been kept in the main purpose of the poem. But the fall of Gallus, the Egyptian administration, and his death in 26 B.C., the poet, according to the story, in obedience to the command of the emperor, substituted for this one which the beautiful and irrelevant tale of Orpheus and Eurydice, in which he first displayed the narrative skill, the pathos and the magical power of making the mystery of the unseen world present to the imagination which characterize the Aeneid.

The cardinal episodes of the poem, as it now stands, are the passages in bk. i. from line 464 to the end, and in bk. ii. from 136 to 176 and from 321 to the end. The introduction of the idea with the signs of the weather, recounts the events which accompanied the death of Julius Caesar, and shows how the misery of Italy and the neglected state of the fields are the punishment for the great sin of the previous generation. In the second of these passages the true keynote of the poem is struck in the invocation to Italy—

"Salve, magna parent frugum, Saturnia tellus, / Aeterna umbra!"

The thought of the beauty of the land, the abundance and variety of its products; of its ancient cities and mighty works of man, its brave and hardy races, the great men who had fought for her in old times, and of him, the greatest among her sons, who will never be forgotten against the background of the fable and whose name inspires the poet, and gives dignity to the trivial details of farm life. But a still higher and more catholic interest is given to the subject in the great power that is the most profound passion of all Latin poetry—that from line 458, "O fortunissimum nium," to the end. The subject is there glorified by its connexion not only with the national well-being but with the highest life and purest beauty of man. The old delight in the labors of the arts, the new delight in the beauty of nature, is, and associated with that purity and happiness of life which was an Italian ideal, and with the poetry of those religious beliefs and observances which were the basis of the nation’s life, the security and the environment of the poet’s life, and with the bonds of sympathy to the old rustic life.

The Georgics is not only the most perfect, but the most native of Virgil’s works. With the period of the Revolution, which he describes and celebrates in the Aeneid, there is no such natural connexion. If the Georgics are presented to us as she is revealed in the soft luxuriance of Italian landscape, not in the clearly defined forms of Greek scenery. The poem shows the Italian susceptibility to the beauty of the earth, and the dignity and reserve of the Italian imagination, the firm and enduring structure of all Roman manliness, while it is essentially Italian in its religious and ethical feeling.

A work which yet remained for Virgil to accomplish was the addition of a great Roman epic to literature. This had been the earliest effort of the national imagination, when it first deserted from the mere imitative reproduction of Greek originals. As the genius of Rome before the time of Virgil had been the Annalen of Ennius. This had been supplemented by various historical poems but had never been superseded. It satisfied the national passion for an epic which had been judged worthy of a prime, but it could not satisfy the newly developed sense of art; and the expansion of the national life since the days of Ennius, and the presence of ulterior interests, demanded a newer and more ample expression. It had been Virgil’s earliest ambition to write an epic poem on the traditions of Alla Longa; and he had been repeatedly urged by Augustus to attempt the subject. But the epic verse, which the latter and the existing romantic epic poetry, art, and the science of art, which had been cultivated on a large scale, which should represent a great action of the heroic age, and should at the same time embody the most vital ideas and sentiment of the hour—which in substance should follow closely the great models of epic poetry and reproduce all their sources of interest. It was his ambition to be the Homer, as he had been the Tennyson, of the Augustan age.

Various objects had thus to be combined in a work of art on the model of the Greek epic; the revival of interest in the heroic foretime; the satisfaction of national sentiment; the expression of the deeper currents of emotion of the age; the personal celebration of Augustus. A new type of epic poetry had to be created. It was desirable to select a single heroic action which should belong to the cycle of legendary events celebrated in the Homeric poems, and which could be associated with Rome. The one subject which in any way satisfied these conditions was that of the wanderings of Aeneas and of his final settlement in Latium. The story, though probably of very remote origin, was by this time sufficiently familiar to the Romans, and had been recognized by official acts of senate and people. The subject enabled Virgil to tell again of the fall of Troy, and to weave a tale of sea-adventure similar to that of the Odyssey. For the ideas of it, at least as far as they are concerned in the Aeneid, it is the claim which the Jiuli, a patriarchal family of Alban origin, made to descent from Iulus, the supposed son of Aeneas and founder of Alla Longa.

The Aeneid is thus at once the epic of the national life under its new conditions and an epic of human character. The true keynote of the poem is struck in the line with which the proem closes—

"Tantae mollis erat Romanam condere gentem.

The idea which underlies the whole action of the poem is that of the great part played by Rome in the history of the world, that part being from of old determined by divine decree, and carried out through the virtue of her sons. The idea of universal empire is characteristic of the Augustan age, and the boast of being the first and the most illustrious of Roman emperors, is that of the unbroken continuity of the national life is intimately associated. The reverence for old customs and for the traditions of the past was a large element in the national sentiment, and has a prominent place in the Aeneid. So too has the feeling of local attachment and of the power of local association over the imagination. The poem is also characteristicly Roman in its religious belief and observation, in which the Romans. Behind all the conventional machineries of the old Olympic gods there is the Roman apprehension of a great insinuant power, manifesting itself by arbitrary signs, exacting jealousy certain observances, working out its own secret purposes through the intermediary of unknown personages. The poem is thus a religious as well as a national epic, and this explains the large part played in the development of the action by special revelation, omens, prophecies, ceremonial usages and observances. Through the Aeneid, to the Christian of that age, is that of a divine purpose carried out regardless of human feeling, in other parts of the poem, and especially in that passage of the death of Lucius, in which the idea of the Roman empire on individual destiny, the agency of fate seems to yield to that of a spiritual dispensation, awarding to men their portions according to their actions.

The idealization of Augustus is an expression of servile adulation. It is through the prominence assigned to him that the poem is truly representative of the critical epoch in human affairs at which it was written. The cardinal fact of that epoch was the complete and total revolution in the life of the world, bringing the entire world under the sway of the Roman empire. Virgil shows the imaginative significance of that fact by revealing the emperor as chosen from of old in the counsels of the gods, and as the avenger of the sins of the Romans, and the descendant of gods and of heroes of old poetic renown; as one, moreover, who, in the actual work done by him, as victor in a great decisive battle between the forces of the Western and the Eastern empires, and as the ruler of the empire, of which the ancient religion, had rendered better service to mankind than any one of the heroes who in an older time had been raised for their great deeds to the company of the gods.

The Aeneid is thus a new interpretation of the imperial idea of Rome is the basis of the greatness of the Aeneid as a representative poem. It is on this representative character and on the idea that its admirers have put the date of the Aeneid to rank as one of the great poems of the world mainly rests. The inferiority of the poem to the Iliad and the Odyssey as a direct representation of human life is so unquestionable that we are in
and character. In the first place it should be remarked that the action is chosen not only as suited to embody the idea of Rome, but, as having a peculiar nobleness and dignity of its own. It brings before us the spectacle of the destruction of the city of greatest name, and, proceeding along the island of Italy, including the western seas, in which Rome had encountered its most powerful antagonist in her long struggle for supremacy, and that of the first rule of which the sphere of action is the whole of Italy; the people with which the action is carried familiar, yet full of great memories and associations—Troy and its neighbourhood, the seas and islands of Greece, the coasts of Epirus, familiar to all travellers between Italy and Greece, and, in addition, the most characteristic regions of Latium, the Tiber, and all the country within sight of Rome. The personages of the action are prominent in poetry and legend, or, by their very nature, impart whatever enthusiasm—Aeneas and Anchises, Dido, Acestes, Evander, Turnus. The action in which they are engaged are war and sea-adventure. The passion of love is a powerful addition to the older sources of interest. The Aeneid revives, by a conventional compounding between the present and the remote past, some image of the old romance of Greece; it creates the romance of "that Italy for which Camilla the virgin, Euryalus, and Turnus and Nisus died of wounds." It might be said of the manner of life represented in the Aeneid, that it is no more true to any actual condition of human society than that represented in the Eclogues. But may not the same be said of the life of the ancient human race? and an age of prehistoric civilization? The life represented in the Oedipus Tyrannus of King Lear is not the life of the Periclean nor of the Elizabethan age, nor is it conceivable as the real life of a prehistoric age. The truth lies somewhere in the middle. And if the action is carried to any actual state of things ever realized in the world, but by its relation to an ideal of the imagination—the ideal conception of human endowments, with the gifts and graces of a civilized time, but with none of the forms of that country and age, is it not possible for it to play its part under circumstances which would afford scope for the passions and activities of a vigorous personality, and for the reflection of that age of high civilized life, of moral and mental culture? The verdict of most readers of the Aeneid will be that Virgil does not satisfy this condition as it is satisfied by Sophocles and Shakespeare. Yet there is a courtesy, dignity and respect for the feelings of others in the wild and in the civilized world. If the chief personages, such as might be exhibited by the noblest in an age of chivalry and in an age of culture. The charm of primitive simplicity, the persistence of some passages of the Aeneid, the spell of luxurious pomp in others. The delight of voyaging past the islands is enhanced by the suggestion of the adventurous spirit which sent the first explorers abroad. Where Virgil is least real, and most purely imaginative, is in the battle-scenes of the later books. They afford scope, however, to his patriotic desire to do justice to the martial energy of the Italian races; and some of them have a peculiar beauty from the pathos with which the deaths of some of the Italian chieftains are related.

But the adverse criticisms of the Aeneid are chiefly based on Virgil's supposed failure in the crucial test of the creation of character. The name of Aeneas is pronounced to be the "pious Aeneas." Is Aeneas a worthy and interesting hero of a great poem of action? Not, certainly, according to the ideals realized in Achilles and Odysseus, nor according to the modern ideal of heroism. Virgil with his gift of primitive simplicity, does not attempt to create an ideal hero, but adheres to an obstinate purpose—a religious ideal belonging to the ages of faith combined with the humane and self-sacrificing qualities belonging to an era of moral enlightenment. His own sympathy is with his religious ideal rather than with that of chivalrous romance. Yet that there was in his own imagination a chord responsive to the chivalrous emotion of a later time is seen in the love and pathos which he has thrown into his delineations of Pallas, Lausus and Camilla. But he felt that the deepest need of his time was not military glory, but peace, reconciliation, the restoration of law, order and piety.

In the Latin drama human poetry has added to the gallery of men and women, created by the imaginative art of different times and peoples, the ideal of a true queen and a true woman. On the episode of which she is the heroine the most passionate human interest is concentrated. It is not that she sympathizes with his own creation, that he gives his approval to the cold desertion of her by Aeneas. But if he does not condemn his hero, he sees in the desertion and death of Dido a great tragic issue in which a noble and generous nature is sacrificed to the purpose of the gods. But that Virgil really sympathized with the creation of his imagination appears, not only in the sympathy which shares with Aeneas in the part which he assigns to her in that shadowy realm—

"Conjux ubi pristinus illi
Respeditur curis, aequatur Sycahes amorem."

Even those who have been inaccessible to the representative and to the heroic, will generally recognize the artistic excellence of the poem. This is conspicuous both in the conception of the action and the arrangement of its successive stages and in the workmanship of details. Each of the first eight books has a large and distinct sphere of interest, and they each contribute to the impression of the work as a whole. In the first book we have the storm, the prophecy of Jove and the building of Carthage; in the second the destruction of Troy; in the third the departure of Aeneas; in the fourth the tragedy of Dido; in the fifth the rest in the Sicilian bay, at the foot of Mount Eryx; in the sixth the revelation of the spiritual Aeneid, the imagination, and of the souls of those who built up the greatness of Rome. In the latter, the adventures that precede the arrival of the Trojans at the mouth of the Tiber and the gathering of the Italian clans; in the eighth the first sight of the hills of Rome, the tale of Romulus and Remus, and the story of the poetic and religious history, leading up to the greatest of them all, the crowning victory of Aeneas. Among these books we may infer that Virgil assigned the palm to the second, the fourth, and the sixth, as he selected some of them to add to Augustus' collection of the Virgilian texts, but he is generally thought to fail in the last four books; nor is it possible to feel that the culminating sympathy with the final combat between the Aeneid that he feel with the combat between Hector and Achilles. Yet a personal interest is awakened in the adventures and fate of Pallas, Lausus and Camilla. Virgil may himself have become weary of the succession of battle-scenes—"eadem horrida bella"—which the requirements of epic poetry call upon him to portray. There is not only a less varied interest, there is greater inequality of workmanship in the later books, owing to the fact that they had not received their author's final revision. There are passages that are marked by the pathos and beauty. Virgil brought the two great instruments of varied and continuous harmony and of a rich, chastened and subtle style, the Latin prose of the Georgics and the Latin rhymed verse of the Aeneid, and the medium of meaning which touches the deepest and most secret springs of emotion. He touches especially the emotions of reverence and of yearning for a higher spiritual life, and the sense of nobleness in human affairs, in great institutions, and great natures, the sense of the sanctity of human affections, of the imaginative spell exercised by the past, of the mystery of the unseen world. This is the power with whose words they have over some of the deepest and greatest natures in extent.

BIBLIOGRAPHY

Appendix Vergiliana.—Under this collective name there are current several poems of some little length and some groups of shorter pieces, all attributed to Virgil in antiquity. Virgil wrote a large proportion of them, but not the Culex, but not the Culex now extant, though it passed for half a century after his death. The Aetna, the Ciri and the Copa are clearly not Virgils. The Hortorum has been said to have been translated from Virgil's poem by his teacher Parmenius; it is an exquisite piece of work, familiar perhaps to English readers in Cowper's translation. The case of the Catapæta (cata caro) is peculiar. Two of these little poems (The hinc indites and Villulae) are generally ascribed to Virgil, and, in the case of the last, with very little to go upon, but generally rejecting them. The whole are printed in the larger editions of Virgil. For English readers the most obvious is that of Robinion Ellis (1897), who has also edited the Aetna section of them.

Manuscripts.—Gellius (Noctes Atticæ, ix. 14, 7) tells us of people who had inspected the catalogue libræ Vergilii, but this has of course been destroyed. There is a list of MSS. of Virgil, seven very ancient MSS. of Virgil. (1) The Mediciæ at Florence, with a note purporting to be by a man, who was consul in 494, to say he had read it. (2) The Palatini MSS. of the 4th or 5th century. (3) The Vaticana of the same period. (4) The "Schedæ Vaticanae." (5) The "Schedæ Berolinenses," perhaps of the 4th century. (6) The "Schedæ Sangallenses." (7) The "Schedæ rescriptæ Veronenses"—the last three of insignificant value. Virgil full account of the MSS., see Henry, Aeneida, i., and Ribbeck, Progressus Virgilii. Ancient Commentators.—Commentaries on Virgil began to be written at a very early date. Suetonius, V. Verg. 44. mentions an edition of Carthage, which is not always called Virgil's "thefts" and "faults," besides eight "volumina" of Q. Octavius Avitus, setting out in parallel passages the "likenesses" (hauderes) was the name of the work) between Virgil and more ancient authors. Among these are the anonymous poet of Provus (lost) of the 4th century, and Claudius Donates and of Servius, the former writing as a teacher of rhetoric, the latter as a poet and grammarian. The work of Servius was afterwards expanded by another scholar, whose additions greatly added to its worth, as they are from older MSS. and later MSS. and treatises, and information on the old Roman religion and constitution, Greek and Latin legends, old Latin and linguistic usages. In this enlarged commentary of Servius and the latin antiquitates of Macrobius (also of the end of the 4th century) are both of great interest to the student of Virgil. There are, further, sets of Scholia in MSS. at Verona and Bern, which draw their material from ancient
commentaries. See H. Nettleship, Essays in Latin Literature, xi., and Comparetti, Virgil in the Middle Ages, ch. 5.

Editions.—The editions of Virgil are innumerable; Heyne (1786-92), and Jacoby (1792-93) in Germany; Benoist (1876) in France, and Conington (completed by Nettleship, and edited by Haverfield) in England; they are perhaps the most important. A Latin edition in English has been produced by J. J. Page, Sidgwick and Papillon. Conington's work, however, is without question the best in English.

Translations.—Famous English translations have been made by Dryden (1691) and others. Since the middle of the 19th century the most important are Conington (Aeneid in verse, whole works in prose); J. W. Mackall (Aeneid and Georgics in prose); William Morris (in verse), and William Morris (in verse), both published by the Bowles Typographers and printed in 1898; and Canon Thornhill (verse); C. J. Bilson (verse, 1906); J. Rhoades (verse, new ed., 1907). For essays on translating Virgil, see Conington, Miscellanea, Works, vol. 1; R. A. Stirling (1888) in the T.Q.R.

 Authorities.—For full bibliographies of Virgil consult Schanz, Gesch. der Römischen Literatur (1899) in W. von Müller's series, Handbuch der Klassischen Altertums-Wissenschaft, and Teufel, History of Roman Literature, edited by L. Schwabe and tr. by G. C. W. War (1900). On the life of Virgil: Nettleship's Virgil's Ancient Lives of Virgil (1879) discusses the authorities, printing one of the lives, which he shows to be by Scolotius, the V. als Naturdichter u. Thetist (1880); Cattale, Étude sur les Bucoliques de V. (1879). On the Georgics: Morsch, De Graecis in Georgici s. v. expressa (1878); Norden, V.-studien (in Hermes, vol. 26, 1889); Norden, De Graecis in Georgici s. v. expressa (1897). On the Aeneid: Schwabeg, Röm. Gesch. vol. 1, 1853; Causer, De Fabulis Graecis ad Roman conditam pertinentibus; Hild, La Légende d'Enfante V. (1893); Förstermann, Zur Geschichte der Aeneis des H. de la Ville (in inscriptione Georgنفس و Aehid (1894); Peringer, De Fabulis Graecis ad Roman conditam pertinentibus (1894); Hild, Die politische Tenden der Aeneis (1880); Boissier, Nouvelles promenades archéologiques (1888); trans. André, The Country of Herod and Virgil (1899); Gibbon, Critical Observations on the Sixth Book of the Aeneid (1770); Boissier, La Religion romaine d'Auguste aux Antonins (1884) (with section on sixth Aeneid); E. V. Furneaux (translation of Aeneis (in Hermes, vol. 26, 1889), on sixth Aeneid, and papers in the Jahrbiicher for Alte Altertum. 1981), Dieterich, Neysa (1983) (on Apocalyptic Continuation of Aeneis). See also the following: F. W. H. Myers, Essays [Classical], 1885, the most famous English essay on Virgil; J. R. Green, Stray Studies (1876) (an excellent study of Aeneas); W. Wardle Fowler, A Year with the Bible (1902); Myers, Essays in Petronian Studies (1884); Tyrrell, Latin Poetry (1898); Patin, Essais sur la poésie Latine (4th ed. 1900) (one of the finest critics of Latin literature); Guenot, Les Latins (1892) (a volume of very bright essays); J. W. Mackall, Latin Literature (3rd ed. 1899). (T. G. G.)

The Virgil Legend.

Virgil's great popularity in the middle ages is to be partly explained by the fact that he was to a certain extent recognized by the Church. He was supposed to have prophesied the coming of Christ in the fourth Elegy, and by some divines the Aeneid was held to be an allegory of salvation. His life was very curiously connected with the life of Dante when he chose him from among all the sages of antiquity to be his guide in the Divina Commedia. Ancient poets and philosophers were commonly transformed by medieval writers into necromancers; and Virgil and Aristotle became popularly famous, not for poetry and science, but for their supposed knowledge of the black art. Naples appears to have been the home of the popular legend of Virgil, which represented him as the special protector of the city, and was probably never quite independent of learned tradition.

One of the earliest references to the magical skill of Virgil occurs in a letter of the imperial chancellor Conrad of Querfurt (1947).

"The Irish bishop to Carinthia, St Virgilius, bishop of Salzburg (d. 784), who held original views on the subject of antipoises, may have been the real eponym of the legend."
It was at Henry VII's instance that he commenced his *Historia Anglica*—a work which, though seemingly begun as early as 1505, was not completed till August 1533, the date of its dedication to Henry VIII., nor published till 1534. In May 1514 he and his patron the cardinal are found supporting Wolsey's claims to the cardinalship, but he had lost the great minister's favour before the year was out. A rash letter, reflecting 'severely on Henry VIII. and Wolsey,' was intercepted early in 1515. Wolsey, Polydore says, not only returned to London in March (and April). He was not without some powerful supporters, as both Catherine de' Medici and Leo X. wrote to the king on his behalf. From his prison he sent an abject and almost blasphemous letter to the offended minister, begging that the fast approaching Christmas—a time which witnessed the restitution of a world—might see his pardon also. He was set at liberty before Christmas 1515, though he never regained his collectorship. In 1525 he published the first edition of *Gildas*, dedicating the work to the Emperor of London. Next year appeared his *Libre de Prodigiis*, dedicated (July) to the marriage of Maria, duke of Urbino. Somewhere about 1538 he left England, and remained in Italy for some time. Ill-health, he tells us, forbade him on his return to continue his custom of making daily notes on contemporary events. About the end of 1551 he went home to Urbino, where he appears to have died in 1555. He had been naturalized an Englishman in October 1510, and had held several clerical appointments in England. In 1558 he was appointed archdeacon of Wells, and in 1573 prebendary of Oyston in St. Paul's cathedral, both of which offices would add to his comfort.

The first edition of the *Historia Anglica* (twenty-six books) was printed at Basel in 1534; the twenty-seventh book, dealing with the reign of Henry VIII. down to the birth of Edward VI. (October 1536), was added to the third edition of 1555. Polydore claims to have been very careful in collecting materials for this work, and takes credit for using foreign historians as well as English; for which reason, he remarks, the English, Scotch and French will find several things reported in his pages far differently from the way in which they are as a matter of course for the story of his search for information he applied to James IV. of Scotland for a list of the Scottish kings and their annals; but not even his friendship for Galloway made him capable of the notions of this accomplished bishop, who traced the pedigree of the Scots down from the banished son of an Athenian king and Scotta the daughter of the Egyptian tyrant of the Israelites. A similar search for the story of the Virgin Mary of Urbino, and thus called forth Landal's *Defensive Galliardis et Assertio Incomparabili Astari*. This doubting instinct led to his being accused of many offences against learning, such as that of burning cargoes of MSS. lest his errors should be discovered, of purloining books from libraries and shipping them off by the vesselful to Rome. As a matter of fact, it is of course mainly from the time of Henry VI., where our contemporary records begin to fall so sadly, that Polydore's work is useful. He must have been personally acquainted with many men whose memories could carry them back to the beginning of the Wars of the Roses. Dr. Brewer speaks somewhat harshly of the book as a work of Henry VII., and indeed his spite against Wolsey is evident; but it is impossible to read his social and geographical accounts of England and Scotland without interest, and his general description of Polydore's *Adagia* (Venice, 1498) was the first collection of Latin proverbs ever printed; it preceded Erasmus's by two years, and the slight misunderstanding that arose for the moment out of rial claims gave place to a sincere friendship. A second series of Biblical proverbs (553 in number) was dedicated to Wolsey's follower, Richard Pace, and is preceded by an interesting letter of 1510, which gives the names of many of Polydore's English friends and acquaintances, notably Richard Sandys and Tunstall. The *De Inventoribus*, treating of the origin of all things whether ecclesiastical or lay (Paris, 1499), originally consisted of only seven books, but was increased to twelve before it was exceedingly popular, and was early translated into French (1521), German (1537), English (1546) and Spanish (1551). All editions, however, except those following the text sanctioned by Gregory XIII. in 1576, are on the Index Expurgatorius. The *De Prodigis* also achieved a great popularity, and was soon translated into Italian (1543), English (1546) and Spanish (1550). This treatise takes the form of a Latin dialogue between Polydore and his Cambridge friend Robert Ridley. It takes place in the garden at Polydore's country house near London. Polydore's duty is to state the problems and supply the historical illustrations; his friend's to explain, rationalize and depreciate as best he can. Here, as in the *Historia Anglica*, it is plain that the writer places himself specially on the excellence of his Latin, which in Sir Henry Ellis's opinion is purer than that of any of his contemporaries.

**VIRGINAL—VIRGINIA**

The mechanism is described under Pianoforte and Spinet.
tributary previous to the depression which transformed them into bays. The land between the drowned valleys is relatively flat, and varies in height from sea-level on the E. to 150-300 ft. on the W. The most extensive and best-known drowned valley is the Chesapeake Bay, a part of the extensive Piedmont Belt reaching from Pennsylvania to Alabama. This is the most extensive of the subdivisions of Virginia, comprising 18,000 sq. m. of land. It is a coastal lowland on folded flanks of sandstone, lime and shale comprising an area of about 10,400 sq. m. in Virginia. The belts of non-resistant rock have been worn away, leaving longitudinal valleys, cut by old rock streams, which are in part filled with sediments in which weak rocks predominate give an unusually broad valley region, known as the Valley of Virginia, drained by the Shenandoah river, and the headwaters of the James, Roanoke, New, and Holston rivers. Along the upper reaches of these streams are a number of low and broad valleys which are separated by hills. At the N., near the mouth of the Shenandoah, the valley is about 250 ft. above sea-level, but rises south-westward to an elevation of more than 1600 ft. at the S. boundary of the state. Along the N.W. to S.E., across the Blue Ridge, the Piedmont and the Coastal Plain, following courses which were established before erosion had produced much of the present topography. But in the New Appalachians the streams more often follow the trend of the structure until they empty into one of the larger, transverse streams. Thus the Shenandoah flows N.E. to the Potomac, the Holston S.W. toward the Tennessee. The situation is different in this same area to the east of the state, is drained by the New river, which flows N.W. across the ridges to the Kanawha and Ohio rivers in the Appalachian Plateau. In the limestone regions caverns and natural bridges occur, among which Luray Cavern and the Natural Bridge are well known. The drowned lower courses of the S.E. flowing streams are navigable, and afford many excellent harbours. Chesapeake Bay covers much land that might otherwise be agriculturally valuable, but repays this loss, in part at least, by its excellent fisheries, including those for oysters. In the S.E., where the low, flat Coastal Plain is poorly drained, is the Great Dismal Swamp, a fresh-water marsh covering 70,000 acres, an area of which is about 50 ft. below sea level. The higher parts stand more than 3 ft. above sea level, the lower parts are covered by a dense growth of rank vegetation. The region is of much value, as a valuable agricultural area which is still available for settlement.

The Atlantic right-whale was killed in some numbers off the coast. Many species of water and shore birds migrate along the coast, wintering in the region, as well as the great cormorant, the white pelican and black skimmer; practically all the ducks are migrant species, though the wood-duck breeds. Swan, goose and brant winter on the coast. The yellow-footed gull is common, and the little blue heron nests rarely. The turkey-buzzard and the barn-owl, the red-shouldered hawk and the short-eared owl are common, and the snowy owl has been seen in the interior. The red-headed and red-bellied woodpeckers, orchard orioles, yellow-winged sparrows, the cardinal, the blue grosbeak, the Carolina wren, and the black-billed cuckoo are far more common in the Piedmont region. The ruffed grouse and wild turkey are found in the wooded mountain districts, while the quail (here called "partridge") is a game bird of the open stable fields. Of the game, the raccoon and copperhead are the only poisonous species, but numerous harmless varieties are common. In the salt marshes of the coast occurs the diamond-backed terrapin. Three of the most attractive of the Virginia snakes are the black racer, the hog-nosed snake, and the enhydris of the interior. The cat-fish grows to a large size in the sluggish rivers. On the coast, the striped bass, sea-bass, drum, sheepshead, weakfish, bluefish and Spanish mackerel are important food fishes. There are valuable oyster fisheries in Chesapeake Bay.

Flora.—The Coastal Plain of Virginia is covered with pine forests which merge westward with the hard woods of the Piedmont Belt, where oaks formerly prevailed, but where a second growth of pine now constitutes part of the forest. Even on the Coastal Plain the southern and tropical species are represented by species which are characteristic of the original growth. The Blue Ridge and Newer Appalachian regions are covered with pine, hemlock, white oak, cherry and yellow poplar; while that portion of these provinces lying in the S.W. and the Tidewater consists of pine on the coast, oak, hickory, walnut, besides oak and cherry. On the Coastal Plain the cypress grows in the Dismal Swamp, river birch along the streams, and sweet gum and black gum in swampy woods. Other characteristic plants of the Coastal Plain are the cranberry, wild rice, wild yam, wax myrtle, wistaria, trumpet flower, passion flower, holly and white alder. Many of these species spread into the Piedmont Belt, and such and the Blue Ridge. In the mountains, the blackberry, blueberry, wild ginger and gingko are widely distributed.

The winter temperatures are generally far from extremes of heat and cold. In the Coastal Plain the mean temperature is quite stable from day to day, as a result of the equalizing effect of the numerous bays which indent this province. The mean winter temperature is 45°, with a mean annual of 58.6°. Killing frosts do not occur before the middle of October, nor later than the last part of April. In the Piedmont Province temperature conditions are naturally less stable, and the influence of the mountains is less marked. The local inequality of surface topography. In autumn and winter sudden temperature changes are experienced, though not frequently. The mean winter temperature for the state is 35°, with a mean annual of 57°. Mean temperatures in the northern coastal counties are about 2° higher, in the southern counties about 2° lower.

In the mountain districts the winters are very severe. The mean winter temperature for the state is 33.8°, with a mean annual of 57.3°. Mean temperatures in the northern coastal counties are about 2° higher, in the southern counties about 2° lower.

The forest area of Virginia was estimated in 1900 at 23,400 sq. m., or 55% of the area of the state. The timber area originally comprised three divisions: the mountain regions growing pine and hard woods and hemlock; the Piedmont region producing chiefly oaks with some pine; and the sands below the "Fall Line", where the forest was forested with yellow pine. Most of the pine of the Piedmont region was cut in the latter part of the nineteenth century, and the high and rugged Blue Ridge, which is fertile except in the intervening valleys of its S.W. expansion, we reach the Newer Appalachians, where fertile limestone soils cover the valley floors. The Virginia of 1900 is the most productive part of the state.

Fishes.—There are numerous fish species in the rivers and streams, and many in the Chesapeake Bay. The most valuable of these is the striped bass, which is abundant in the bay and along the coast.

The production of production of tobacco in 1899 was 34,561,000 pounds, valued at $34,561,000; of wheat, 8,848,000 bushels, valued at $10,185,000; of oats, 3,800,000 bushels, valued at $2,082,000; of corn, 3,500,000 bushels, valued at $1,005,000; of potatoes, 3,000,000 bushels, valued at $187,000; hay crop was valued at $187,000; the hay crop was valued at $8,660,000 (600,000 tons). The amount of the wheat crop in 1900 was 13,179,000 bushels.

The value of horses in 1900 was $5,165,000 (333,000 head); of mules, $7,026,000 (54,000 head); of cattle, $20,034,000 (757,000 head); of swine, $5,034,000 (774,000 head); of sheep, $2,705,000 (13,000,000 head).

Minerals.—The value of all mineral products in 1908 was $13,179,339. By far the most valuable single product was bituminous coal ($1,868,824; 4,259,424 tons). The existence of this mine at the mouth of the James River was known as early as 1770, and the mining of it there began in 1775, but it was practically
discontinued about the middle of the 19th century. The most important coalfields of the state lie in the Appalachian regions in the S.W. part of the state, though there are also rich deposits in the counties of Henrico, Chesterfield, and Richmond, and in parts of Prince George, Fauquier, and Rappahannock counties. The average output of coal has increased since the opening of the Potomac and Rappahannock navigation (1815). The area of the mines in 1890 was about 3,552,000 acres, and the average depth was 450 feet. The average output of coal in 1890 was 23,031,200 tons.

Iron mines. — Virginia has a number of iron mines, of which the most important is that of the James River, in the county of Rockingham. The iron is of the hematitic kind, and is worked by the James River Iron and Steel Company, which is one of the largest in the state. The output of iron in 1890 was 3,000,000 tons.

Copper mining. — Copper is mined in the counties of Giles, Alleghany, and Botetourt. The output in 1890 was 1,200,000 pounds.

Platinum. — Platinum is mined in the county of Rockingham.

Gold mining. — Gold is mined in the counties of Montgomery, Augusta, and Botetourt. The output in 1890 was 1,000,000 pounds.

Silver mining. — Silver is mined in the counties of Montgomery, Augusta, and Botetourt. The output in 1890 was 500,000 pounds.

Sulfur mining. — Sulfur is mined in the counties of Augusta and Botetourt. The output in 1890 was 500,000 pounds.

Bituminous coal. — Bituminous coal is mined in the counties of Giles, Alleghany, and Botetourt. The output in 1890 was 1,000,000 tons.

Number of wage-earners. — The number of wage-earners in 1890 was 4,000,000.

Value of products. — The value of products in 1890 was $148,856,525.

Transportation and Commerce. — Four large railway systems practically originate in the state and radiate to the S. and W.: the Southern railway, with its main line traversing the state from the central to the western counties; the Virginian, which passes through Alexandria, Charlottesville, Lynchburg and Danville to the North Carolina line, with connections to Richmond and a line to Norfolk; the Atlanta Coast line, with its main line running S. from Richmond and Norfolk; the Seaboard Air Line, having its main lines also running to the S. from Richmond and Norfolk; the Norfolk & Western crossing the state from east to west in the southern part of the state and Norfolk its eastern terminus, passing through Lynchburg and leaving the state at the southwestern corner at Bristol, and the Chesapeake & Ohio crossing the state from east to west north of the Norfolk & Western.

The total number of miles of railway in the state in 1890 was 2,000,000. The total number of miles of railways in the United States in 1890 was 3,600,000.

Value of products. — The value of products in 1890 was $148,856,525.

Number of wage-earners. — The number of wage-earners in 1890 was 4,000,000.

Value of products. — The value of products in 1890 was $148,856,525.
VIRGINIA

Germans, 3,534 were natives of Ireland and 3,425 of England. Of the total population 32,264 were of foreign parentage (i.e. other than both parents). The native parents were 9,283 of Irish and 4,792 of English parentage, both on the father's and on the mother's side. Out of the total of 793,566 members of religious denominations in 1906, more than half, 415,987, were Baptists, 117,040 Methodists, 65,340 of both branches, 30,000 Presbyterians, 28,700 Roman Catholics, and 28,872 Protestant Episcopalians, 26,248 Disciples of Christ, and 12,010 Lutherans.

Voter registration was increased in 1904 and 46,000 in 1906. The principal cities of the state are: Richmond (the capital), Norfolk, Petersburg, Roanoke, Newport News, Lynchburg, Portsmouth and Danville.

Government.—Virginia has had six state constitutions: the first was adopted in 1776, the second in 1820, the third in 1851, the fourth in 1864, the fifth in 1860, and the sixth, the present, in 1902. Amendments to the present constitution may be proposed in either house of the General Assembly, and if they pass both houses of that and the succeeding General Assembly by a majority of the members elected to each house and are subsequently approved by a majority of the people who vote on the question at the next general election they become a part of the constitution. A majority of the members in each house of the General Assembly may at any time propose a convention to revise the constitution, and if at the next succeeding election a majority of the people voting on the question approve, the General Assembly must provide for the election of delegates. To be entitled to vote one must be a male citizen of the United States and twenty-one years of age; have resided at least fifteen years from the time of his election, city, or town, for one year, and of the election precinct from thirty days next preceding the election; have paid, at least six months before the election, all state poll taxes assessed against him for three years next preceding the election, unless he is a veteran of the Civil War; and have registered after the adoption of the constitution (1902). For registration prior to 1904 one of four additional qualifications was required: service in the army or navy of the United States, of the Confederate States, or of some state of the United States or of the Confederate States; direct descent from one who so served; ownership of property upon which state taxes amounting to at least one dollar were paid in the preceding year; or ability to read the constitution or to show an understanding of it. And to qualify for registration after 1904 one must have paid all state poll taxes assessed against him for the three years immediately preceding his application, unless he is a veteran of the Civil War; and unless physically unable he must "make application in his own handwriting, without aid, suggestion or memorandum, in the presence of the registrar of voters, stating therein his name, age, date and place of birth, residence and the time of his election from thirty days next preceding, whether he has previously voted, and, if so, the state, county and precinct in which he voted last."

Executive.—The governor, lieutenant-governor, attorney-general, secretary of the commonwealth, treasurer, superintendent of public instruction and commissioner of agriculture are elected for a term of four years, every fourth year from 1902, and each new administration may require a reorganization of the general government. The governor must be at least thirty years of age, a resident of the state for five years next preceding his election; and, if of foreign birth, a citizen of the United States for at least ten years. He appoints all officers of the state except the lieutenant-governor; he must, however, report to the General Assembly at its next session the cause of any suspension and the assembly determines whether the suspended officer shall be restored or removed.

Legislature.—The General Assembly consists of a Senate and a House of Delegates. The Constitution provides that the number of senators shall be not more than forty nor less than thirty, and that the number of delegates shall not be more than one hundred nor less than ninety. Senators and delegates are elected by single districts. Each county in the state is apportioned once every ten years, according to population, the senators for a term of four years, the delegates for a term of two years. The only qualifications for senators and delegates are those required of an elector and residence in their districts; there are, however, a few disqualifications, such as being a voter of a commission, or having committed the state to certain obligations.

The General Assembly meets regularly at Richmond on the second Wednesday in January of each even-numbered year, and the governor must call an extra session on the application of two-thirds of the senators or a like number of the representatives. The General Assembly may at any time provide for the appointment of a fiscal committee, and in cases of impeachment, to try the governor if the Senate shall discharge him for the duration of the remainder of his term. The number of regular sessions is limited to sixty days unless three-fifths of the members of each house are present. In the first sixty days, the General Assembly may appropriate bills, and to overcome his veto, whether of a whole bill or an item of an appropriation bill, a two-thirds vote in each house of the members present is required, and such two-thirds must include in each house a majority of the members elected before 1892. Whenever the governor approves of the general purpose of a bill, but disapproves of some provision or portions, he may return the bill with his recommendations for amendment, and when it comes back he may, whether his recommendations have been adopted or not, treat it as if it were before him for the first time.

Judiciary.—The administration of justice is vested principally in a supreme court of appeals, circuit courts, city courts and courts of record. The supreme court consists of five judges, but any three of them may hold a court. They are chosen for a term of twelve years by a joint vote of the Senate and the House of Delegates. The court sits at Richmond, Staunton, Alexandria, and Louisville. The court is necessary to the decision of a case involving the constitutionality of a law. Whenever the docket of this court is crowded, or there is a case upon which the state is seriously interested, an important statute, or an act of General Assembly may provide for a special court of appeals, to be composed of not more than five nor less than three judges of the circuit courts and city courts, in cities having a population of 16,000 or more. The judge is elected into a third judicial circuit and, in each of these, a circuit judge is chosen for a term of eight years by a joint vote of the Senate and the House of Delegates. The jurisdiction of the circuit court was extended by the present Constitution to include the election of county sheriffs and coroners, and in cases of complexity the circuit judge is elected by a joint vote of the Senate and the House of Delegates for a term of four years.

Local Government.—Each county is divided into magisterial districts, varying in number and extent according to the size of the county. Each district elects a supervisor for a term of four years, and the district supervisors constitute a county board of supervisors, which represents the county as a corporation, manages the county property and county business, levies the county taxes, audits the accounts of the county, and recommends for appointment by the circuit court a county surveyor and a county superintendent of the poor. Each county also elects a treasurer, a sheriff, an attorney and one or more commissioners. The sheriff, who is clerk of the circuit court, for a term of eight years. The coroner is appointed by the circuit court for a term of two years. Each magisterial district elects, besides a supervisor and justices of the peace, a constable and an overseer of the poor, each for a term of four years. The Constitution provides that all "communities" with a population less than 5,000, incorporated after its adoption, or having been recently incorporated, in the city, which the city may incorporate after its adoption, the Constitution requires the election in each of a mayor, a treasurer and a sergeant-at-arms, and the election of a commissioner of the revenue for an equal term; that in cities having a population of 10,000 or more the council shall be composed of two branches; that the mayor shall be elected by the council for a term of four years, and that the council may prescribe by ordinance or resolutions, which can be overridden only by an affirmative vote of the members elected to each branch, and that no city shall incur a bonded indebtedness exceeding the assessed value of its real estate.

Miscellaneous Laws.—A married woman may manage her separate
property as if she were single, except that she cannot by her sole will deprive her husband of his courtesy in her real estate. A widow is entitled to a dower in one-third of the real estate of which her husband was seized at any time during coverture. If the husband dies intestate, the surviving spouse, if married to him at least five years, is entitled to an inheritance of one-fourth of all the property during his lifetime if she is entitled to so much of his personal estate as was acquired by him by virtue of his marriage with her prior to the 4th of April 1877; if he leaves no surviving spouse, the widow is entitled to an inheritance of one-half of all the property during his lifetime. A widow is entitled by courtesy to a life interest in all her late husband's real estate; if she dies intestate, she is entitled to all her late husband's personal estate. The causes for an absolute divorce are adultery; impotency; desertion for three years; a sentence to confinement in the penitentiary; a conviction of an infamous crime. The law is unknown to the other; or, if one of the parties is charged with an offence punishable with death or confinement in the penitentiary, and has been a fugitive from justice for two years; pregnancy of the wife before marriage unknown to the husband, or the wife's being a prostitute before marriage unknown to the husband. One party must be a resident of the state for one year preceding the commencement of a suit for a divorce. When a divorce is obtained before the death of the husband, and applicable to a minor child who is in the discretion of the court. Marriages between whites and negroes and bigamous marriages are void. The homestead of a husband is exempt as a circuit court sale, but is not exempt as a property of a public officer. If the owner is a married man his homestead cannot be sold except by the joint deed of himself and his wife; neither can it be mortgaged without his wife's consent except for purchase money or for the erection or repair of buildings upon it.

The exemption continues after his death so long as there is an unmarried widow or an unmarried minor child. The family library, family pictures, school books, a seat or pew in a house of public worship, a lot in a burial ground, necessary wearing apparel, a limited amount of furniture and household utensils, some of a farmer's domestic animals and agricultural implements, and the wages of a labouring man in the hands of his master, the proceeds of a professional man's earnings in the hands of his employer, any property not exceeding $1000 as recorded in 1808 forbids the employment of children under fourteen years of age in any factory, workshop, mercantile establishment, or mine within the state, except that orphans or children dependent upon their own labour for support or upon whom invalid parents are dependent may be so employed after they are twelve years of age, and that a parent may work his or her own children in his or her family farm or workshop.

Charitable and Penal Institutions.—Virginia has four hospitals for the insane: the Eastern State Hospital (1773), at Williamsburg; the South-Western State Hospital (1857), at Marion; the Western State Hospital (1856), at Broadnax, and the Central State Hospital (1851), at Petersburg. For the care of the deaf and blind there is the Virginia School for the Deaf and Blind (1842) at Richmond. The Virginia School for Coloured Deaf and Blind Children (1908), at Newport News. The State Penitentiary is at Richmond. The Prison Association of Virginia with an Industrial School (1890) at Laurel Station, the Negro Reformatory Association of Virginia with a Manual Labour School (1897) at Broadnax, Hanover, and the Virginia Home and Industrial School for white girls (1910) at Bon Air take care of juvenile offenders; these are all owned and controlled by self-perpetuating boards of trustees, but are supported by the state, receiving an allowance per capita. For each state hospital for the insane there is a special board of directors consisting of five prominent citizens, appointed by the governor of the state; the superintendent of the state, one every two years, and over them all is the commissioner of state hospitals for the insane, who is appointed by the governor with the concurrence of the Senate for a term of four years. The board and the superintendent of the insane hospital are directly elected by the people for a term of four years, and are renewable. The commissioner is ex-officio superintendent of the insane and the commissioner also has the power to make the Executive Secretary of the state; and the superintendent of every hospital is appointed by the general assembly, and he is also the executive secretary of the state; and the board of visitors appointed by the governor with the concurrence of the Senate. About five-sixths of the convicts are negroes. Some of them are employed on a state farm at Lassiter, Goochland county, one of the largest Negro farms in the state. The Asylum for the Blind is at Richmond, and the Asylum for the Deaf and Dumb at Williamsburg. Public and private roads; in 1909 there were 350 men at the state farm, 14 road camps with about 630 men, and 1273 men and 96 women in the penitentiary at Richmond. When a prisoner has served one-half of his sentence or the board of visitors, if he has been confined for that period the board of directors may parole him for the remainder of his term, provided there is satisfactory assurance that he will not be dependent on public charity. The Prison Association of Virginia, the Negro Reformatory Association of Virginia and the Virginia Home and Industrial School for girls are each under a board of trustees appointed by the General Assembly, and each is authorized to establish houses of correction, reformatory and industrial schools. A general supervision of all the juvenile and private charitable institutions is exercised by a board of visitors appointed by the general assembly; the major portion of its proceedings are annual; the remaining portion of its proceedings are biennial; the superintendents of public instruction, who is ex officio, its president; three experienced educators chosen quadrennially by the Senate from members of the faculties of the University of Virginia, Hampden-Sidney College, Washington and Lee University, Randolph-Macon College, the Institute, the Female Normal School at Farmville, the School for the Deaf and Blind, and the College of William and Mary; and a division superintendent, appointed by the governor with the concurrence of the Senate, for each county. Each county is chosen biennially by the other members of the board. This board prescribes the duties of the superintendent of public instruction and decides appeals from his decisions; keeps the state divided into school divisions, consisting not less than one half of one county or city each; appoints quadrennially, with the concurrence of the Senate, one superintendent for each school division and prescribes his powers and duties; selects textbooks; provides for examination and certification of teachers, and assigns teachers to the schools, and the board, consisting of the attorney for the Commonwealth, the division superintendent and one member appointed by the governor, is authorized to make rules and regulations for the schools for each district, one each year. The division superintendent and the school trustees of the several districts constitute a county school board.

The elementary schools are maintained from the state endowment fund, the state tax fund, the city and county tax fund, the county commissioners' fund, and the state educational fund, besides the federal educational fund, a portion of the state poll tax, a property tax not less than one mill nor more than five mills on the dollar, and special appropriations; county funds, consisting principally of a property tax; and certain taxes, consisting principally of a property tax and a dog tax. A law enacted in 1908 encourages the establishment of schools of agriculture, economic science and business, and elementary normal schools, and older schools of agriculture and economic science are divided. A law enacted in 1910 provides a fund for special aid from the state to rural graded schools with at least two rooms. With state aid normal training departments are maintained in several of the state normal schools. The state normal school at Farmville, which is divided into several sections, one of which is the women's department. The state normal school at Salem, founded in 1877 and opened in 1889, is the College of William and Mary, which was established in 1693. The University of Virginia at Charlottesville, opened in 1819, is the first state supported university in the nation, and the Commonwealth of Virginia, the Constitution of 1829, and the act of 1862, provides for the support of the University of Virginia. The University of Virginia, at Charlottesville, opened in 1819, is the first state supported university in the nation, and the Commonwealth of Virginia, the Constitution of 1829, and the act of 1862, provides for the support of the University of Virginia.
deeds, seals, lawsuits, banks, trust and security companies, insurance companies, express companies, railway and canal corporations, sleeping-car, parlour-car and dining-car companies, telegraph and telephone companies. In the 18th and 19th centuries, the income and receipts from such businesses were large and the revenue is collected by county and city treasurers, clerks of courts, and the state corporation commission, consisting of three members appointed by the governor with the concurrence of the General Assembly. The total amount collected in 1989-1990 amounted to $5,536,510 and the total disbursements to $5,796,980. By the 1st of January 1861 Virginia had incurred a debt amounting to nearly $50,000,000. The General Assembly passed an act at that time for redeeming two-thirds of it, claiming that the other third should be paid by West Virginia. But the advocates of a 'forcible readjustment' of the debt carried the election in 1879 with the aid of the negro vote, and after prolonged negotiations in 1892 a settlement was effected under which a debt amounting to about $28,000,000 was again refunded. In 1908 this had been reduced to about $24,000,000. The sinking fund consists of interest recovery against defaulting revenue collectors, railway stock and appropriations from time to time by the legislature.

History.—Virginia was the first permanent English settlement in North America. From 1583 to 1588 attempts had been made by Sir Walter Raleigh and others to establish colonies on the coast of what is now North Carolina. The only result was the naming of the country Virginia in honour of Queen Elizabeth. But glowing accounts were brought back by the early adventurers, and in 1606 an expedition was sent out by the London Company, which was chartered with rights of trade and settlement in Virginia. It was not until 1619 that a settlement was made, at a place which was called Jamestown, on the 13th of May, and resulting in the establishment of many plantations along the James river. The purpose of the company was to build up a profitable commercial and agricultural community; but the hostility of the natives, unfavourable climatic conditions and the character of the colonists delayed the growth of the new community. John Smith became the head of the government in September 1608, compelled the colonists to submit to law and order, built a church and prepared for more extensive agricultural and fishing operations. In 1609 the London Company was reorganized, other colonists were sent out, and the boundaries of the new country were fixed, according to which Virginia was to extend from a point 200 m. south of Old Point Comfort, at the mouth of Chesapeake Bay, to another point 200 m. north, "west and northwest to the South Sea."

The government of the country was in the hands of the London Company, which in turn committed administrative and local affairs to a governor and council who were to reside in the colony. Before the arrival of the "government" and their shiploads of settlers the original colony was reduced to the direst straits. Captain Christopher Newport (d. 1618), Sir Thomas Gates and Sir George Somers, the new authorities, reached Jamestown at last in 1565, but finding things in such a deplorable state all agreed (June 10, 1610) to give up the effort to found a colony on the James and set sail for Newfound-land. At the mouth of the river they met Lord Delaware, however, who brought other colonists and plentiful supplies; and they returned, set up a trading post at what is now Hampton and undertook to bring the hostile natives to subjection. In 1611, 650 additional colonists landed, the James and Appomattox rivers were explored and plantations" were established at Henrico and New Kent counties. In 1617 Virginia fell into the hands of a rigid Puritan, Captain Samuel Argall. The colonists were compelled on pain of death to accept the doctrine of the trinity, respect the authority of the Bible and attend church. This rigid regime was superseded in 1619 by a milder system under Sir George Yeardley (d. 1627). Twelve hundred new colonists arrived in 1619. At the same time negro slaves and many "indentured" servants were imported as labourers. At the beginning Virginia colonists had held their land and improvements in common. But in 1616 the land was parcelled out and the settlers were scattered along the shores of the James and Appomattox rivers many miles inland. Twenty thousand pounds of tobacco were exported in 1619. The community had now become self-supporting, and the year that witnessed these changes witnessed also the first representative assembly in North America, the Virginia House of Burgesses, a meeting of planters sent from the plantations to assist the governor in reforming and making the laws of the colony. In 1621 a constitution was granted whereby the London Company and the colonists were to share in the government. The planters were to elect two members for every 10,000 and occupying counties, whereas the burgesses and plantations delegates to the House of Burgesses. The popular assembly, like the English House of Commons, granted supplies and originated laws, and the governor and Council enjoyed the right of revision and veto as did the king and the House of Lords at home. The Council sat also as a supreme court to review the county courts. This system remained unchanged until the revolution of 1776. But in 1624 the king took the place and exercised the authority of the London Company.

Before 1622 there was a population of more than 4000 in Virginia, and the many tribes of Indians who were still the proprietors of the soil over a greater portion of the country naturally became jealous, and on the 22nd of March of that year fell upon the whites and slew 350 persons. Sickness and famine once again visited the colony, and the population was reduced by nearly one-half. These losses were repaired, however; the tobacco industry grew in importance, and the settlers built their cabins far in the interior of lowland Virginia. This rapid growth was scarcely retarded by a second Indian attack, in April 1621, which resulted in the death of about 350 settlers. Between the years 1619 and 1641 the population of Virginia was more than doubled.

Virginia was neither a cavalier nor roundhead, but both. Sir William Berkeley had been the governor since 1641, and though he was loyal enough to the crown, it was without difficulty that his authority was overthrown in March 1652 and that of Cromwell proclaimed in its stead. Richard Bennett, a Puritan from Maryland, now ruled the province. Bennett and his Puritan successors, Edward Digges and Samuel Mathews, made no serious change in the administration of the colony except to extend greatly the elective franchise. But this policy was reversed in 1660, when Berkeley was restored to power. The return of Berkeley was the beginning of a reaction which concentrated authority, both in the House of Burgesses and in the Council, in the hands of the older families, and thus created a privileged class. The governor, supported by the great families, retained the same House of Burgesses for sixteen years lest a new one might not be submissive. The increasing mass of the population dwelt along the western border or on the less fertile ridges which make up the major part of the land even in tide-water Virginia. These poorer people—who were not, however, "poor whites"—developed an abiding hostility towards the oligarchy. They desired a freer land-grant system, protection against the inroads of the Indians along the border, and frequent sessions of an assembly to be chosen by all the freeholders. But a new code of laws outlawed many of these people as dissenters, and in 1676 a burdensome tax was laid by the representative assembly. The Indians had again attacked the border farmers, and the governor had refused assistance, being willing, it was generally believed, that the border population should suffer while he and his adherents enjoyed a lucrative fur trade with the Indians. Under these circumstances, Nathaniel Bacon (1641-1676), whose grandfather was a cousin of Francis Bacon, too up the cause of the poor whites and severely punished the Indians at the battle of Bloody Run. But Berkeley meanwhile had outlawed Bacon, whose forces now marched on the capital demanding recognition as the authorized army of defence. This was refused, and civil war began, in which the governor was defeated and Jamestown was burned. But Bacon fell a victim to malaria and died in October in Gloucester county. Berkeley closed the conflict with wholesale executions and confiscations. Censured by the king, he sailed to England to make his defence, but died in London in 1677 without having seen Charles. Virginia
remained in the hands of the reactionary party and was governed by men whose primary purpose was to "make their fortunes" at the expense of the colonials. Even the accession of William and Mary scarcely affected the fortunes of the "fifth kingdom," though Middle Plantation, a hamlet not far from Jamestown, became Williamsburg and the capital of the province in 1691, and the clergy received a head, though not a bishop, in the person of James Blair (1663-1743), an able Scottish churchman, who as commissary of the bishop of London became a counterpoise to the arbitrary governors, and who as founder and head of the College of William and Mary (established at Williamsburg in 1693) did valiant service for Virginia. Under the stimulus of the Virginia Act of 1716, the whole body of the clergy, consisting of all the non-presbyterians, was enrolled in the Virginia Corporation, in which they had "an equal voice and part," and the ministers and tobacco-growers settled along the upper Rappahannock, and, uniting with the borderers in general, they offered strong resistance to the older planters on the James and the York.

Tobacco-growing was the one vocation of Virginia, and many of the planters were able to spend their winters in London or Glasgow and to send their sons and daughters to the finishing schools of the mother country. Negro slavery grew so rapidly during the first half of the eighteenth century that the blacks outnumbered the whites in 1740. The master of slaves set the fashion. Handsome houses were built along the banks of the Virginia rivers, and numerous slaves were employed. There was as great a social distance between the planters and their families on the one side and the masses of people in Virginia on the other as that which separated the nobles from the yeomen in Europe; and there was still another chasm between the small farmers and the negroes.

In 1716 an expedition of Governor Alexander Spotswood over the mountains advertised to the world the rich backcountry, now known as the Valley of Virginia; a migration thither from Pennsylvania and from Europe followed which resulted in the formation of the Western counties of Virginia. The colonization of the Commonwealth for the most part was completed by 1740, when the new counties were organized. The counties were sufficiently independent of the old counties, and the western counties did not work in concert with the old counties, but the old counties would not cooperate with them. The old counties were in a position to refuse to do what the new counties would do, and the new counties would not do what the old counties would do; and yet both sought to carry on the war against the Cherokee and the Chickasaw. The counties were independent of one another, and the Old State and the New State were independent of each other.

In 1716 the legislature of Virginia passed an act for the support of a university. The act provided for a governing body to be elected by the House of Burgesses. The body was to consist of the governor, the Lieut. Governor, and four county lieutenants; but it was soon changed to consist of the governor, the Lieut. Governor, and the four county lieutenants, and the names of the other two members were to be ordered by the House of Burgesses. The act was an act of self-interest, and the act of self-interest of the House of Burgesses was to be the official act of the government. The act was a step forward, and the act of self-interest of the House of Burgesses was to be the official act of the government. The act was an act of self-interest, and the act of self-interest of the House of Burgesses was to be the official act of the government.
VIRGINIA

formation of a national government with adequate powers to supersede the lame confederacy. In 1787, under the presidency of Washington, the National Convention sat in Philadelphia, with the result that the present Federal Constitution was submitted to the states for ratification during 1787-1789. In Virginia the tide-water leaders urged adoption, while the up-country men, following Henry, opposed; but after a long and bitter struggle, in the summer of 1788 the new instrument was accepted, the low-country winning by a majority of ten votes, partly through the influence of James Madison. Thus the eastern men, who had reluctantly supported the War of Independence, now became the sponsors for the national government, and Washington was compelled to rely on the party of slavery, not only in Virginia but in the whole South, in order to administer the affairs of the nation.

In 1784, Virginia, after some hesitation, ceded to the Federal government the north-west territory, which it held under the charter of 1609; in 1792 another large strip of the territory of Virginia became an independent state under the name of Kentucky. But the people of these sessions, especially of Kentucky, were closely allied to the great up-country party of Virginia, and altogether they formed the basis of the Jeffersonian democracy, which from 1794 opposed the chief measures of the Washington administration, and which on the passage of the Alien and Sedition laws in 1798 precipitated the first great constitutional crisis in Federal politics by the adoption in the Kentucky and Virginia legislatures of the resolutions, known by the names of those states, strongly asserting the right and duty of Congress to arrest the course of the national government whenever in their opinions that course had become unconstitutional. Jefferson was the author of the Kentucky resolutions, and his friend Madison prepared those passed by the Virginia Assembly. But these leaders restrained their followers sharply whenever the suggestion of secession was made, and the question of what was meant by arresting the course of Federal legislation was left in doubt. The election of 1800 rendered unnecessary all further agitation by putting Jefferson in the President's chair. The up-country party in Virginia, with their allies along the frontiers of the other states, was in power, and the radical of 1776 shaped the policy of the nation during the next twenty-five years. Virginia held the position of leadership in Congress, controlled the cabinet and supplied many justices of the Supreme Court.

Virginia played a leading rôle in the War of 1812, and up to 1835 her influence in the new Western and North-Western states was overwhelming. But the steady growth of slavery in the East and of a virile democracy in the West neutralized this influence and compelled the assembling of the constitutional convention of 1839, whose purpose it was to redress the fundamental law in such a way as to give the more populous counties of the West their legitimate weight in the legislature. The result was failure, for the democracy of small farmers which would have taxed slavery out of existence was denied proportionate representation. The slave insurrection under Nat Turner (q.v.) in 1831 led to a second abortive effort, this time by the legislature, to do away with the fateful institution. The failure of these popular movements led to a sharp reaction in Virginia, as in the whole South, in favour of slavery. From 1835 to 1860 many leading Virginians defended slavery as a blessing and as part of a divinely established order.

In 1850 a third Convention undertook to amend the Constitution, and now that the West yielded its bitter hostility to slavery, representation was so arranged that the more populous section was enabled to control the House while the East still held the Senate; the election of judges was confided to the people; and the suffrage was broadened. Although the West was not pleased, the leaders of the slave-holding counties threatened secession.

In the national elections of 1860 Virginia returned a majority of unionist electors as against the secession candidates, Breckinridge and Lane, many of the large planters voting for the continuance of the Union, and many of the smaller slave-owners supporting the secessionists. The governor called an extra session of the legislature soon after the Federal election, and this in turn called a Convention to meet on the 13th of February 1861. The majority of this body consisted of Unionists, but the Convention passed the ordinance of secession when the Federal government (April 17) called upon the state to supply its quota of armed men to suppress "insurrection" in the lower Southern states. An alliance was made with the provisional government of the Confeder ate States, on April 25, without waiting for the vote of the people on the ordinance. The Convention called out 10,000 troops and appointed Colonel Robert E. Lee of the United States army as commander-in-chief. On the 23rd of March the people of the eastern counties almost unanimously voted approval of the acts of the Convention, and the western counties took steps to form the state of West Virginia (q.v.). Richmond soon became the capital of the Confederacy.

The Civil War was already begun, and Virginia was necessarily the battle-ground. Of the six great impacts made upon the Confederacy, four were upon Virginian soil: the first Manassas campaign (1861), the Peninsula battles (1862), second Manassas (1862), Fredericksburg, Chancellorsville (1862-63) and the great Wilderness-Petersburg series of attacks (1864-65). About 90,000 men were killed in Virginia, and probably 100,000 died of wounds and disease. The principal battles were: the first Manassas, or Bull Run (July 21, 1861); those around Richmond (June 26-July 2, 1862); second Manassas (August 29-30); Fredericksburg (December 12, 1862); Mechanicsville (May 2 and 3, 1863); the Wilderness (May 5 and 6); Spotsylvania (May 8); North Anna and Bethesda (May 30-June 1); Cold Harbor (June 3); Petersburg (June 15, July 30 and November 1, 1864); and Five Forks (April 1) and Appomattox (April 9-12, 1865).

With the surrender of the Confederate army under General Lee to Grant at Appomattox the task of reconstruction began. President Lincoln offered a very liberal plan of re-establishing the civil authority over the counties east of the Allegheny mountains, and Governor Francis H. Pierpont set up in Richmond a government, based upon the Lincoln plan and supported by President Johnson, which continued till the 2nd of March 1867, when the famous reconstruction order converting the state into Military District No. 1 was issued. General John M. Schofield was put in charge, and under his authority a constitutional Convention was summoned which bestowed the suffrage upon the former slaves, who, led by a small group of whites, who had come into the state with the invading armies, ratified the 14th and 15th amendments to the Federal Constitution and governed the community until 1869. Then the secessionists and Union men of 1861 united and regained control. Virginia was readmitted to the Union on the 26th of January 1870. The Constitution of the reconstruction era was unchanged until 1902, when the present fundamental law was adopted.

In national elections the state has supported the Democratic party, except in 1860, when its vote was cast for John Bell, the candidate of the Constitutional Union party.

GOVERNORS OF VIRGINIA

Under the Company

Edward Maria Wingfield, President of the Council
John Ratcliffe, President of the Council
John Smith, ... ... ...
George Percy, ... ... ...
Thomas West, Lord Delaware, Governor and Captain General
George Percy, Deputy Governor
Sir Thomas Dale, "High Marshall" and Deputy Governor
Sir Thomas Gates, Acting Governor
Sir Thomas Dale, ... ... ...
George Yardeley, Lieutenant or Deputy Governor
Sir George Yardeley, ... ... ...
Samuel Argall, Lieutenant or Deputy Governor
Nathaniel Powell, Acting Governor
George Yardeley, Governor
Sir Francis Wyatt, ... ... ...

VIRGINIA, UNIVERSITY OF, a state institution for higher education, situated at Charlottesville among the foot-hills of the Blue Ridge Mountains. Its buildings, arranged around
a large rectangular lawn and erected from a plan prepared by Thomas Jefferson, are noted for their architectural effect. At the head of the lawn is the Rotunda, modelled after the Roman Pantheon and now containing the university library; and at the foot of the lawn are three modern recitation and laboratory buildings. On the sides are grouped buildings for each individual professor and dormitories for students. There are also a chapel, a gymnasium, a hospital, and on the summit of Mount Jefferson Hill, a mile south-west of the campus, is the M’Cormick Observatory. The university comprises twenty-six independent schools, but the courses of instruction given in these are so co-ordinated as to form six departments: two academic—the college and the department of graduate studies; and four professional—law, medicine, engineering, and agriculture. The institution owns 532 acres of land, has productive endowment funds amounting to $1,975,000, and receives from the state an annual appropriation of $86,000. It is governed by a rector, chosen by and from nine visitors, and a board of philosophy, moral philosophy, chemistry and mediæ in corpore, the state superintendent of public instruction and the president of the university; and the corporate name of the university is "The Rector and Visitors of the University of Virginia.” In 1804 Edwin Anderson Alderman (b. 1861) was elected president. In 1910 the faculty and officers numbered 110, the students (men only) 893, and the number of volumes in the libraries 88,000.

The university traces its beginning to an act of the legislature in January 1823 for incorporating the “Trustees of Albemarle Academy.” On May 24, 1814, before the site of this proposed institution had been chosen, Thomas Jefferson was elected a trustee, and under his influence the legislature, in February 1816, authorized the establishment of Central College in lieu of Albemarle Academy. The cornerstone of Central College was laid in October 1817, and Jefferson, who was rector of its board of trustees, early planned a park for its development into the university of Virginia. The legislature, thanks to the efforts of Joseph Carrington Cabell, a close personal friend of Jefferson, adopted the plan in 1818 and 1819, and seven independent schools—ancient languages, modern languages, mathematics, natural philosophy, chemistry and mediæ in corpore, opened to students in March 1825; a school of law was opened in 1826. In 1825 the School of Medicine became a department of three individual schools; and in 1830 the School of Law became a department of two schools. After the gift of $300,000 by Andrew Carnegie there were established in 1909 the Andrew Carnegie School of Engineering, the James Madison School of Law, the James Monroe School of International Law, the James Wilson School of Political Economy, the Edgar Allan Poe School of English and the Walter Reed School of Pathology.

Under Jefferson’s plan only two degrees were granted: “Graduate,” to any student who had completed the course of any one school; and “Doctor” to a graduate in more than one school who had shown powers of research. But in 1831 for the Doctor’s degree the faculty substituted, following British custom, the degree of Master of Arts. The college now grants the degrees of "Bachelor of Arts," "Cultural Bachelor of Science" and "Vocational Bachelor of Science"; the Department of Graduate Studies, the degrees of "Graduate in a School," "Master of Arts," "Master of Science" and "Doctor of Philosophy"; the Department of Law, the degree of "Bachelor of Laws"; the Department of Medicine, the degree of "Doctor of Medicine"; the Department of Engineering, the degrees of "Civil Engineer," "Mechanical Engineer," "Electrical Engineer," "Mining Engineer" and "Chemical Engineer"; and the Department of Agriculture, the degree of "Bachelor of Science in Agriculture." See J. S. Patton, Jefferson, Cabell and the University of Virginia (New York, 1906).

VIRGIN ISLANDS, a group of small islands in the West Indies, about 100 in number, for the most part uninhabited. They extend E. from Puerto Rico, lying between 17° and 19° N. and 65° and 68° W., their total area being about 465 sq. m. The islands are mostly rocky, or sandy and barren, but such portions as are under cultivation yield sugar, maize, coffee, cotton and indigo. Guinea grass grows abundantly on the hillsides, affording excellent pastureage; the forests, though few, include the mahogany and other useful trees. The coasts abound with fish. The climate is more healthy than that of the other West Indian islands, and the heat is not so great. Some of the islands belong to the United States, some to Denmark and some to Great Britain. The United States’ possessions (once dependencies of Puerto Rico, but ceded by Spain in 1898) have an area of about 150 sq. m, and include Culebra or Snake Island, and Vieques or Crab Island. The chief Danish islands are St Thomas (q.v.), St Croix (q.v.) and St John (q.v.), the total area being about 240 sq. m. Of the British portion of the group the principal are Tortola, Anegada, Virgin Gorda, Jost van Dyke, Peter’s Island and Salt Island, in all numbering 32, with an area of 25 sq. m. With the exception of the island of Sombrero they form one of the five presidencies in the colony of the Leeward Islands. The inhabitants are peasant proprietors, mainly engaged in raising cattle and in burning charcoal, but some are fishermen and boatmen. The chief town is Roadtown (pop. 400) at the head of a splendid harbour on the S. of Tortola, and what trade there is is mostly with St Thomas. Sombrero is maintained as a lighthouse by the British government. Population of the presidency, mostly negroes (1891) 4639; (1901) 4908.

The Virgin Islands were discovered by Columbus in his second voyage, in 1494, and named Las Virgenes, in honour of St Ursula and her companions. In 1666 the British established themselves on Tortola, which has ever since remained in their possession. In the 17th century the Virgin Islands were favourite resorts of the buccaneers. The Danish islands of St Thomas and St John were taken by the British in 1672 but restored in the following year. In 1807 they surrendered to the British, and continued in their hands till 1815, when they were again restored.

VIRGNIUS RUFUS, LUCIUS (A.D. 15-97), Roman patriot and soldier, three times consul (A.D. 63, 69, 97), was born near Comum, the birthplace of the two Plinys. When governor of upper Germany under Nero (68), after he had put down the revolt of Julius Vindex in Gaul, he was more than once urged by his troops to assume the supreme power; but he firmly refused, and further declared that he would recognize no one as emperor who had not been chosen by the senate. Galba, on his accession, aware of the feelings of the German troops and uncertain as to the intentions of Virginius, induced him to accompany him to Rome. But Virginius, as always, remained loyal to the head of the state. After the death of Otho, the soldiers again offered the throne to Virginius, but he again refused it. Considering themselves slighted, they drew their swords upon him, and he only saved himself from their hands by making his escape through the back of the tent. But the soldiers never forgave him his failure in rising. Being a military disturbance at Ticinum, one of Virginius’s slaves was arrested and charged with the design of murdering the emperor. Virginius was accused of being implicated in the conspiracy, and his death was loudly demanded by the soldiers. To his credit Vitellius refused to sacrifice so valuable a servant, on whose loyalty he could depend, to the vengeance of a capricious army. Virginius subsequently lived in retirement, chiefly in his villa at Alsum, on the coast of Etruria, till his death in 97, in which year he held the consulship, together with the emperor Nerva. At the public burial with which he was honoured, the historian Tacitus (then consul) delivered the funeral oration. The younger Pliny, his neighbour and ward, has recorded the lines which Virginius had ordered to be engraved upon his tomb: "Hic situs est Rufus, pulso qui Vindici quondam Imperium asserit vestrum non sibi sed patriae." See Tacitus, Hist. i. ii.; Dio Cassius lxii. 24-27, lxiv. 4. lxviii. 2; Pliny, Ep. ii. 1, vi. 10; Juvenal viii. 221, with his master’s note; L. Paul in Rheinisches Museum (1899), liv. pp. 602-30.

VIRGO ("the Virgin"), in astronomy, the sixth sign of the zodiac (q.v.), denoted by the symbol Υ. It is also a constellation mentioned by Eudoxus (4th century b.c.) and Aratus (3rd century b.c.); Ptolemy catalogued 32 stars, Tycho Brahe 33.
VIRUÉS–VISCHER (FAMILY)

Hevedius 5°. The Greeks represented this constellation as a virgin, but different fables are current as to the identity of the maid. She is variously considered to be: Justitia, daughter of Asterius and Ancora, who lived before man sinned, and taught him his duty, and when the golden age ended she returned to heaven; according to Hesiod the virgin is the daughter of Jupiter and Themis; others make her to be Erigone, daughter of Icarius, or Parthenia, daughter of Apollo. The most interesting stars of this constellation are: α Viriν is, or Spica, a star of the first magnitude with a very faint companion; and γ Viriνis, a binary star, having components of the third magnitude.

VIRUÉS, CHRISTOPH (1520–1579). S. by I. of Stockholm by the dyane and returned to the ancient monastic house of San Valentín about the middle of the 16th century, joined the army, fought at Lepanto, and retired to his native place with the rank of captain shortly before 1586. The first-fruit of his leisure was El Monserrate (1587), a dull poem on a repulsive subject which had the honour of being praised by Cervantes, and of being reprinted in 1601. Shortly afterwards Virués returned to Italy and issued a recast of his poem entitled El Monserrate segundo (1602). His Obras trágicas y líricas (1600) include five tragedies: La Gran Semiramis, La Cruz Casandra, Atila furioso, La Insufle Marcela and Elisa. Dido. The date of his death is not known, but he is considered to have been alive as early as 1614. Virués belongs to the school of dramatists displaced by Lope de Vega, and his methods were out of fashion before his plays were printed; yet he is an interesting figure, chiefly because of the very extravagances which degrade the effect of his best scenes.

VISBY, or Vissuy, the capital of the Swedish island and administrative district (län) of Gotland, in the Baltic Sea. Pop. (1900) 8376. It is the seat of a bishop, the port of the island, and a favourite watering-place. It is picturesquely situated on the west coast, the south side of a bay, with a gable-like shore; the church is on an eminence. The church is beneath a cliff (klint) 100 ft. high, and the town is thoroughly medieval in appearance. The remains from its period of extraordinary prosperity from the 11th to the 14th century are of the highest interest. Its walls date from the end of the 13th century, replacing earlier fortifications, and enclose a space much larger than that now covered by the town. Massive towers rise at close intervals along them, and nearly forty are in good preservation. Between them are traces of barizans. The cathedral church of St Mary dates from 1198–1225, but has now been altered and carried up. It has a square tower at the west end and two graceful octagonal towers at the east, and contains numerous memorials of the 17th century. There are ten other churches, in part ruined, none of which is used for service. Among those of chief interest St Nicholas, of the early part of the 13th century, formerly belonged to a Dominican monastery. It retains two beautiful rose-windows in the west front. The church of the Holy Ghost (Helgeands-Kyrka) in a late Romanesque style (c. 1250) is a remarkable structure with a nave of two storeys. The Romanesque St Clement's has an ornate south portal, and the churches of St Doro and St Lars, of the 13th century, are notable for their huge towers. St Catherine's, of the middle of the 13th century, is Gothic, with a pentagonal apse. It belonged to a Franciscan convent, of the buildings of which there are slight ruins. Among ancient remains in the vicinity may be mentioned Galghberget, the place of execution, with tall stone pillars still standing; and the remarkable stone labyrinth of Tröjeborg. Modern buildings include the Gotland museum of antiquities, and the high school, with a museum and library. The artificial harbour, somewhat exposed, lies south of the town; it has a great lighthouse, not far from the old sanatorium, the great lighthouse, not far from the island.

The name Visby is derived from the old Norse ve (sanctuary) and by (town). This was no doubt a place of religious sacrifice in heathen times. At any rate it was a notable trading-place and emporium as early as the Stone Age, and continued to enjoy its importance as such through the Bronze and Iron Ages, as is proved, inter alia, by the large number of Arabic, Anglo-Saxon and other coins which have been found on the island. See Gotland and Sea Laws.

VISCACHA, or Biscacha, a large South American burrowing rodent mammal belonging to the family Chinchillidae and commonly known as Lagostomus trichodactylus, although some writers prefer the name Viscacia. With the cheek-teeth formed of a number of parallel plates in the manner characteristic of the family, the viscacha is distinguished from the other members of that group by having only three hind toes; while it is also the heaviest-built and largest member of the group, with small ears and a very short tail. The general colour of the latter being dark grey, with conspicuous black and white markings on the face. Viscachas inhabit the South American pampas between the Uruguay river and the Rio Negro in Patagonia, where they dwell in Warrens covering from 100 to 200 sq. ft. and forming mounds penetrated by numerous burrows. The ground around the "viscachers" is cleared from vegetation, the refuse of which is heaped upon the mound. Anything the rodents may meet with on their journeys, such as thistle-stalks or bones, are gathered up and deposited in the burrow. Deep down in the burrows dwell the viscachas, from which in frequented districts they seldom emerge till evening, unless to drink after a shower. Their chief food is grass and seeds, but they also consume roots. When alarmed, they rush to their burrows, and if these are disturbed utter a growling sound. A pair of prairie burrowing owls (Spectofo) are almost invariably inhabitants of a viscachera (see Rodentia). (R. L.)

VISCHER, the name of a family of Nuremberg sculptors, who contributed largely to the masterpieces of German art in the 15th and 16th centuries. 1. Hans (1430–1507) came to Nuremberg as a worker in brass in 1453 and there became a "master" of his guild. There is only one work that can be ascribed to him with certainty, the baptismal font in the parish church of Wittenberg (1457). This is decorated with figures of the Apostles.

2. His son, Peter, the elder, was born about 1455 in Nuremberg, where he died on the 7th of January 1526. He became "master" in 1489, and in 1494 was summoned by the Electoral Prince Philipp of the Palatinate to Heidelberg. He soon returned, however, to Nuremberg, where he worked with the Fugger family. His chief works are: the tomb of Bishop Johannes IV., in the Breslau cathedral (1496); the tomb of Archbishop Ernest, in Magdeburg cathedral (1497); the shrine of Saint Sebal in the Sebaluskirche at Nuremberg, between 1508 and 1510; a large gilded ordered by the Fugger brothers in Augsburg (lost); a relief of the "Crowning of the Blessed Virgin" in the Erfurt cathedral (a second example in the Wittenberg Schlosskirche, 1521); the tombstones for Margareta Tucher in the Regensburg cathedral (1521), and for the Eiben family in the Agilenkirche at Nuremberg (1522); the epitaph for the cardinal Albrecht of Brandenburg in the collegiate church at Aschaffenburg (1526); the tomb of the electoral prince Frederick the Wise in the Schlosskirche at Wittenberg (1521); the epitaph of the duchess Helene of Mecklenburg in the cathedral at Schwerin. Besides these works there are a number of others ascribed to Peter the elder with less certainty. In technique few bronze sculptors have ever equalled him, but his designs are marred by an excess of mannered realism and a too exuberant fancy. His chief early work, the tomb of Archbishop Ernest in Magdeburg cathedral (1495), is still filled up and covered with the Apostles under semi-Gothic canopies; it is purer in style than the magnificent shrine of St Sebal, a tall canopied bronze structure, crowded with reliefs and statues of the most lavish way. The general form of the shrine is Gothic, but the details are those of the 16th-century Italian Renaissance treated

---

1 This great work is really a canopied pedestal to support and enclose the shrine, not the shrine itself, which is a work of the 14th century, having the gabled form commonly used in the middle ages for metal reliquaries.
VISCHER, F. T.—VISCONTI (FAMILY)

with much freedom and originality. Some of the statuettes of saints attached to the slender columns of the canopy are modelled with much grace and even dignity of form. A small portrait figure of Peter himself, introduced at one end of the base, is a marvel of clever realism: he has represented himself as a stout, bearded man, wearing a large heathen apron and holding under his left arm a tool of his trade. This is a remarkable example of the uncommercial spirit which animated the artists of that time, and of the evident delight which they took in their work. Dragons, grotesques and little figures of boys, mixed with graceful scroll foliage, crowd every possible part of the canopy and its shafts, designed in the most free and unconventional way and executed with an utter disregard of the time and labour which were lavished on them.

See R. Bauer, Peter Vischer und das alte Nürnberg (1886); C. Headlam, Peter Vischer (1901).

VISCHER, FRIEDRICH THEODOR (1807–1887), German writer on the philosophy of art, was born at Ludwigsburg on the 30th of June 1807, and was the son of a clergyman. He was educated at Tübingen, and began life in his father's profession. In 1835 he became Privatdozent in aesthetics and German literature at his old university, was advanced in 1837 to extraordinary professor, and in 1844 to full professor. In consequence, however, of his outspoken inaugural address, he was suspended for two years by the Württemberg government, and in his enforced leisure wrote the first two volumes of his Aesthetik, oder Wissenschaft des Schönen (1846), the fourth and last volume of which did not appear till 1857. Vischer threw himself heartily into the great German political movement of 1848–49, and shared the disappointment of patriotic democrats at its failure. In 1855 he became professor at Zürich. In 1866, his fame being now established, he was invited back to Germany with a professorship at Tübingen combined with a post at the Polytechnium of Stuttgart. He died at Gmunden on the 14th of September 1887. His writings include literary essays, collected under the titles Kritische Gänge and Altes und Neues, poems, an excellent critical study of Goethe's Faust (1875), and a successful novel, Auch Einer (1878; 25th ed., 1904). Vischer was not an original thinker, and his monumental Aesthetik, in spite of industry and learning, has not the higher qualities of success. He attempts the hopeless task of explaining art by the Hegelian dialectic. Starting with the definition of beauty as "the idea in the form of limited appearance," he goes on to develop the various elements of art (the beautiful, sublime and comic), and the various forms of art (plastic art, music and poetry) by means of the Hegelian antitheses—form and content, objective and subjective, inner conflict and reconciliation. The shape of the work also is repellently Hegelian, consisting of short highly technical paragraphs containing the main argument, followed by detailed explanations printed in different type. Still, Vischer had a thorough knowledge of every branch of art except music, and much valuable material is buried in his volumes. In later life Vischer moved considerably away from Hegelianism, and adopted the conceptions of sensual completeness and cosmic harmony as criteria of beauty; but he never found time to rewrite his great book. His own work as a literary artist is of high quality; vigorous, imaginative and thoughtful without academic technicality.

VISCONTI, the name of a celebrated Italian family which long ruled Milan; they claimed descent from King Desiderius, and in the 11th century possessed estates on Lake Como and Maggiora. A certain Ottone, who distinguished himself in the First Crusade, is mentioned in 1278 as viscount of Milan. The real basis for the family's dominion was laid, however, by another Ottone, a canon of Desio, appointed archbishop of Milan by Pope Urban IV. In 1262 through the influence of Cardinal Ubaldini. The Della Torre family, who then con-

trolled the city, opposed the appointment, and not until his victory at Desio in 1277 was Ottone able to take possession of his see. He imprisoned Napoleonole Della Torre and five of his relatives in iron cages, and directed his later efforts toward the advancement of his nephew Matteo. He died on the 16th of August 1278, and was succeeded by his son, Matteo, born in Invorio on the 15th of August 1255, succeeded his uncle as political leader of Milan, and although an uprising of the Della Torre in 1302 compelled him to take refuge at Verona, his steadfast loyalty to the imperial cause in Italy earned him the gratitude of Henry VII, who restored him to Milan in 1310 and made him imperial vicar of Lombardy. He brought under his rule Fiacenza, Tortona, Pavia, Bergamo, Vercelli, Cremona and Alessandria. An able general, he yet relied for his conquests more on diplomacy and bribery, and was esteemed as a model of the prudent Italo-Mauro, in his Gibelline policy, and quarrelling with Pope John XXII, over an appointment to the archbishopric of Milan, he was excommunicated by the papal legate Bertrand du Puy in 1322. He at one abdicated in favour of his son Galeazzo, and died at Cremona on the 24th of June of the same year. He left besides Galeazzo several sons: Marco, Lucchino, Giovanni and Stefano. Galeazzo I. (1277–1328), who ruled at Milan from 1322 to 1328, met the Holy Army which the pope had sent against the Visconti in Vaprio on the Adda (1327); his son John, who then ruled, was captured by the Bavarian. In 1327 he was imprisoned by the emperor at Monza because he was thought guilty of making peace with the church, and was released only on the intervention of his friend Castruccio Castracane. By his wife Beatrice d'Este he had the son Azzo who succeeded him. His brother Marco commanded a band of Germans, conquered Pisa and Lucca and died in 1329. Azzo (1302–1330), who succeeded his father in 1328, bought the title of imperial vicar for 25,000 florins from the same Louis who had imprisoned Galeazzo I. He continued his father's work of restoring the power of his house, in a revolt led by his cousin Lodrisio, reorganized the administration of his estates, built the octagonal tower of S. Gottardo, and was succeeded in turn by his uncles Lucchino and Giovanni. LUCCHINO made peace with the church in 1341, bought Parma from Obizzo d'Este and made Pisa dependent on Milan. Although he showed ability as general and governor, he was jealous and cruel, and was poisoned in 1349 by his wife Isabella Fieschi. GIOVANNI, brother of the preceding, archbishop of Milan and lord of the city from 1349 to 1354, was one of the most notable characters of his time. He befriended Petrarch, extended the Visconti sway over Bologna (1350), defeated Pope Clement VI, annexed Genoa (1355), and died on the 4th of October 1354 after having established the rule of his family over the whole of northern Italy except Fiemont, Verona, Mantua, Ferrara and Venice. The Visconti from the time of Archbishop Giovanni were no longer mere rivals of the Della Torre or dependants on imperial caprice, but real sovereigns with a recognized power over Milan and the surrounding territory. The state was partitioned on the death of Giovanni among his brothers Stefano's three sons, Matteo II., Galeazzo II. and Bernabo. MATTEO II., who succeeded to Bologna, Lodri, Fiacenza and Parma, abandoned himself to the most revolting immorality, and was assassinated in 1355 by direction of his brothers, who thenceforth governed the state jointly and with considerable ability. GALEAZZO II., who held his court at Pavia, was handsome and distinguished, the patron of Petrarch, the founder of the university of Pavia and a gifted diplomat. He married his daughter Violante to the duke of Clarence, son of Edward III. of England, giving a dowry of 200,000 florins; and his son Gian Galeazzo to Isabella, daughter of King John of France. He died in 1378. BERNABO, who held his court at Milan, was involved in constant warfare, to defy the expenses of which he instituted very oppressive taxes. He fought Popes Innocent VI. and Urban V., who proclaimed a crusade against him. He fought the emperor Charles IV., who declared the forfeiture of his fief. He
endowed his son with the state after the death of his brother, but his brave nephew Gian Galeazzo plotted against him and put him to death (1383). Gian Galeazzo, the most powerful of the Visconti, became joint ruler of the Milanese territories when his brother, Gaino, died in 1378 and sole ruler on the death of his uncle seven years later. He founded the cathedral of Milan, built the Certosa and the bridge across the Ticino at Pavia, improved the university of Pavia and established the library there, and restored the university at Piacenza. His bureaucratic government was excellent; he was an able and economical administrator, and was reputed to be one of the wealthiest princes of his time. He was ambitious to reduce all Italy under the sway of the Visconti. He conquered Verona in 1387, and in the following year, with the aid of the Venetians, took Padua. He plotted successfully against the rulers of Mantua and Ferrara, and now that the whole of Lombardy lay prostrate before him he turned his attention to Tuscany. In 1390 he bought Pisa and seized Siena. The emperor Wenceslaus had already conferred on him the title of duke of Milan for 100,000 florins, reserving only Pisa, and refused to take arms against him. Gian Galeazzo took Perugia, Lucca and Bologna (1400-1), and was besieging Florence when he died of the plague (3rd of September 1402) at the age of fifty-five years. His sons, Giovanni Maria and Filippo Maria, were mere boys at the time of his death, and were laid in the tomb with him in the celebrated condottiere Facino Cane de Cesale; but most of Gian Galeazzo's conquests were lost to his self-seeking generals. Giovanni Maria was proclaimed duke of Milan in 1402, displayed an insane cruelty, and was killed in 1412 by Ghibelline partisans. Filippo Maria, who became nominal ruler of Pavia in 1402, succeeded his brother as duke of Milan. Cruel and extremely sensitive about his personal ugliness, he nevertheless was a great politician, and by employing such powerful condottieri as Carmagnola, Puccinio and Francesco Sforza he managed to recover the Lombard portion of his father's duchy. From his marriage with the unhappy widow of the above-mentioned Facino Cane he received a dowry of nearly half a million florins. He died in 1447, the last of the Visconti in direct male line, and was succeeded in the duchy, after the shortlived Ambrosian republic, by Francesco Sforza, who had married his daughter Bianca in 1441 (see Sforza). Valentina (1366-1408), a daughter of Gian Galeazzo and a sister of the preceding, married Louis of Orleans in 1387, and it was from her that Louis XII. of France derived his claim to the duchy of Milan. Gian Galeazzo left no other legitimate male issue, except a bastard who was born in prison, and other towns but was despised and beheaded (1407) by Charles VI.'s governor of Genoa, under whose protection he had placed himself. Among collateral branches of the Visconti family were the counts of Saliceto, counts of Zagnano, lords of Brignano, marquis of San Giorgio di Borgoratto, marquis of Inverno and Marquisella Motta. Other branches attained to some prominence in the localities of Bari and of Tarento. Tekabalo Visconti of Piacenza became Pope Gregory X. in 1271. Among the Visconti lords of Fontaneto was Gasparo, who died in 1295. The archbishop of Milan, An Ignatius Visconti was minister general of the Jesuits (1755-52).

There is a contemporary history of the principal members of the family by Paolo Giovio, bishop of Nocera, which may be had in several editions. See J. Burchardt, The Civilization of the Renaissance in Italy, trans. by S. G. C. Middlemore (London, 1869); J. A. Symonds, Age of the Despot (New York, 1888); C. Magenta, I Visconti e gli Sforza nel Castello di Pavia (1885); A. Medin, I Visconti nella poesia contemporanea (Milan, 1891); F. Mugnier, "Les lettres des Visconti en Italie" in Mémoires et documents de la société savoisienne d'histoire et d'archéologie, vol. x. of the second series (1896). (C. H. A.)

VISCONTI-VENOSTA, EMILIO, MARQUIS (1820—98), Italian statesman, was born at Milan on the 22nd of January 1820. A disciple of Mazzini, he took part in all the anti-Austrian conspiracies until the ineffectual rising at Milan on the 6th of February 1853, of which he had foretold the failure, induced him to renounce his Mazzinian allegiance. Continuing, nevertheless, his anti-Austrian propaganda, he rendered good service to the national cause, but being molested by the Austrian police, was obliged in 1859 to escape to Turin, and during the war with Austria of that year was appointed by Cavour royal commissioner with the Garibaldian forces. Elected deputy in 1866, he accompanied Farini on diplomatic missions to Modena and Naples, and was subsequently despatched to London and Paris to acquaint the British and French governments with the course of events in Italy. As a recompense for the tact displayed on this occasion, he was given by Cavour a permanent appointment in the Italian foreign office, and was subsequently appointed under-secretary of state by Count Pasolini. Upon the latter's death he became minister of foreign affairs (24th March 1869) in the Minghetti cabinet, in which capacity he negotiated the September Convention for the evacuation of Rome by the French troops. Resigning office with Minghetti in the autumn of 1864, he was in March 1866 sent by La Marmora as minister to Constantinople, but was almost immediately recalled and reappointed foreign minister by Riccosi. Assuming office on the morrow of the second battle of Custozza, he succeeded in preventing Austria from burdening Italy with a proportion of the Austrian imperial debt, in addition to the Venetian debt proper. The fall of Riccosi in February 1867 deprived him for a time of his office, but in December 1869 he entered the Lanza-Sella cabinet as foreign minister, and retained his portfolio in the succeeding Minghetti cabinet until the fall of the Right in 1876. During this long period he was called upon to conduct the delicate negotiations connected with the Franco-German War, the occupation of Rome by the Italians, and the consequent destruction of the temporal power of the pope, the Law of Guarantees and the visits of Victor Emmanuel II. to Vienna and Berlin. Upon the occasion of his marriage with the daughter of the marquis Aliferi di Sostegno, grand-niece of Cavour, he was created marquis by the king. For a time he remained a member of the parliamentary opposition, and in 1874 was nominated senator. In 1875, after eighteen years' absence from active political life, he was chosen to be Italian arbitrator in the Bering Sea question, and in 1896 once more accepted the portfolio of foreign affairs in the Di Rudini cabinet at a juncture when the disasters in Abyssinia and the indiscreet publication of an Abyssinian Green Book had rendered the international position of Italy exceedingly difficult. His first care was to improve Franco-Italian relations by negotiating with France a treaty with regard to Tunis. During the negotiations relating to the Cretan question and the Greco-Turkish War, he secured for Italy a worthy part in the European Concert and placed Lord Salisbury in the hands of Kriegsminister Thessaly. Resigning office in May 1898, on a question of internal policy, he once more retired to private life, but in May 1899 again assumed the management of foreign affairs in the second Pelloux cabinet, and continued to hold office in the succeeding Saracco cabinet until its fall in February 1901. During this period his attention was devoted chiefly to the Chinese problem and to the maintenance of the equilibrium in the Mediterranean and the Adriatic. In regard to the Mediterranean he established an Italo-French agreement by which France tacitly recognized Italian claims to Tripoli, and Italy not to interfere with French policy in the interior of Morocco; and, in regard to the Adriatic, he came to an understanding with Austria guaranteeing the status quo in Albania. Prudence and sagacity, coupled with unequalled experience of foreign policy, enabled him to assure to Italy her full portion of influence in international affairs, and secured for himself the unanimous esteem of European cabinets. In recognition of his services he was created Knight of the Annunziata by Victor Emmanuel III. on the occasion of the birth of Victor Emmanuel's only daughter and heir, Grand Duchess Yolanda Margherita di Savoy (1st of June 1901). In February 1906 he was Italian delegate to the Monroe conference at Algeciras. An account of Visconti-Venosta's early life (down to 1850) is given in an interesting volume by his brother Giovanni Visconti-Venosta, Ricordi di Giovanna (Milan, 1894).
VISCOUNT

through O. Fr. viscomte, mod. vicomte, from Low Lat. vice-comites, cf. Portg. visconde, Ital. visconte), the title of the fourth rank of the European nobility. In the British peerage it intervenes between the dignities of earl and baron. The title is now purely one of honour, having long been dissociated from any special office or functions.

In the Carolingian epoch the vice-comites, or missi comitibus, were the deputies or vicars of the counts, whose official powers they exercised by delegation, and from these the viscounts of the time of Charlemagne and his successors understood the vicomtes became hereditary the same happened in the case of their lieutenants; e.g. in Narbonne, Nimes and Alby the viscounts had, according to A. Molinier, acquired hereditary rights as early as the beginning of the 10th century. Viscounts thus developed into actual fiefs, with their own jurisdiction, domain and seigniorial rights, and could be divided or even transmitted to females. Viscounts, however, continued, for some time to have no more than the status of lieutenants, calling themselves either simply vice-comites, or adding to this title the name of the counts from which they derived their powers. It was not till the 12th century that the universal tendency to territorialize the feudal dominions affected the viscountcies with the rest, and that the viscounts began to take the name of the most important of their patrimonial domains. Thus the viscounts of Poitiers called themselves viscounts of Thouars, and those of Toulouse viscounts of Bruniquel and Montelar. From this time the significance of the title was extremely various. Some viscounts, notably in the duchy of Aquitaine and the county of Toulouse, of which the size made an effective centralized government impossible, were great barons, whose authority extended over whole provinces, and who disputed for power on equal terms with counts and dukes. Elsewhere, on the other hand, e.g. in the Île de France, Champagne, and a great part of Burgundy, the vicomtes continued to be half feudatories, half officials of the counts, with the same functions and rank in the feudal hierarchy as the châtelains; their powers were jealously limited and, with the organization of the system of prévôts and bailifs in the 12th century, practically disappeared. In the royal domains especially, these petty feudatories could not maintain themselves against the growing power of the crown, and they were early assimilated to the prévôts; thus there is no record of a vicomte at Paris after 1027.

In Normandy, where from the first the central power had been strong, vicomtes appeared at a very early date as deputies of the counts (afterwards dukes) of the Normans: "They are both personal companions and hereditary nobles." When local Norman counts began in the 11th century, some of them had vicomtes under them, but the normal vicomte was still a deputy of the duke, and Henry I. largely replaced the hereditary holders of the vicomtes by officials. "By the time of the Conqueror the judicial functions of the viscount were fully recognized, and extended over the greater part of Normandy." Eventually almost the whole of Normandy was divided into administrative viscounties or bailiwicks by the end of the 12th century. When the Normans conquered England, they applied the term viscomte or viccomites to the shireifs of the English system (see SHERIFF), whose office, however, was quite distinct and was hardly affected by the Conquest.

Nearly four centuries later "viscount" was introduced as a peerage style into England, when its king was once more lord of Normandy. John, Lord Beaumont, K.G., who had been created count of Boulogne in 1346, was made Viscount Beaumont, February 12, 1440, and granted precedence over all barons, which was doubtless the reason for his creation. Within a year the feudal viscount of Beaumont in Normandy was granted to him and the heirs male of his body on the ground that he traced his descent from that district. In 1446 Lord Bourchier, who held the Norman countship of Eu, was similarly made a viscount. The oldest viscountcy now on the roll is that of Hereford, created in 1550; but the Irish viscountcy of Gormanston is as old as 1478. The dignity was sparingly conferred in the peerage of England till recent times, when the number of viscounts was increased by bestowing the dignity on retiring speakers (e.g. Viscounts Canterbury, Hampden, Peel, Selby) and ministers who accepted peerages (e.g. Viscounts Melville, Halifax, Knutsford, Landaff, Cross, Ridley, Goschen, St. Aldwyn, Morley of Blackburn, Wolverhampton).

A viscount is "Right Honourable," and is styled "My Lord." His wife, also, "Right Honourable," is a "viscountess," and their eldest "Honourable." They are styled "Lord" and daughters are "Honourable." The coronet first granted by James I. has on the golden circlet a row of fourteen small pearls set in contact, of which number in representations nine are shown. The scarlet parliamentary robe of a viscount has two and a half doublings of ermine.

VISHNU

(Sanskrit, "the worker," from root vish, "to work"), a solar deity, in later Hindu mythology a god of the first importance, one of the supreme trinity with Brahma and Siva, but in the Rig Veda only a minor deity. In the Vedic scriptures his only anthropomorphic characteristics are the frequently mentioned strides that he takes, and his being a youth vast in body. His essential feature is the three strides (vi-kram) with which he traverses the universe. Two of these steps are visible to men, but the third or highest is beyond mortal sight. These steps are symbolic of the rising, culminating and setting of the sun, the days of the year, and the movement of the sun through the three divisions of the universe. To-day Vishnu is adored by the Vishnavite sects as the equal or even the superior of Brahma, and is styled the Preserver. He is represented with four arms, and black in colour; in one hand he holds a club and in the others a shell, a discus and a lotus respectively. He rides on the Garuda, half man and half bird, having the head, wings, beak and talons of an eagle, and human body and limbs, its face being white, its wings red and its body golden. In his character as preserver of men Vishnu has from time to time become incarnate to rid the world of some great evil (see also BRAHMANISM and HINDUISM).

See A. A. Macdonell, Vedic Mythology (Strassburg, 1897); Sir W. Muir, Original Sanskrit Texts, iv. 63-298; Sir M. Monier-Williams, Brahmanism and Hinduism, iii. v. vi.

VISION

(from Lat. videre, to see), or SIGHT, the function, in physiology, of the organ known as the eye (q.e.). The sense of vision is excited by the influence of light on the retina, the special terminal organ connected with the optic nerve. By excitation of the retina, a change is induced in the optic nerve fibres, and is conveyed by these to the brain, the result being a luminous perception, or what we call a sensation of light or colour. If light were to act uniformly over the retina, there would be no image of the source of the light formed on that structure, and consequently there would be only a general consciousness of light, without reference to any particular object. One of the first conditions, therefore, of vision for useful purposes is the formation of an image on the retina. To effect this, just as in a photographic camera, refractive structures must be placed in front of the retina which will so bend luminous rays as to bring them to a focus on the retina, and thus produce an image. Through the animal kingdom various arrangements are found for this purpose; but they may be all referred to three types, namely—(1) eye-specks or eye-dots, met with in Medusae, Annelidæ, &c.; (2) the compound eye, as found in insects and crustaceans; and (3) the simple eye, common to all vertebrates. The eye-specks may be regarded simply as expansions of optic nerve filaments, covered by a transparent membrane, but having no refractive media, so that the creature would have the consciousness of light only, or a simple luminous impression, by which it might distinguish light from darkness. The compound eye consists essentially of a series of transparent...
cone-like bodies, arranged in a radiate manner against the inner surface of the cornea, with which their bases are united, while their apices are connected with the ends of the optic filaments. As each cone is separated from its neighbours, it admits only a ray of light parallel with its axis, and its apex represents only a portion of the image, which must be made up, like a mosaic-work, of as many parts as there are cones in the eye. When the cones are of considerable length, it is evident, from their form and direction, their apices being directed inwards, that the oblique rays emanating from a luminous surface will be cut off, and that only those rays proceeding along the axis of the cone will produce an effect. Thus distinctness or sharpness of definition will be secured. The size of the visual field will depend on the form and size of the eye, the outermost cones marking its limits. Consequently the size of the visual field will depend on the size of the segment of the sphere forming its surface. The eyes of many insects have a field of about half a sphere, so that the creature will see objects before and behind it as well as those at the side. On the other hand, in many the eyes have scarcely any convexity, so that they must have a narrow field of vision. For anatomical details, and diseases of the eye, see Eye; the pathological aspects of vision itself are treated at the end of this article.

1. PHYSICAL CAUSES OF VISION

A luminous sensation may be excited by various modes of irritation of the retina or of the optic nerve. Pressure, cutting or electrical shocks may act as stimuli, but the normal excitation is the influence of light on the retina. From a physical point of view, light is a mode of movement occurring in a medium, termed the aether, which pervades all space; but the physiologist studies the operation of these movements on the sentient organism as resulting in consciousness of the particular kind which we term a luminous impression. The outside of the retina is convex, and is marked off by a boundary of great accuracy; but the physiological effects depend upon such complex conditions as to make it impossible to state them in the same precise way. Thus, when we look at the spectrum, we are conscious of the sensations of red and violet, referable to its two extremities: the physicist states that red is produced by 302 billions of impulses on the retina per second, and that violet corresponds to 757 billions per second; but he has arrived at this information by inductive reasoning from facts which have not at present any physiological explanation. We cannot at present trace any connexion between these estimations and the 392 billions of impulses on the retina per second and a sensation of red. Below the red and above the violet end of the spectrum there are vibrations which do not excite luminous sensations. In the first case, below the red, the effect as a sensation is heat; and above the violet the result is that of chemical activity. Thus the method of dispersion of light, as is followed in passing a ray through a prism, enables us to recognize these general facts: (1) rays below the red excite thermal impressions; (2) from the lower red up to the middle of the violet, the thermal rays become gradually weaker until they have no effect; (3) from the lower red to the extreme violet, they cause luminous impressions, which reach their greatest intensity in the yellow; and (4) from about the end of the yellow to far beyond the extreme violet, the rays have gradually a less and less luminous effect, but they have the power of exciting such chemical changes as are produced in photography. In general terms, therefore, the lower end of the spectrum may be called thermal, the middle luminous, and the upper actinic or chemical; but the three merge into and overlap one another. It may be observed that the number of vibrations in the extreme violet is not double that of the low red, so that the sensibility of the eye to vibrations of light does not range through an octave. The ultra-violet rays may act on the retina in certain conditions, as when they are reflected by a solution of sulphate of quinine, constituting the phenomenon of fluorescence. Far above the violet are the Röntgen radiations and probably others.
The optical constants of the human eye may be still further simplified by assuming that the two principal points and the two nodal points respectively are identical. Thus we may construct a reduced eye, in which the principal point is 2-3448 mm. behind the cornea and the single nodal point is 1-4764 mm. in front of the posterior surface of the lens. The refracting surface, or lens, has a radius of 5 mm. and is 3 mm. behind the cornea; and the index of refraction is that of the aqueous humour, or \( \nu \), or 1.3379.

2. The Formation of an Image on the Retina.—This may be well illustrated with the aid of a photographic camera. If properly focused, an inverted image will be seen on the glass plate at the back of the camera. It may also be observed by bringing the eyeball of a rabbit near a candle flame. The action of a lens in forming an inverted image is illustrated by fig. 3, where the pencil of rays proceeding from \( A \) is brought to a focus at \( A' \) and those from \( B \) at \( B' \); consequently the image of \( AB \) is inverted as at \( A'B' \). The three characteristic features of the retinal image are: (1) it is reversed; (2) it is sharp and well defined if it be accurately focused on the retina; and (3) its size depends on the visual angle. If we look at a distant object, say a star, the rays reaching the eye are parallel, and in passing through the refractive media they are focused at the posterior focal point—that is, on the retina. A line from the luminous point on the retina passing through the nodal point is called the line of direction. If the luminous object be not nearer than, say, 60 yds. the image is still brought to a focus on the retina without any effort on the part of the eye. Within this distance, supposing the condition of the eye to be the same as in looking at a star, the image would be formed somewhat behind the posterior focal point, and the effect would be an indistinct impression on the retina. To obviate this, for near distances, accommodation, so as to adapt the eye, is effected by a mechanism to be afterwards described.

When rays, reflected from an object or coming from a luminous point, are not brought to an accurate focus on the retina, the image is not distinct in consequence of the formation of circles of diffusion, the production of which will be rendered evident by fig. 4. From the point \( A \) luminous rays enter the eye in the form of a cone, the kind of which will depend on the pupil. Thus it may be circular, or oval, or even triangular. If the pencil is focused in front of the retina, as at \( d \), or behind it as at \( f \), or, in other words, if the retina, in place of being at \( F \), be in the positions \( G \) or \( H \), there will be a luminous circle or a luminous triangular space, and many elements of the retina will be affected. The size of these diffusion circles depends on the distance from the retina of the point where the rays are focused: the greater the distance, the more extended will be the diffusion circle. Its size will also be affected by the greater or less diameter of the pupil. Circles of diffusion may be studied by the following experiment, called the experiment of Scheiner:

Let \( C \) be a lens, and \( DEF \) be screens placed behind it. Hold in front of the lens a card perforated by two holes \( A \) and \( B \), and allow rays from a luminous point \( a \) to pass through these holes. The point \( a \) on the screen \( E \) will be the focus of the rays emanating from \( a \); if \( a \) were removed farther from the lens, the focus would be on \( F \), and if it were brought near to \( C \), the focus would then be on \( D \). The screens \( F \) and \( D \) show two images on the point \( a \). If, then, we close the upper opening in \( AB \), the upper image \( m \) on \( F \) and the lower image \( n \) on \( D \) disappear. Suppose now that the retina is substituted for the screens \( D \) and \( F \); the contrary will take place, in consequence of the reversal of the retinal image. If the eye be placed at \( o \), only one image will be seen; but if it be placed either in the plane of \( F \) or \( D \), then two images will be seen, as at \( mm \), or \( nn \); consequently in either of these planes there will be circles of diffusion and indistinctness, and only in the plane \( E \) will there be sharp definition of the image.

To understand the formation of an image on the retina, suppose a line drawn from each of its two extremities to the nodal point and continued onwards to the retina, as in fig. 6, where the visual angle is \( \alpha \). It is evident that its size will depend on the size of the object and the distance of the object from the eye. Thus, also, objects of different sizes, \( c, d, e \) in fig. 6, may be included in the same visual angle, as they are at different distances from the eye. The size of the retinal image may be calculated if we know the size of the object, its distance from the nodal point \( o \), and the distance of the nodal point from the posterior focus.

Let \( A \) be the size of the object, \( B \) its distance from the nodal point, and \( C \) the distance of \( o \) from the retina, or 15 mm.; then the size of the retinal image \( \alpha = \frac{(A + 15)}{B} \). The smallest visual angle in which two distinct points may be observed is 60 seconds; below this, the two sensations fuse into one; and the size of the retinal image

---

**Fig. 5.**—Diagram illustrating the Experiment of Scheiner.

**Fig. 6.**—The Visual Angle.
corresponding to this angle is 0.04 mm, nearly the diameter of a single retinal rod or cone. Two objects, therefore, included in a visual angle of less than 60 seconds, appear as one point. A small visual angle is in most eyes a condition of sharpness of definition. With a large angle, objects appear less sharply marked. Acuteness is determined by a few retinal elements, or even only one, being affected. A very minute image, if thrown on a single retinal element, is apparently sufficient to excite it. Thus it is possible to see a brilliant point in an angle even so small as $\frac{1}{2}$ of a second, and a sharp eye can see a body the $\frac{1}{24}$th of a line in diameter—that is, about the $\frac{1}{24}$th part of an inch.

3. The Optical Defects of the Eye.—As an optical instrument, the eye is defective; but from habit, and want of attention, its defects are not appreciated, and consequently they have little or no influence on our sensations. These defects are chiefly of two kinds—(1) those due to the curvature of the refractive surfaces, and (2) those due to the dispersion of light by the refractive media.

(a) Aberration of Sphericity.—Suppose, as in fig. 7, M A K to be a refractive surface on which parallel rays from L to S impinge, it will be seen that those rays passing near the circumferences are brought to a focus at F; and those passing near the centre at F)—intermediate rays being focused at N. Thus on the portion of the axis between F and F there will be a series of focal points, and the effect will be a blurred and bent image. In the eye this defect is to a large extent corrected by the following arrangements: (1) the iris cuts off the outer and more strongly refracted rays; (2) the curvature of the cornea is more ellipsoidal than spherical, and consequently those farthest from the axis are least deviated; (3) the anterior and posterior curvatures of the lens are such that the one corrects, to a certain extent, the action of the other; and (4) the structure of the lens is such that its power of refraction diminishes from the centre to the circumference, and consequently the rays farthest from the axis are less refracted.

(b) Astigmatism.—Another defect of the eye is due to different meridians having different degrees of curvature. This defect is known as astigmatism. It may be thus detected: Draw on a sheet of white paper a vertical and a horizontal line, with ink, crossing at a right angle; at the point of distinct vision it will be found impossible to see the lines with equal distinctness at the same time; to see the horizontal line distinctly the paper must be brought near the eye, and removed from it to see the vertical. In the cornea the vertical meridian has generally a shorter radius of curvature, and is consequently more refractive than the horizontal. The meridians of the lens may also vary; but, as a rule, the asymmetry of the cornea is greater than that of the lens. The optical explanation of the defect will be understood with the aid of fig. 7.

Thus, suppose the vertical meridian C A D to be more strongly curved than the horizontal F A E, the rays which fall on C A D will be brought to a focus G, and those falling on F A E at B. If we divide the pencil of rays at successive points, G, H, I, K, B, by a section perpendicular to A B, the various forms it would present at these points are seen in the figures underneath, so that if the eye were placed at G, it would see a horizontal line a d; if at H, an ellipse with the long axis a d' parallel to A B; if at I, a circle; if at K, an ellipse, with the long axis b c, at right angles to A B; and if at B, a vertical line b c. The degree of astigmatism is ascertained by measuring the difference of refraction in the two chief meridians; and the defect is corrected by the use of cylindrical glasses, the curvature of which, added to that of the minimum meridian, makes its focal length equal to that of the maximum meridian.

(c) Aberration of Refrangibility.—When a ray of white light traverses on a lens, the different rays composing it, being unequally refrangible, are dispersed: the violet rays (see fig. 9), the most refrangible, are brought to a focus at e, and the red rays, least refrangible at d. If a screen were placed at e, a series of concentric coloured circles would be formed, the central being of a violet, and the circumference of a red colour. The reverse effect would be produced if the screen were placed at d. Imagine the retina in place of the screen in the two positions, the sensational effects would be those just mentioned. Under ordinary circumstances, the error of refrangibility due to the optical construction of the eye is not observed, as for vision at near distances the interval between the focal point of the red and violet rays is very small. If, however, we look at a candle flame through a bit of cobalt blue glass, which transmits only the red and blue rays, the flame may appear violet surrounded by blue, or blue surrounded by violet, according as we have accommodated the eye for different distances. Red surfaces always appear nearer than violet surfaces situated in the same plane, because the eye has to be accommodated more for the red than for the violet, and consequently we imagine them to be nearer. Again, if we contemplate red letters or designs on a violet ground the eye soon becomes fatigued, and the designs may appear to move.

(d) Defects due to Opacities, etc., in the Transparent Media.—When small opaque particles exist in the transparent media, they may cast their shadow on the retina so as to give rise to images which are projected outwards by the mind into space, and thus appear to exist outside of the body. Such phenomena are termed entoptic. They may be of two kinds: (1) extra-retinal, that is, due to opaque or semi-transparent bodies in any of the refractive structures anterior to the retina, and presenting the appearance of drops, striae, lines, twisted bodies, forms of grotesque shape, or minute black dots dancing before the eye; and (2) intra-retinal, due to opacities, etc., in the layers of the retina, in front of Jacob's membrane. The intra-retinal may be produced in a normal eye in various ways. (1) Throw a strong beam of light on the edge of the sclerotic, and a curious branched figure will be seen, which is an image of the retinal vessels. The construction of these images, usually called Purkinje's figures, will be understood from fig. 10. Thus, in the figure to the left, the rays passing through the sclerotic at b', in the direction b'' c, will throw a shadow of a vessel at c on the retina at b', and this will appear as a dark line at B. If the light move from b' to a', the retinal shadow will move from b' to a', and the line in the field of vision will pass from B to A.
It may be shown that the distance \( c' \) corresponds to the distance of the retinal vessels from the layer of rods and cones. If the light enter the cornea, as in the figure to the right, and if the light be moved, the image will be displaced in the same direction as the light, if the movement does not exceed the middle of the cornea, but in the opposite direction to the light when the latter is moved up and down. Thus, if \( a \) be moved to \( a' \), \( d \) will be moved to \( d' \), the shadow on the retina from \( c \) to \( c' \), and the image \( b \) to \( b' \). If, on the other hand, \( a \) be moved above the plane of the paper, \( d \) will move below, consequently \( c \) will move above, and \( b' \) will appear to sink. (2) The retinal vessels may also be seen by looking at a strong light through a minute aperture, in front of which a rapid to-and-fro movement is made. Such experiments prove that the sensitive part of the retina is its deepest and most external layer (Jacob's membrane).

4. Accommodation, or the Mechanism of Adjustment for Different Distances.—When a camera is placed in front of an object, it is necessary to focus accurately in order to obtain a clear and distinct image on the sensitive plate. This may be done by moving either the lens or the sensitive plate backwards or forwards so as to have the posterior focal point of the lens corresponding with the sensitive plate. For similar reasons, a mechanism of adjustment, or accommodation for different distances, is necessary in the human eye. In the normal eye, any number of parallel rays, coming from a great distance, are focused on the retina. Such an eye is termed emmetropic (fig. 11, A). Another form of eye (fig. 11, B) may be such that parallel rays are brought to a focus in front of the retina. This form of eye is myopic or short-sighted, inasmuch as, for distinct vision, the object must be brought near the eye, so as to catch the divergent rays, which are then focused on the retina. A third form is seen in C, where the focal point, for ordinary distances, is behind the retina, and consequently the object must be held far off, so as to allow only the less divergent or parallel rays to reach the eye. This kind of eye is called hypermetropic, or far-sighted. For ordinary distances, at which objects must be seen distinctly in everyday life, the fault of the myopic eye may be corrected by the use of concave and of the hypermetropic by convex glasses. In the first case, the posterior focal point a little farther back, and in the second the convex glass will bring it farther forwards; in both cases, however, the glasses may be so adjusted, both as regards refractive index and radius of curvature, as to bring the rays to a focus on the retina, and consequently secure distinct vision.

From any point 65 metres distant, rays may be regarded as almost parallel, and the point will be seen without any effort of accommodation. This point, either at this distance or in infinity, is called the punctum remotum, or the most distant point seen without accommodation. In the myopic eye it is much nearer, and for the hypermetropic there is really no such point, and accommodation is always necessary. If an object were brought too close to the eye for the refractive media to focus it on the retina, circles of diffusion would be formed, with the result of causing indistinctness of vision, unless the eye possessed some power of adapting itself to different distances. That the eye has such power of accommodation is proved by the fact that, if we attempt to look through the meshes of a net at a distant object, we cannot see both the meshes and the object with equal distinctness at the same time. Again, if we look continuously at very near objects, the eye speedily becomes fatigued. Beyond a distance of 65 metres, no accommodation is necessary; but within it, the condition of the eye must be adapted to the diminished distance until we reach a point near the eye which may be regarded as the limit of visibility for near objects. This point, called the punctum proximum, is usually 12 centimetres (or 4-8 inches) from the eye. The range of accommodation is thus from the punctum remotum to the punctum proximum.

The mechanism of accommodation has been much disputed, but there can be no doubt it is chiefly effected by a change in the curvature of the anterior surface of the crystalline lens. If we hold a lighted candle in front and a little to the side of an eye to be examined, three reflections may be seen in the eye, as represented in fig. 12. The first, \( a \), is erect, large and bright, from the anterior surface of the cornea; the second, \( b \), also erect, but dim, from the anterior surface of the crystalline lens; and the third, \( c \), inverted, and very dim, from the posterior surface of the lens. Thus it appears that the concave surface of the vitreous humour to which the convex surface of the lens is adapted. Suppose the three images to be in the position shown in the figure for distant vision, it will be found that the middle image \( b \) moves towards \( a \), on looking at a near object. The change is due to an alteration of the curvature of the lens, as shown in fig. 13. The changes occurring during accommodation are:

1. The curvature of the anterior surface of the crystalline lens increases, and may pass from 10 to 6 mm.; (2) the pupil contracts; and (3) the intraocular pressure increases in the posterior part of the eye. An explanation of the increased curvature of the anterior surface of the lens during accommodation has been thus given by H. von Helmholtz. In the normal condition, that is, for the emmetropic eye, the crystalline lens is flattened anteriorly by the pressure of the anterior layer of the capsule; during accommodation, the radiating fibres of the ciliary muscles pull the ciliary processes forward, thus relieving the tension of the anterior layer of the capsule, and the lens at once bulges forward by its elasticity.

By this mechanism the radius of curvature of the anterior
OPTICAL ARRANGEMENTS

surface of the lens, as the eye accommodates from the far to the near point, may shorten from 10 mm. to 6 mm. The ciliary muscle, however, contains two sets of fibres, the longitudinal or meridional, which run from before backwards, and the circular or equatorial (Müller's muscle), which run, as their name indicates, around the band of longitudinal fibres forming the muscle. Direct observation on the eye of an animal immediately after death shows that the fibres of the latter are not distinctly visible. It is not difficult, however, if we know the size of the object reflecting the light, and its distance from the eye, to calculate the radius of the curved surface (Appendix to M'Kendrick's Outlines of Physiology, 1878). The general result is that, in accommodation for near objects, the middle reflected image becomes smaller, and the radius of curvature of the anterior surface of the lens becomes shorter.

5. Absorption and Reflection of Luminous Rays from the Eye.

When light enters the eye, it is partly absorbed by the black pigment of the choroid and partly reflected. The reflected rays are returned through the pupil, and, if the eye be focused on an object in the same direction as the rays entering the eye, but uniting to form an image at the same point in space as the luminous object. The pupil of an eye appears black to an observer, because the eye of the observer does not receive any of those reflected rays.

If, however, we strongly illuminate the retina, and hold a lens in front of the eye, so as to bring the reflected rays to a focus nearer the eye, then, a virtual and erect, or a real and reversed, image of the retina will be seen. Such is the principle of the ophthalmoscope, invented by Helmholtz in 1857. Eyes deficient in pigment, as in albinos, appear luminous, reflecting light of a red or pink colour; but if we place in front of such an eye a card perforated by a round hole of the same diameter as the pupil, the face will appear quite dark, like the pupil of an ordinary eye. In many animals a portion of the fundus of the eyeball has no pigment, and presents an iridescent appearance. This is called a tapetum. It probably renders the eye more sensitive to light of feeble intensity.

6. Functions of the Iris.—The iris constitutes a diaphragm which regulates the amount of light entering the eyeball. The aperture in the centre, the pupil, may be dilated by contraction of a system of radiating fibres of involuntary muscle, or contracted by the action of another system of fibres, forming a ring around the margin of the pupil. The radiating fibres are controlled by the sympathetic, while those of the circular set are excited by the third cranial nerve. The variations in diameter of the pupil are determined by the greater or less intensity of the light acting on the retina. A strong light causes contraction of the pupil; with light of less intensity, the pupil will dilate. In the human being, a strong light acting on one eye will often cause contraction of the pupil, not only in the eye affected, but in the other eye. These facts indicate that the phenomenon is of the nature of a reflex action, in which the fibres of the optic nerve act as sensory. The diaphragm is a circular muscle attached to a centre in the encephalon, whence influences emanate which affect the pupil. It has been ascertained that if the fibres of the optic nerve be affected in any way, contraction of the pupil follows. The centre is in the anterior pair of the corpora quadrigemina, as destruction of these bodies causes immobility of the pupil. On the other hand, the dilating fibres are derived from the sympathetic; and it has been shown that they come from the lower part of the cervical, and upper part of the dorsal, region of the cord. But the iris seems to be directly susceptible to the action of light. Thus the pupil of the eye of a dead fish is not dilated for several hours, whereas, if the eye on the opposite side be covered, its pupil will remain widely dilated, as at the moment of death.

The pupil contracts under the influence—(1) of an increased intensity of light; (2) of the effort of accommodation for near objects; (3) of a strong convergence of the two eyes; and (4) of such active substances as nicotine, morphia and physostigmine; and it dilates under the influence—(1) of a diminished intensity of light; (2) of vision of distant objects; (3) of a strong excitation of any sensory nerve; (4) of dyspnoea; and (5) of such substances as atropine and hyoscyamine. The chief function of the iris is to so moderate the amount of light entering
the eye as to secure sharpness of definition of the retinal image. This it accomplishes by (1) diminishing the amount of light reflected from near objects, by cutting off the more divergent rays and admitting only those approaching a parallel direction, which, in a normal eye, are focused on the retina; and (2) preventing the error of spherical aberration by cutting off divergent rays which would otherwise impinge near the margins of the lens, and would thus be brought to a focus in front of the retina.

3. **Specific Influence of Light on the Retina**

The retina is the terminal organ of vision, and all the parts in front of it are optical arrangements for securing that an image will be accurately focused upon it. The natural stimulus of the retina is light. It is often said that it may be excited by mechanical and electrical stimuli; but such an observation really applies to the stimulation of the fibres of the optic nerve. It is well known that such stimuli applied to the optic nerve behind the eye produce always a luminous impression; but there is no proof that the retina, strictly speaking, is similarly affected. Pressure or electrical currents may act on the eyeball, but in doing so they not only affect the retina, consisting of its various layers and of Jacob’s membrane, but also the fibres of the optic nerve. It is possible that the retina, by which is meant all the layers except those on its surface formed by the fibres of the optic nerve, is affected only by its specific kind of stimulus, light. This stimulus affects the terminal apparatus as to set up actions which in turn stimulate the optic fibres. The next question naturally is—What is the specific action of light on the retina? A. F. Holmgren, and also J. Dewar and J. G. M’Kendrick, have shown that when light falls on the retina it excites a variation of the electrical current obtained from the eye by placing it on the cushions of a sensitive galvanometer. One electrode touches the vertex of the cornea and the other the back of the eyeball. The corneal vertex is positive to the back of the eye, or to the transverse section of the optic nerve. Consequently a current passes through the galvanometer from the cornea to the back. Then the *impact* of light causes an increase in the natural electrical current—during the *continuance* of light the current diminishes slowly and falls in amount even below what it was before the impact—and the *withdrawal* of light is followed by a rebound, or second increase, after which the current falls in strength, as if the eye suffered from fatigue.

It was also observed in this research that the amount of electrical variation produced by light of various intensities corresponded pretty closely to the results expressed by G. T. Fechner’s law, which regulates the relation between the stimulus and the sensational effect in sensory impressions. This law is, that the sensational effect does not increase proportionally to the stimulus, but as the logarithm of the stimulus. Thus, supposing the stimulus to be 10, 100 or 1000 times increased, the sensational effect will not be 10, 100 or 1000 times, but only 1, 2 and 3 times greater.

Such electrical phenomena probably result either from thermal or chemical changes in the retina. Light produces chemical changes in the retina. If a frog be killed in the dark, and if its retina be exposed only to yellow rays, the retina has peculiar purple colour, which is at once destroyed by exposure to ordinary light. The purple matter apparently is decomposed by light. An image may actually be *fixed* on the retina by plunging the eye into a solution of alum immediately after death. Thus it would appear that light affects the purple-matter of the retina, and the result of this chemical change is to stimulate the optic filaments; if the action be arrested, we may have a picture on the retina; but if it be not arrested, the picture is evanescent; the purple-matter is used up, and new matter of a similar kind is formed to take its place. The retina might, therefore, be compared to a sensitive photographic plate having the sensitive matter quickly removed and replaced; and it is probable that the electrical expression of the chemical changes is what has been above described.

**Influence of Light**

(c) *Phosgenes.*—Luminous impressions may also be produced by pressure on the eyeball. Such impressions, termed *phosgenes,* usually appear as a luminous centre surrounded by coloured or dark rings. Sometimes they seem to be small bright scintillations of various forms. Similar appearances may be observed at the moments of opening or of closing a strong electrical current transmitted through the eyeball.

(b) *The Retina’s Proper Light.*—The visual field, even when the eyelids are closed in a dark room, is not absolutely dark. There is a sensation of faint luminosity which may at one moment be brighter than at another. This is often termed the *proper light of the retina,* and it indicates a molecular change, even in darkness.

(d) *The Excitability of the Retina.*—The retina is not equally excitable in all its parts. At the entrance of the optic nerve, as was shown by E. Mariotte in 1668, there is no sensibility to light. Hence, this part of the retina is called the *blind spot.* If we shut the left eye, fix the right eye on the cross seen in fig. 15, and move the book towards and away from the eye, a position will be found when the round spot disappears, that is when its image falls on the entrance of the optic nerve. There is also complete insensibility to colours at that spot. The diameter of the optic papilla is about 8 mm., giving an angle of $6^\circ$; this angle determines the apparent size of the blind spot in the visual field, and it is sufficiently large to cause a human figure to disappear at a distance of two metres.

The yellow spot in the centre of the retina is the most sensitive to light, and it is chiefly employed in direct vision. Thus, if we fix the eye on a word in the centre of this line, it is distinctly and sharply seen, but the words towards each end of the line are vague. If we wish to see each word distinctly, we “run the eye” along the line—that is, we bring each successive word on the yellow spot. This spot has a horizontal diameter of 2 mm., and a vertical diameter of 8 mm., and it corresponds in the visual field to an angle of from 2 to 4°. The fossa in the spot, where there are no retinal elements except Jacob’s membrane, consisting here entirely of cones (2000 in number), is the area of most acute sensibility. This fossa has a diameter of only 2 mm., which makes the angle ten times smaller. Thus the field of distinct vision is extremely limited, and at the same moment we see only a very small portion of the visual field.

Images of external objects are brought successively on this minute sensitive area, and the different sensations seem to be fused together, so that we are conscious of the object as a whole.

Towards the anterior margin of the retina sensibility to light becomes diminished; but the diminution is not uniform, and it varies in different persons.

(d) *Duration and Persistence of Retinal Impressions.*—To excite the retina, a feeble stimulus must act for a certain time; when the retina is excited, the impression lasts after the cessation of the stimulus; but if the stimulus be strong, it may be of very short duration. Thus the duration of an electrical spark is extremely short, but the impression on the retina is so powerful, and remains so long, as to make the spark visible. If we rotate a disk having white and black sectors we see continuous dark bands. Even if we paint on the face of the disk a single large round red spot, and rotate rapidly, a continuous red band may be observed. Here the impressions of red on the same area of retina succeed each other so rapidly that before one disappears another is superadded, the result being a fusion of the successive impressions into a continuous sensation. This phenomenon is called the *persistence of retinal impressions.* An impression lasts on the retina from $3\pi$ to $5\pi$ of a second. The cinematograph owes its effects to persistence of retinal impressions.

(e) *The Phenomena of Irradiation.*—If we look at fig. 16, the white square in the black field appears to be larger than the black square in the white field, although both are of precisely
the same size. This is due to irradiation. The borders of clear surfaces advance in the visual field and encroach on obscure surfaces. Probably, even with the most exact accommodation, diffusion images form round the image of a white surface on a black ground, forming a kind of penumbra, thus causing it to appear larger than it really is.

(f) Intensity of Light required to Excite the Retina.—Light of intensity sufficient to excite the retina must have a certain intensity to produce a luminous impression. It is impossible to fix the minimum intensity necessary, as the effect will depend, not only on the intensity of the stimulus, but on the degree of retinal excitability at the time. Thus, after the retina has remained for some time in the dark, its excitability is increased; on the other hand, it is much diminished by fatigue. Aubert has stated that the minimum intensity is about 300 times less than that of the full moon. The sensibility of the eye to light is measured by the photometer.

(g) Consecutive Retinal Images.—Images which persist on the retina are either positive or negative. They are termed positive when the bright and obscure parts of the image are the same as the bright and obscure parts of the object; and negative when the bright parts of the object are dark in the image, and vice versa. Positive images are strong and sharply marked when an intense light has acted for not less than $\frac{1}{3}$ of a second. If the excitation be continued much longer, a negative and not a positive image will be seen. If, when the positive image is still visible, we look on a very brilliantly illuminated surface, a negative image appears. Negative images are seen with greatest intensity after a strong light has acted for a considerable time. These phenomena may be best studied when the retina is very excitable, as in the morning after a sound sleep. On awakening, if we look steadily for an instant at the window and then close the eyes, a positive image of the window will appear; if we then gaze fixedly at the window for one or two minutes, close the eyes two or three times, and then look at a dark part of the room, a negative image will be seen floating before us. The positive image is due to excitation of the retina, and the negative to fatigue. If we fatigue a small yellow area of the retina with white light, and then allow a less intense light to fall on it, the yellowish fatigued area responds feebly, and consequently the object, such as the window pane, appears to be dark.

4. SENSATIONS OF COLOUR

1. General Statement.—Colour (q.v.) is a special sensation excited by the action on the retina of rays of light of a definite wave-length. On the most likely hypothesis as to the physical nature of light, colour depends on the rate of vibration of the luminiferous aether, and white light is a compound of all the colours in definite proportion. When a surface reflects solar light into the eye without affecting this proportion, it is white, but if it absorbs all the light so as to reflect nothing, it appears to be black. If a body held between the eye and the sun transmits light unchanged, and is transparent, it is colourless, but if translucent it is white. If the medium transmits or reflects some rays and absorbs others, it is coloured. Thus, if a body absorbs all the rays of the spectrum but those which cause the sensation of green, we say the body is green in colour; but this green can only be perceived if the rays of light falling on the body contain rays having the special rate of vibration required for this special colour. For if the surface be illuminated by any other pure ray of the spectrum, say red, these red rays will be absorbed and the body will appear to be black. As a white surface reflects all the rays, in red light it will be seen to be red, and in a green light, green. Colour depends on the nature of the body and on the nature of the light falling on it, and a sensation of colour arises when the body reflects or transmits the special rays to the eye. If two rays of different rates of vibration, that is to say, of different colours, affect a surface of the retina at the same moment, the effects are fused together and we have the sensation of a third colour different from its cause. Thus, if red be removed from the solar spectrum, all the other colours combined cause a sensation of greenish yellow. Again red and violet give purple, and yellow and blue, white. Yellow and blue, however, only give white when pure spectral colours are mixed. It is well known that a mixture of yellow and blue pigments do not produce white, but green; but, as was explained by Helmholtz, this is because the blue pigment absorbs all the rays at the red end of the spectrum up to the green, while the yellow pigment absorbs all the rays at the violet end down to the green, and as the only rays reflected into the eye are the green rays, the substance appears green. Finally, if colours are painted on a disk in due proportions and in a proper order, the disk will, when quickly rotated, appear white, from the rapid fusion of colour effects.

When we examine a spectrum, we see a series of colours merging by insensible gradations the one into the other, thus—red, orange, yellow, green, blue and violet. These are termed simple colours. If two or more coloured rays of the spectrum act simultaneously on the same spot of the retina, they may give rise to sensations of mixed colours. These mixed colours are of two kinds: (1) those which do not correspond to any colour in the spectrum, such as purple and white, and (2) those which do exist in the spectrum. White may be produced by a mixture of two simple colours, which are then said to be complementary. Thus, red and greenish blue, orange and cyanic blue, yellow and indigo blue, and greenish yellow and violet all produce white. Purple is produced by a mixture of red and violet, or red and bluish violet. The following table by Helmholtz shows the compound colours produced by mixing other colours:

<table>

This table shows that if we mix two simple colours not so far separated in the spectrum as the complementary colours, the mixed colour contains more white as the interval between the colours employed is greater, and that if we mix two colours farther distant in the spectrum than the complementary colours, the mixture is whiter as the interval is smaller. By mixing more than two simple colours, no new colours are produced, but only different shades of colour.

2. Modes of Mixing Colour Sensations.—Various methods have been adopted for studying the effect of mixing colours.

(a) By Superposing Two Spectra.—This may be done in a simple way by having a slit in the form of the letter V (see fig. 17), of which the two portions $ab$ and $be$ form a right angle; behind this slit is placed a vertical prism, and two spectra are obtained.
as seen in fig. 18, in which \( b c d a \) is the spectrum of the slit \( ab \), and \( c e f d \) that of the slit \( cd \); the coloured spectra are contained in the triangle \( g f h \), and, by rotation, the effects of mixture of any two simple colours may be observed.

(b) By Method of Reflection.-Place a red wafer on \( b \), in fig. 19, and a blue wafer on \( d \), and the arrangement, will be that of purple; and by using wafers of different colours, many experiments may thus be performed.

(c) By Rotating Disks which quickly superpose on the same Area of Retina the Impressions of Different Wave-lengths.

Such disks may be constituted of cardboards on which coloured sectors are painted, as shown in fig. 20, the arrangement of Sir Isaac Newton. The angles of the sectors were thus given by him:

\[
\begin{align*}
\text{Red} & : 60^\circ 45'5' \\
\text{Orange} & : 34^\circ 10'5' \\
\text{Yellow} & : 34^\circ 41'3' \\
\text{Green} & : 60^\circ 45'5' \\
\text{Blue} & : 54^\circ 41'3' \\
\text{Indigo} & : 34^\circ 10'5' \\
\text{Violet} & : 60^\circ 45'5'
\end{align*}
\]

With sectors of such a size, white will be produced on rotating the disk rapidly. This method has been carried out with great efficiency by the colour-top of J. Clerk-Maxwell. It is a flat top, on the surface of which various colours may be placed. Dancer has added to it a method by which, even while the top is rotating rapidly and the sensation of a mixed colour is strongly perceived, the eye may be able to see the simple colours of which it is composed.

This is done by placing on the handle of the top, a short distance above the coloured surface, a thin black disk, perforated by holes of various size and pattern, and weighted a little on one side. This disk vibrates to and fro rapidly, and breaks the continuity of the colour impression; and thus the constituent colours are readily seen.

3. The Geometric Representation of Colours.—Colours may be arranged in a linear series, as in the solar spectrum. Each point of the line corresponds to a determinate impression of colour; the line is not a straight line, as regards luminous effect, but is better represented by a curve, passing from the red to the violet.

This curve might be represented as a circle in the circumference of which the various colours might be placed, in which case the complementary colours would be at the extremities of the same diameter. Sir Isaac Newton arranged the colours in the form of a triangle, as shown in fig. 21. If we place three of the spectral colours at three angles, thus—green, violet and red—the sides of the triangle include the intermediate colours of the spectrum, except purple.

The point \( S \) corresponds to white, consequently, from the intersection of the lines which join the complementary colours, the straight lines from green to \( S \), \( RS \) and \( VS \) represent the amount of green, red and violet necessary to form white; the same holds good for the complementary colours; for example, for blue and red, the line \( SR \) the amount of blue, and the line \( SR \) the amount of red required to form white.

Again, any point, say \( M \), on the surface of the triangle, will represent a mixed colour, the composition of which may be obtained by mixing the three fundamental colours in the proportions represented by the length of the lines \( M \) to \( G \), \( V \) and \( R \). But the line \( MG \) passes on to the yellow \( Y \); we may then replace the red and green by the yellow, in the proportion of the length of the line \( MY \), and mix it with violet in the proportion of \( SV \). The same colour would also be formed by mixing the amount \( MY \) of yellow with MS of white, or by the amount RM of red with the amount MD of greenish blue.

The following list shows characteristic complementary colours, with their wave-lengths (\( \lambda \)) in millionths of a millimetre:

- Red, \( \lambda \) 656.
- Orange, \( \lambda \) 665.
- Gold-yellow, \( \lambda \) 574.
- Yellow, \( \lambda \) 567.
- Greenish yellow, \( \lambda \) 594.
- Indigo-blue, \( \lambda \) 464.
- Violet, \( \lambda \) 457.

By combining colours at opposite ends of the spectrum, the effect of the intermediate colours may be produced; but the lowest and the highest, red and violet, cannot thus be formed. These are therefore fundamental or primary colours, colours that cannot be produced by the fusion of other colours. If now to red and violet we add green, which has a rate of vibration about midway between red and violet, we obtain a sensation of white. Red, green and violet are therefore the three fundamental colours.

4. Physiological Characters of Colours.—Colour physiologically is a sensation, and it therefore does not depend only on the physical stimulus of light, but also on the part of the retina affected. The power of distinguishing colours is greatest when they fall on, or immediately around, the yellow spot, where the number of cones is greatest. In these regions more than two hundred different tints of colour may be distinguished. Outside of this area lies a middle zone, where fewer tints are perceived, mostly confined to shades of yellow and blue. If intense coloured stimuli are employed, colours may be perceived even to the margin of the periphery of the retina, but with weak stimuli coloured objects may seem to be black, or dark like shadows. In passing a colour from the periphery to the centre of the yellow spot, remarkable changes in hue may be observed. Orange is first grey, then yellow, and it only appears as orange when it enters the zone sensitive to red. Purple and bluish green are blue at the periphery, and only show the true tint in the central region. Four tints have been found which do not thus change: a red obtained by adding to the red of the spectrum a little blue (a purple), a yellow of \( 574.5 \lambda \), a green of \( 495 \lambda \), and a blue of \( 477 \lambda \).

The question now arises, How can we perceive differences in colour? We might suppose a molecular vibration to be set up in the nerve-endings synchronous with the undulations of the luminiferous aether, without any change in the chemical constitution of the sensory surface, and we might suppose that where various series of waves in the aether corresponding to different colours act together, these may be fused together, or to interfere so as to give rise to a vibration of modified form or rate that corresponded in some way to the sensation. Or, to adopt another line of thought, we might suppose that the effect of different rays (rays differing in frequency of vibration and in physiological effect) is to promote or retard chemical changes in the sensory surface, "which again so affect the sensory nerves as to give rise to differing states in the nerves and the nerve centres, with differing concomitant sensations." The former of these thoughts is the foundation of the Young-Helmholtz theory, while the latter is applicable to the theory of E. Hering.
COLOUR SENSATION

5. Theories of Colour-Perception.—A theory widely accepted by physicists was first proposed by Thomas Young and afterwards by Helmholtz. It is based on the assumption that three kinds of nervous elements exist in the retina, the excitation of which gives respectively sensations of red, green, and violet. These may be regarded as fundamental sensations. Homogeneous light excites all three, but with different intensities according to the length of the wave. Thus long waves will excite most strongly fibres sensitive to red, medium waves those sensitive to green, and short waves those sensitive to violet. But this theory shows graphically the irrationality of the three sets of fibres. Helmholtz thus applies the theory:

1. Red excites strongly the fibres sensitive to red and feebly the other two—sensation: Red.
2. Yellow excites moderately the fibres sensitive to red and green, feebly the violet—sensation: Yellow.
3. Green excites strongly, feebly the other two—sensation: Green.
4. Blue excites moderately the fibres sensitive to green and violet, and feebly the red—sensation: Blue.
5. Violet excites strongly the fibres sensitive to violet, and feebly the other two—sensation: Violet.
6. When the excitation is nearly equal for the three kinds of fibres, then the sensation is White.

The Young-Helmholtz theory explains the appearance of the consecutive coloured images. Suppose, for example, that we look at a red object for a considerable time: the retinal elements sensitive to red become fatigued. Then (1) if the eye be kept in darkness, the fibres affected by red being fatigued do not act so as to give a sensation of red; (2) if the eye is exposed to green and of violet have been less excited, and this excitation is sufficient to give the sensation of pale greenish blue; (2) if the eye be fixed on a white surface, the red fibres, being fatigued, are not excited by the red rays contained in the white light; (3) if we look at a bluish green surface, the complementary red, the effect will be to excite still more strongly the green and violet fibres, and consequently to have a still more intense complementary image; (4) if we regard a red surface, the primitive colour, the red fibres are little affected in consequence of being fatigued, the green and violet fibres will be only feebly excited, and therefore only a very feeble complementary image will be seen; and (5) if we look at a surface of a different colour altogether, this colour may combine with that of the consecutive image, and produce a mixed colour; finally, on a yellow surface, we will see an image of an orange colour.

Every colour has three qualities: (1) hue, or tint, such as red, green, violet; (2) degree of saturation, or purity, according to the amount of white mixed with the tint, as we recognize a red or green as pale or deep; and (3) intensity, or luminosity, or brightness as when we designate the tint of a red rose as dark or bright. Two colours are identical when they agree as to these three qualities. Observation shows, however, that out of one hundred men ninety-six agree in identifying or in discriminating colours, while the remaining four show defective appreciation. This defect is about ten times less frequent in women. Colour-blindness, being innate and incurable, and it is due to an unknown condition of the retina or nerve centres, or both, and must be distinguished from transient colour-blindness, sometimes caused by the excessive use of tobacco and by disease. When caused by tobacco, the sensation of blue is the last to disappear. Absolute inability to distinguish colour is rare, if it really exists; in some rare cases there is only one colour sensation; and in a few cases the colour-blind fails to distinguish blue from green, or there is insensibility to violet. Daltonism, or red-green blindness, is, of red-gold and the green-blind, is the more common defect. Red appears to the red-blind person as a dark green or greenish yellow, yellow and orange as dirty green, and green is green and brighter than the green of the yellow and orange. To a green-blind person red appears as dark yellow, yellow is yellow, except a little lighter in shade than the red he calls dark yellow, and green is pale yellow.

According to the Young-Helmholtz theory, there are three fundamental sensations of red, green, and violet, and the combination of which all other colours may be formed, and it is assumed that there exist in the retina three kinds of nerve elements, each of which is specially responsive to the stimulus of waves of a certain length. These elements are corresponding to red are absent; and green-blindness, to the absence of the elements sensitive to green. A red-blind person the green and violet are equal, and to a green-blind person the red and violet are equal; they thus give sensations which to them constitute white, while to the normal eye the sensation is not white, but bluish green in the one case and yellow in the other. In other cases, the sensation of red has been added to the sensations of red and blue. It will be evident, also, that whiteness to the colour-blind eye cannot be the same as whiteness to the normal eye. No doubt this theory offers certain phenomena of colour-blindness can explain, but not the primary mixture images, and of contrast of colour, but it is open to various objections. It has no anatomical basis, as it has been found to be impossible to determine the existence or non-existence of kinds of nerve elements, or retinal elements, corresponding to the three fundamental sensations. Why should red to a colour-blind person give rise to a sensation of something like green, or why should it give rise to a sensation of red at all? Again, as already stated, in cases of colour-blindness due to tobacco or to disease, only blue may be seen, while it is said that the rest of the spectrum seems to be white. It is difficult to understand how white can be the sensation if the sensory cells are excited by long waves of green and violet having been excited, and this excitation is sufficient to give the sensation of pale greenish blue; (2) if the eye be fixed on a white surface, the red fibres being fatigued, are not excited by the red rays contained in the white light; (3) if we look at a bluish green surface, the complementary red, the effect will be to excite still more strongly the green and violet fibres, and consequently to have a still more intense complementary image; (4) if we regard a red surface, the primitive colour, the red fibres are little affected in consequence of being fatigued, the green and violet fibres will be only feebly excited, and therefore only a very feeble complementary image will be seen; and (5) if we look at a surface of a different colour altogether, this colour may combine with that of the consecutive image, and produce a mixed colour; finally, on a yellow surface, we will see an image of an orange colour.

Every colour has three qualities: (1) hue, or tint, such as red, green, violet; (2) degree of saturation, or purity, according to the amount of white mixed with the tint, as we recognize a red or green as pale or deep; and (3) intensity, or luminosity, or brightness as when we designate the tint of a red rose as dark or bright. Two colours are identical when they agree as to these three qualities. Observation shows, however, that out of one hundred men ninety-six agree in identifying or in discriminating colours, while the remaining four show defective appreciation. This defect is about ten times less frequent in women. Colour-blindness, being innate and incurable, and it is due to an unknown condition of the retina or nerve centres, or both, and must be distinguished from transient colour-blindness, sometimes caused by the excessive use of tobacco and by disease. When caused by tobacco, the sensation of blue is the last to disappear. Absolute inability to distinguish colour is rare, if it really exists; in some rare cases there is only one colour sensation; and in a few
5. The Movements of the Eye

1. General Statement. The globe of the eye has a centre of rotation, which is not exactly in the centre of the optic axis, but a little anterior. The point of rotation may vary, but it is termed the fixed point of rotation, of which there are three—an antero-posterior, a vertical and a transverse. In normal vision, the two eyes are always placed in such a manner as to be fixed on one point, called the fixed point or the point of regard. A line passing from the centre of rotation to the point of regard is called the line of regard. The two lines of regard form an angle at the point of regard, and the base is formed by a line passing from the one centre of rotation to the other. A plane passing through both lines of regard is called the plane of regard. With these definitions, we can now describe the movements of the eyeball, which are of three kinds: (1) First position. The head is erect, and the line of regard is directed towards the distant horizon. (2) Second position. This indicates all the movements round the transverse and horizontal axes. When the eye rotates round the first, the line of regard is displaced above or below, and makes with a line indicating its former position an angle termed by Helmholtz the angle of vertical displacement, or the ascensional angle; and when it rotates round the vertical axis, the line of regard is displaced from side to side, forming with the median plane of the eye an angle called the angle of lateral displacement. (3) Third order of positions. This includes all those which the good eye assumes in performing a rotary movement along with lateral or vertical displacements. This movement of rotation is measured by the angle which the plane of regard makes with the transverse plane, an angle termed the angle of rotation or of torsion.

The two eyes move together as a system, so that we direct the two lines of regard to the same point in space.

The eyeball is moved by six muscles, which are described in the article Eye (Anatomy). The relative attachments and the axes of rotation are shown in fig. 23.

The term visual field is given to the area intercepted by the extreme visual lines which pass through the centre of the pupil, the amount of dilatation of which determines its size. It follows the movements of the eye, and is displaced with it. Each point in the visual field has a corresponding point on the retina, but the portion, as already explained, which secures our attention is that falling on the yellow spot.

2. Simple Vision with Two Eyes. When we look at an object with both eyes, having the optic axes parallel, its image falls upon the two yellow spots, and it is seen as one object. If, however, we displace one eyeball by pressing it with the finger, then the image in the displaced eye does not fall on the yellow spot, and we see two objects, one of them being less distinct than the other. It is not necessary, however, in order to see a single object with two eyes that the two images fall on the two yellow spots; an object is always single if its image fall on corresponding points in the two eyes.

The eye may rotate round three possible axes, a vertical, horizontal and antero-posterior. These movements are effected by four straight muscles and two oblique. The four straight muscles arise from an inside of the orbit, and pass forward to be inserted into the front part of the eyeball, or its equator, if we regard the anterior and posterior ends of the globe as the poles. The two obliques (one originating at the back of the orbit) come, as it were, from the nasal side—the one goes above the eyeball, the other below, while both are inserted into the eyeball on the temporal side, the superior oblique above and the inferior oblique below. The six muscles work in pairs. The internal and external recti turn the eye round the vertical axis,
VISION

so that the line of vision is directed to the right or left. The superior and inferior recti rotate the eye round the horizontal axis, and thus the line of vision is raised or lowered. The oblique muscles turn the eye round an axis passing through the centre of the eye to the back of the head, so that the superior oblique muscle lowers, while the inferior oblique raises, the visual line. It was also shown by Helmholtz that the oblique muscles sometimes cause a slight rotation of the eyeball round the visual line. The position of the eyeball is maintained by the control of the will up to a certain point, but there are slighter movements that are altogether involuntary. Helmholtz studied these slighter movements by a method first suggested by F. C. Donders. By this method the apparent position of after-images produced by exhausting the retina, say with a red or green object, was compared with that of a line or fixed point gazed at with a new position of the eyeball. The ocular spectra soon vanish, but a quick observer can determine the coincidence of lines with the spectra. After producing an after-image with the head in the erect position, the head may be placed into any inclined position, and if the attention is then fixed on a diagram having vertical lines ruled upon it, it can easily be seen whether the after-image coincides with these lines. As the after-image must remain in the same position on the retina, it will be evident that if it coincides with the vertical lines there must have been a slight rotation of the eyeball. Such a coincidence always takes place, and thus it is proved that there is an involuntary rotation. This minute rotation enables us to judge more accurately of the position of external objects.

3. The horopter is the locus of those points of space which are simultaneously seen by the two eyes. It may be conceived as simple, as a matter of fact it is generally a line of double curvature produced by the intersection of two hyperboloids, or, in other words, it is a twisted cubic curve formed by the intersection of two hyperboloids which have a common generator. The curves pass through the nodal point of both eyes. An infinite number of lines may be drawn from any point of the horopter, so that the point may be seen as a single point, and these lines lie on a cone of the second order, whose vertex is the point. When we gaze at the horizon, the horopter is really a horizon plane passing through our feet. The horopter in this instance, if the ground on which we stand is plane, is the nodal line of the two eyes. Experiments show “that the forms and the distances of these objects which are situated in, or very nearly in, the horopter, are perceived with a greater degree of accuracy than the same forms and distances would be when not situated in the horopter” (M'Kendrick, Life of Helmholtz, 1890, p. 172 et seq.).

An object which is not found in the horopter, or, in other words, does not form an image on corresponding points of the retinae, is seen double. When the eyeballs are so acted upon by their muscles as to secure images on non-corresponding points, and consequently double vision, the condition is termed strabismus, or squinting, of which there are several varieties treated of in works on ophthalmic surgery. It is important to observe that in the fusion of double images we must assume, not only the correctness of the theory of corresponding points of the retina, but also that there are corresponding points in the brain, at the central ends of the optic fibres. Such fusion of images may occur without consciousness—at all events, it is possible to imagine that the cerebral effect (except as regards consciousness) would be the same when a single object was placed before the two eyes, in the parallel position, whether the individual were conscious or not. On the other hand, as we are habitually conscious of a single image, there is a psychical tendency to fuse double images when they are not too dissimilar.

4. Binocular Perception of Colour.—This may be studied as follows. Take two No. 3 eye-pieces of a Hartnick's microscope, or two eye-pieces of the same optical value from any microscope, place one in front of each eye, direct them to a clear window in daylight, keep them parallel, and two luminous fields will be seen, one corresponding to each eye. Then converge the two eye-pieces, until the two luminous circles cross, and the central part, like a bi-convex lens, will appear clear and bright, while the outer segments will be much less intense, and may appear even of a dim grey colour. Here, evidently, the sensation is due to a fusion of impressions in the brain. With a similar arrangement, blue light may be admitted by the one eye-piece and red by the other; and on the convergence of the two, a resultant colour, purple, will be observed. This may be termed the binocular vision of colours. It is remarkable that by a mental effort this sensation of a compound colour may be decomposed into its constituents, so that one eye will again see blue and the other red.

1. General Characters of Visual Perceptions.—All visual perceptions, if they last for a sufficient length of time, appear to be external to ourselves, erect, localized in a position in space and more or less continuous.

(a) Visual Sensations are referred to the Exterior.—This appears to be due, to a large extent, to habit. Those who have been born blind, on obtaining eyesight by an operation, have with the objects to be in close proximity to the eye, and have not had the distinct sense of exteriority which most individuals possess. Slowly, and by a process of education, in which the sense of touch played an important part, they gained the knowledge of the external relations of objects. Again, phosgenes, when first produced, appear to be in the eye, but when conscious of them, by an effort of imagination, we may transport them into space, although they never appear very far off.

(b) Visual Sensations are referred to Eject Objects.—Although the images of objects are inverted on the retina we see them erect. The explanation of the effect is that we are conscious of the image on the retina, but of the luminous object from which the rays proceed, and we refer the sensation in the direction of these rays. Again, in running the eye over the object, say a tall pole, from base to apex, we are not conscious of the different images on the retina, but of the muscular movements necessary to bring the parts successively on the yellow spot.

(c) Visual Sensations are referred to a Position in Space.—The localization of a luminous point in space can only be determined by observing its relations to other luminous points with a given position of the head and of the eye. For example, in a perfectly dark space, we cannot fix its exact position in space, but we may get some information of a vague character by moving the head or the eye. If, however, a second luminous point appears in the darkness, we can tell whether it is nearer or farther distant, above or below the first. So with regard to other luminous points we observe their reciprocal relations, and thus we localize a number of visual impressions. There are three principal directions in space: the transverse (breadth), the vertical (height) and the sagittal (depth). Luminous points may be localized either in the transverse or vertical directions. Here we have to do simply with localization on a surface. A number of points may be observed simultaneously (as when the eye is fixed) or successively (as when the eye moves). If the movement of the eye be made rapidly, the series of impressions from different points may be fused together, and we are conscious of a line, the direction of which is indicated chiefly by the muscular sensations felt. In following it, the case is different; as regards points in the sagittal direction.

We see only a single point of this line at a time; it may be a transverse series of retinal elements, A B, and each of these formed by a number of smaller elements, 1, 2, 3, 4, situated in the axis of each principal element; it may, on the other hand, the transverse line a b situated in space and formed by a series of points in juxtaposition.
Each of these points will impress a retinal element, and the result will be the perception of a transverse line; but this will not be the same for the points c, d, e, f, g, situated in space in a linear series, in the sagittal direction; only one of those points, e, will impress the corresponding retinal element, and we can see only one point at a time in the line eg. By accommodating successively, however, for the various points at different and considerable distances along the line eg, we may excite retinal elements in rapid succession. Thus, partly by the fusion of the successive impressions on the retina, and partly from the muscular sensations caused by repeated accommodations and possibly of ocular movements, we obtain a notion of depth in space, even with the use of only one eye. It is, however, one of the chief effects of binocular vision to give precision to the notion of space in the sagittal direction.

(d) Visual Sensations are Continuous.—Suppose the image of a luminous line falls on the retina, it will appear as a line although it is placed on perhaps 200 cones or rods, each of which may be separately excited, so as to cause a distinct sensation. Again, on the same principle, the impression of a superficial surface may be regarded as a kind of mosaic, made up of individual portions corresponding to the rods or cones on which the image of the surface falls. But in both cases the sensation is continuous, so that we see a line or a surface. The individual images are fused together.

2. Notions derived from Visual Perceptions.—When we look at any object, we judge of its size, the direction of its surfaces (unless it be a point), its distance from the eye, its apparent movement or fixity and its appearance of solidity.

(a) Apparent Size.—This, so far as regards a comparatively small object, depends on the size of the retinal image, as determined by the visual angle.

With a very large object, there is an appreciation of size from the muscular sensations derived from the movements of the eyeball as we "range" the eye over it. It is difficult to appreciate the distance separating two points between which there are other points, as contrasted with an apparently similar distance without intermediate points. For example, the distance A to B appears to be greater than from B to C, in fig. 26.

(b) Direction.—As the retina is a curved surface, a long straight line, especially when seen from a distance, appears curved. In fig. 27 a curious illusion of effort, when the lines will be seen as they really are.

(c) Apparent Distance.—We judge of distance, as regards large objects at a great distance from the eye—(1) from their apparent size, which depends on the dimensions of the visual angle, and (2) from the interposition of other objects between the eye and the distant object. Thus, at sea, we cannot form, without great experience, an accurate estimate of how many miles we are off the coast, and all know how difficult it is to estimate accurately the width of a river. But if objects be interposed between the eye and the distant object, say a few vessels at different distances at sea, or a boat in the river, then we have certain materials on which to form a judgment, the accuracy of which, however, even with these aids, will depend on experience. When we look at a near object, we judge of its distance chiefly by the sense of effort put forth in bringing the two lines of regard to converge upon it.

(d) The Movement of a Body.—If the eye be fixed, we judge of movement by successive portions of the retina being affected, and possibly also by a feeling of an absence of muscular contractions necessary to move the eyeballs.

When the eye moves, so as to "follow" the object, there is a sense of muscular effort, which is increased when, in addition, we require to move the head.

(e) The Apparent Solidity of an Object.—If we look at an object, say a cube, first with the right eye and then with the left, it will be found that the two images of the object are somewhat different, as in fig. 28. If, then, by means of a stereoscope, or by holding a card between the two eyes, and causing a slight convergence of the eyes, the two images are brought upon corresponding points of the two retinas, the image will at once be seen in relief.

(J. G. M.)

7. Errors of Refraction and Accommodation and their Curative Treatment

The following is a classification of the diseases of vision, from a medical point of view (see also Eye: diseases):

a. Errors of refraction: hyperopia, myopia, astigmatism, anisometropia, aphakia.

b. Errors of accommodation:

(1) Loss of accommodation

(a) From advancing years (presbyopia), or from debility.

(b) From paralysis (cycloplegia) due to—

1. Drugs such as atropine.

2. Systemic poisons: diptheria, influenza, syphilis, &c.

3. Diseases of the nervous system, concussion of the brain.

(2) Spasm of accommodation.

(3) Meridional asymmetrical accommodation by means of which low errors of astigmatism are corrected, producing eye-strain.

Hyperopia or Hypermetropia (H.) (Far-sight; German = Uebersicht).—This is a condition of the refraction of the eye in which, with the eye at rest, parallel rays of light focus beyond the retina, which means that the image of a distant object is not in focus when it meets the retina, because the eye is too short antero-posteriorly. Most eyes at birth are hyperopic, but as the child grows the eye also grows; when, however, this does not take place, or does not take place sufficiently, normal development is thus arrested. There are other conditions that cause hyperopia, but this shortening of the antero-posterior axis is by far the commonest.

Hyperopia is corrected by convex glasses (fig. 29), and the measurement of the hyperopia is that convex glass which enables the hyperopic eye, at rest, to see distinctly objects at a distance. When the hyperopia is not too high it can also be corrected by the eye itself by means of the ciliary muscle (muscle of accommodation) which causes the crystalline lens to become more convex, and thus brings about the same result as placing a convex glass before the eye.

In young people when the error is not too high this work is done unconsciously, vision appears to be perfect, and it is only by placing the eye under the influence of atropine that...
the defect is revealed. In the normal eye distant objects are focused on the retina without the use of the ciliary muscle, which is only employed when looking at near objects; but the hyperope has to use this muscle all his waking hours for both near and distant vision, so that his eyes are never at rest. Fortunately he has some compensation for this extra work, for in most hyperopes the ciliary muscle becomes more or less hypertrophied; but even so, if near work is at all excessive, or if the defect is associated with astigmatism or anisometropia, symptoms of eye-strain will sooner or later show themselves (see Eye-strain, below).

In older people a very common symptom is blurring of the type while reading; the book has to be put down and the eyes rested for some minutes before reading can be resumed. This is due to the fatigued ciliary muscle giving way and becoming unable to focus.

As we advance in years we lose accommodation power (see Presbyopia, below), so that the time comes to every hyperope, if he live long enough, when he not only has to use glasses for reading (at an earlier period than the normal person), but he also finds that he is gradually losing his distant vision. This is very alarming to many, until it is explained that all that has happened is the loss of power to correct the defect, which defect, of course, has always existed, and which in future will have to be corrected by suitable glasses. The higher the hyperopia the sooner will these symptoms manifest themselves.

In quite young children, sometimes the earliest sign of the presence of hyperopia is a convergent strabismus (internal squint). As a rule, this squint is nothing more than an over-accommodation brought about by over-accommodation in those who cannot dissociate their convergence and accommodation; if we remove the necessity for over-accommodation by correcting the defect with suitable glasses, the over-convergence disappears and the squint is cured.

The total hyperopia of the eye is divided into manifest hyperopia and latent hyperopia. Manifest hyperopia is expressed in amount by the strongest convex glass that allows clear distant vision when the eye is not under atropine. Latent hyperopia is the additional hyperopia which is revealed under atropine. With advancing years the latent hyperopia becomes more and more manifest, and between the ages of 45 and 50 the total hyperopia is entirely manifest.

In addition to the symptoms already described, a very common one among young hyperopes is spasm of the ciliary muscle. This cramp of the muscle causes distant objects to be very indistinct, improvement only taking place with a concave glass, and near work has to be approached very close to the eyes, thus giving a wrong idea that the child is suffering from myopia; by paralysing the ciliary muscle with atropine the spasm disappears and the true nature of the defect is revealed.

The treatment essentially consists in ascertaining the total hyperopia of the eye, and this can only be done satisfactorily, when latent hyperopia is present, by paralysing the accommodation, using atropine for those under 25, and homatropine for those between the ages of 25 and 35 or 40. Over 40 (and when the hyperopia is high, even at an earlier age) no cycloplegic is necessary—in fact it is in many cases dangerous, as an attack of glaucoma may be induced. (See Eye: Diseases.)

Having found the total hyperopia, we learn the amount of the latent hyperopia, and, roughly speaking, the convex glass required is equal to the whole of the manifest hyperopia added to, from one-third to a half, of the latent; but the treatment varies with the age of the individual and the amount of the hyperopia, and is too complicated to be detailed here.

Myopia (M.) (Short-sight).—Typical myopia is due to an elongation of the antero-posterior diameter of the eye, so that the retina is situated behind the principal focus, and only diver-

gent rays of light from a near point (fig. 30), or parallel rays made divergent by a concave glass (fig. 31), can come to a focus on the retina. In other words, the far point of a myope is at a short distance in front of the eye, the distance being the measure of the myopia.

A myope can see distinctly at a distance when the eye is at rest (i.e. when accommodation is not being used), with that concave glass whose focal length is equal to the distance of the far point from the eye, and the converse is true; the measurement of myopia is that concave glass with which the myopic eye sees distinctly objects at a distance, and its focal length is equal to the distance of the myope's far point from the eye.

The Causes of Myopia.—Although myopia is hereditary, it is, with few exceptions, not congenital. We have seen that almost all eyes are hyperopic at birth. The savage is rarely myopic; it is civilization that is responsible for it; the necessity for constantly adapting the eye for near objects means undue convergence. We find that myopia generally first shows itself at the age of 8 to ro, when school work begins in earnest—that is, when convergence is first used in excess—and there is no doubt that it is excessive convergence that is mostly responsible for the development of myopia. The over-used internal recti constantly pulling at the sclerotic tend to lengthen the antero-posterior diameter of the eye, and as this lengthening of the antero-posterior axis necessitates greater convergence still, a vicious circle is produced, and the myopia gradually increases. The hereditary character of myopia is explained by the existence in such eyes of an "anatomical predisposition" to myopia. The sclera is unusually thin, and consequently less able to resist the pull of the internal recti, and the relative position of the recti and the position of the optic nerve, both of which may be hereditary, may be factors in the production of this defect. Anything which causes young subjects to approach their work too near the eyes may be the starting-point. Bad illumination, or the light coming from the wrong direction (for instance, in front), or defective vision produced by corneal nebulae, or lamellar cataract, &c., all necessitate over-convergence in order to obtain clearer images, and myopia may be produced.
It is interesting to note that when the work is approached very near the eye, but convergence is not used, as in the case of watchmakers, who habitually use a strong convex glass in one eye, there is no special tendency to myopia.

Some of the more common symptoms of myopia are:

1. Vision all errors is found distinctly (2) Near objects are seen distinctly, and the near point is much nearer than in the normal eye. (3) Acuteness of vision is often lowered, and especially this is the case in high myopia. (4) Eye-strain is often present, due to overuse of the muscles of convergence, and this may lead to (5) an external or divergent squint. (6) Floating black specks are often complained of, these are generally muscular volitantes, but often, especially in high myopia, may be actual opacities floating in the vitreous. (7) Myopes often stope and become "round shouldered" from the increased postural flexion inaugurated to correct the defect.

A small amount of myopia, if it is stationary, is in no sense a serious defect of the eye, the possessors of it are often quite unconscious of any deficiency in vision, and in fact brag that they have better vision than their fellows. The reason of this is that they learn in early life to recognize indistinct distant objects by the aid of other senses in a way that the ordinary individual can hardly understand, and in later life they can postpone the wearing of glasses for near work for many years, and sometimes until extreme old age. Unfortunately myopia is, as a rule, not stationary; it almost always tends to increase, and the inability to see objects close to the eyes, with serious changes may occur in the eyes as to lower the visual acuity enormously and sometimes lead to total loss of vision.

The treatment of myopia is general and local.

General Treatment.—The most important part of this is the preventive treatment (prophylaxis), especially in its application to children. All children who have one or both parents myopic are specially "marked down" for this defect, for they have probably inherited an anatomical predisposition. Bearing in mind that excessive convergence is the most potent cause of myopia, the most rigid precautions are paid to in the schoolroom. This room should be large, lofty and well ventilated, and have good-sized high windows on one wall, preferably on the north side. Each scholar should have an adjustable seat and desk so arranged that his head is upright and the work not too near his eyes. These desks should be arranged in rows so placed that the pupils sit with the light on their left. Schoolbooks must be clearly printed and the type should not be too small. The schloal work that needs close application of the eyes should be continued only for a short period at a time, the period alternating with other work which does not require the use of the eyes, such as mental arithmetic, blackboard exercises, paintings, reciting, etc. In play, the schoolmaster should teach more—that is, they should explain and impart knowledge by demonstrations and simple lectures, and reduce as much as possible the time spent in "home preparations," which is usually wasted for such work. The school is a place where all the problems of life are mentally tired. Even in the nursery the greatest care should be taken. The little ones should be supplied with large toys, a large box of colored cards to be used for writing, a picture book, and pictures should be discouraged, and close work that entails undue convergence, such as sewing, threading beads, &c., ought to be forbidden. The nursery governess can teach the alphabet, small words and even simple arithmetic with the bricks. No child with a tendency to myopia, or with a myopic family history should be allowed to learn to write or draw until at least seven years old. The child's bed should not be allowed to face the window, preferably it should be back to the light. Of course, in the schoolroom, which contains much work which entails close application for many hours a day, should be advised to regulate their work, if they are free to do so, by working for shorter periods and taking longer intervals of rest, they should be specially careful not to approach their work too near to the eyes and they should always work in a good light.

Local Treatment.—This consists in correcting the error with a lens. The testing must be done when the eye is under atropine in all those under 25, and under homatropine between the ages of 25 and 35 or 40. Over 40 no cycloplegic is required. Desert 0.1% atropine before playing rough games that glass, and the myopia is worn always. The wearing of glasses for near work produces at first considerable rebellion in children, because they can see near work so much better without a glass. The object of enforcing this treatment is to get rid of the muscle of accommodation, to do its work, and not only do we do this, but we also do away with the excess of convergence over accommodation, and lastly, make excessive convergence impossible, because, with the glasses on, the near work has to be held at a greater distance from the eyes.

In other words, we have practically made the eyes normal, and it is only by doing this that we can prevent the increase of myopia. Children who have never worn, their inspection (if the myopia is high) must have a weaker glass for near work. Each case must be treated on its own merits. So-called malignant myopia, which is high myopia with serious changes in the eye, must be treated in a special manner and with the greatest care.

Astigmatism.—The principal seat of astigmatism is the cornea, the curvature of one meridian being greater than that of the other. In regular astigmatism, which is the only form that can as a rule be treated by glasses, the meridians of greatest and least curvature are at right angles to each other, and the intermediate meridians pass by regular gradations from one to the other. Rays of light passing through such an astigmatic surface do not focus at one point, but form many points, with the result that the image is more or less indistinct according to the amount of the error. In uncorrected astigmatism a book placed at a distance certain, or held in the usual position to correct, will appear to have certain figures distinct, and others (at right angles) indistinct; for instance, figures XI and V may appear quite black, while figures II and VIII are grey and indistinct. If one of the principal meridians be emmetropic the astigmatism is simple; if both be hyperopic, or if both be myopic, it is compound; and if one meridian be hyperopic and the other myopic, it is styled mixed astigmatism. Generally the vertical meridian or one near it is the most convex, and this is called direct astigmatism (astigmatism "according to the rule"). If the horizontal is the most convex, the term oblique astigmatism is used (astigmatism "against the rule"). When the meridians are oblique, that is, about 45°, it is called oblique astigmatism. Low degrees of astigmatism of the (cornea) are corrected by the ciliary muscle, producing an astigmatism of the crystalline lens, the opposite of that of the cornea, and so neutralizing the defect. This work is done unconsciously, vision is generally quite good and no suspicion is entertained of anything wrong until some symptom of eye-strain shows itself (see Eye-strain, below), and the detection of it is one of the most important duties of the oculist. The only certain method of detecting and consequently correcting a low error of astigmatism, in all below the age of 50, is by paralyzing the ciliary muscle with atropine or homatropine and thus preventing it from correcting the defect, and revealing the true refraction of the eye. Astigmatism is corrected by cylindrical glasses combined with spherical convex or concave glasses if hyperopia or myopia co-exist, and the correction must be worn always in the form of rigid pince-nez or spectacles.

Presbyopia (Old Sight).—A normal-sighted child at the age of seven has his near point of accommodation 7 cms. from the eye, and as age advances this near point recedes gradually. At the age of 40 it has receded to 22 cms., in other words at this age fine print cannot be read nearer to the eye than 22 cms. Between the ages of 45 and 50 the person who has apparently enjoyed good sight up till then, both for distance and near, finds that by artificial light he cannot read the newspaper unless he holds it some distance from the eyes, and he has to give up consulting "Bradhaw" because he cannot distinguish between 3's and 8's. Another symptom often complained of is the blurring together of letters, so that the letters appear hazy, and the words rested beyond can be resumed. This loss of accommodation power is due to the gradual hardening of the crystalline lens from age, and convex glasses have to take its place, in order to make reading possible and comfortable. In hyperopia the presbyopic period is earlier, and in myopia it is later than normal (see above).

It is unwise for the presbyope to select the glasses for himself, as astigmatism or anisometropia may be present and must, of course, be corrected; the eyes should be properly tested, and this testing should be repeated every two or three years, as not only does the old sight increase, but changes in the static refraction of the eyes are probably taking place. When an error of refraction exists with the presbyope, glasses for distance, as well as reading, have to be worn, and to avoid the trouble.
of constantly changing, the two should be combined as bi-focal glasses. The upper portion of the bi-focal corrects the distant, and the lower the near vision, and in the best form the division between the two is invisible. When properly fitted these bi-focals prove the greatest boon to the presbyope.

Anisometropia (Odd Sight) is a condition in which the refraction of the two eyes is different. There are three varieties. (1) Binocular vision exists. As a rule a very small difference is present, and the difference is generally in the astigmatism; consequently eye-strain is very commonly manifested, and the correction by suitable glasses is imperative. (2) The eyes are used alternately. For instance, one eye may be hyperopic or emmetropic, and the other myopic; in such a case the former will be used for distant and the latter for near vision, and although binocular or stereoscopic vision is lost, glasses may never be required and any attempt at a correction may be useless. However, if eye-strain is present, the attempt should be made. (3) One of the eyes is permanently excluded. When the difference between the eyes is great the most defective eye is little used and tends to become amblyopic (partially blind), if it is not so already. This condition is very common in squint, and the treatment in such cases consists in providing the defective eye with its corrective glass, completely covering up the good eye and practising for certain periods every day, and thus forcing the defective eye to work. This eye may never take its share in binocular vision, but it may become very useful and especially if it does be or damage should affect the good eye; to the inception of the vision of the eye materially assists the treatment of the squint. When one eye is irre- mediably lost, the other should be very carefully tested, and if any error exists it ought to be corrected and the glass worn always.

Aphakia is the absence of the crystalline lens through dislocation, or removal by operation, or injury. A strong convex glass has to be worn in front of such an eye in order to obtain clear vision even for distance, and a still stronger one for near vision; after cataract operation astigmatism is generally pronounced at once. A convex glass must be combined with a cylinder: these glasses are best worn in the form of bi-focals (see Pref- byopia, above).

Eye-Strain.—Eye-strain is a symptom, or group of symptoms, produced by the correction, or attempt at correction, by the ciliary muscle of an error of refraction, or a want of balance between the external muscles of the eye (heterophoria). Where gross errors exist either in the refraction or in the muscular equili- brium, the correction cannot be made, and consequently no attempt is made to correct the defect, and eye-strain is not produced. The smaller the error the more likely is the eye-strain to be present, and also the more difficult is it to be overlooked. It is important to recognize what may be the different manifestations of eye-strain. They may be grouped under three headings: (1) manifestations on the eye and lids, such as conjunctivitis, blepharitis, iritis, cyclitis, glaucoma and cataract. (2) Peripheral irritation: (a) with pain: headaches and m引起; (b) without pain: epileptic attacks and choreiform movements of the facial muscles: vertigo, nausea, vomiting. (3) Nerve waste: nerve exhaustion, neurasthenia, brain-fat. This last form of eye-strain is as common as it is subtle, and is subtle because the sufferer never suspects the eyes to be at fault; all his waking hours he is unconsciously correcting a low degree of astigmatism, or anisometropia, or heterophoria, which means a constant nerve waste, and when he begins near work he starts with a big deficit, and further strain results.

Insomnia is a prominent symptom of eye-strain; this leads to depression, which in its turn may lead to the alcoholic or morphia habit. There is no form of functional nerve disorder that may not be caused by, or aggravated by, eye-strain.

The treatment of eye-strain consists in correcting all errors of refraction (and in the case of dioptric astigmatism, the more highly is even the smallest) and in wearing the correction always. A small amount of heterophoria will generally, in a short time, disappear when the error is corrected; if not, it must be corrected by prisms or decentring.

(E. C.)

VISITATION (Lat. from visitare, frequentative form of visere, to look at, to go to see, visit, videre, to see), an act of visiting, or going to see, a formal visit. The use of the word for an act of divine retributive justice, or generally of an occurrence of grave import, such as a plague or famine, is due mainly to Biblical phraseology, as in “the day of visitation” (Isa. x. 3). For the duty of bishops of the Roman Church to visit periodically the tombs of the apostles Peter and Paul at Rome, the Visitation Liminium Apostolorum, see Bishop. The specific application of the term is to a formal periodical visit paid by a superior authority to an institution or to a district for the purpose of investigation, examination or the like. There are three classes of such visitations: ecclesiastical, charitable and heraldic. Ecclesiastical visitations, originally the periodical journeys of personal inspection to ascertain the temporal and spiritual condition of each parish, form part of the functions of an archbishop, a bishop and an archdeacon. All charitable corporations are at law subject to visitation; the functions of the “visitors” have been largely taken over by the Board of Charity Commissioners. Colleges at a university are regarded in law as charitable institutions, and each college has a “visitor” whose duty it is to represent the founder and see that his wishes are carried out. Heraldic visitations were perambulations made by a king-at-arms or other high heraldic officer with a commission under the Great Seal to examine into pedigrees and claims to bear arms. The results of these visitations are entered in “Visitation Books,” which are in the nature of official records; their admissibility as evidence, though claimed, is judicially questioned as containing merely experts’ statements from the families to whom they refer (D’Arcy de Knayth Peerage Case, 1901). These heraldic visitations ceased about 1686.

In addition to these specific meanings may be mentioned the festival of the “Visitations of Mary,” in commemoration of the visit of the Virgin to Elizabeth, mother of St. John the Baptist, celebrated in the Roman, Greek and other churches on the 2nd of July, and the office of the English Church, the “Visitations of the Sick,” ordered for the spiritual comfort and benefit of sick persons.

For the international law relating to the right of belligerent vessels to “visit and search” neutral vessels in time of war, see Search, Right of.

VISITING CARDS. The use of cards of personal identification for social purposes is generally supposed to have had its origin at the court of Louis XIV. of France, that centre of the etiquette of the 17th century. But there appears to be little doubt that, in a rougher and ruder form, this mark of intercourse dates from much earlier times, and that the Chinese, and possibly other Oriental nations also, had in bygone ages employed some means of communication on calling at the houses of absent friends. When and where visiting cards first came into vogue in Europe is a matter of some uncertainty. It is probable, however, that they were first used in Germany—and as early as the 16th century. A German visiting card recently discovered in Venice bears this inscription: Johannes Westerholt Westphalus scribbat, Paavati, 4 Martii 15 x 60. Concerning this, Professor Dr Kirmis (Doehm, September 30th, 1905) remarks that the German students in Padua were wont, on quitting the university, to pay farewell calls at the houses of friends, and, in the event of not finding them within, to leave their names on paper billets; and he adds that the custom must, until that time, have been unknown in Italy, for this card of the student Westerholt was sent by Professor Giacomo Contarini on the 15th of January 1572 to Venice as a curiosity. Under the reign of Louis XIV., however, the fashion appears to have become firmly established in France. Small strips of paper were at first employed for the purpose of the communication; but gradually they attained a more elaborate finish and execution. Ladies especially seem to have been the pioneers in this direction, and charmingly embellished their visiting cards, some taking the form of "hearts" and other amorous tokens of affection. Under Louis XV., the reign of exquisitely extravagant
and refined taste, visiting cards were furnished with delicate engravings, frequently masterpieces of that art, showing some fanciful landscape, or a view of the town or place where the person resided. A further stage in the development of this custom was the autograph signature at the foot of the card beneath the engraved viuer. Europeans were followed in this fashion by the English, and the practice became universal in Europe towards the close of the 18th century. But though in almost every European country there are variations in the size and shape of the card and the way of describing the quality of the person whom it represents, the modern tendency is everywhere in favour of simplicity and the avoidance of ostentation.

A valuable collection of visiting cards is that of the Gabinetto della Stampe in Rome and the Museo Civico in Venice.

**VISOKO—VITEBSK**

Between the 13th and 16th centuries Visoko was only second to Jajce as a stronghold of the Bosnian rulers. There were fortified palaces at Stjateka, and Bobovac, which with most previous assaults, was betrayed to the Turks in 1463; at Stjateka there is a Franciscan monastery, founded in 1391, often razed by the Turks, and finally rebuilt in 1821. Just below Visoko lay the town of Podvisoko, called *Sotto Visochi* by the Ragusans, which was the chief mart of the country from 1348 to 1430.

**VISOR** (also spelled viser, vizor, vizard or visard), a term now used generally of the various forms of movable face-guards in the helmet of medieval and later times. It meant properly a mask for the face, and is an adaptation of the O.Fr. visitre, mod. visiere, as is seen by the M.E. forms visir, visere. It is thus to be referred to the Fr. vis, face, Lat. visum, from videre, to see. In this sense the word "visor" is modern, the movable guard for the upper part of the face being known as an "aventail" or "ventail," and that for the lower part a "beaver" (see HELMET).

**VISTULA** (Ger. Weichsel, Polish Wisła), one of the chief rivers of Europe, rising in Austria and flowing first through Russian and then through Prussian territory. Its source is in Austrian Silesia on the northern slopes of the West Beskiden range of the Carpathian mountains.

The stream runs through a mountain valley, in a N.W. direction to Schwarzwasser, where it leaves the mountains, turns E. and forms part of the Austro-German frontier (Galicia), it passes Cracow, and thereafter forms a long stretch of the frontier with Russia (Poland), bending gradually towards the north, until at Zawichost it runs due N. and enters Poland. The river winds between the two arms of the Pripyat, the left, and the right, which is formed by the Pripyat, and runs parallel with it, leaving this river in the north, and following the Pripyat as far as Mozyr, and thence to the Dvina. From Zawichost to the mouth, the Vistula is navigable by vessels of 500 tons, and as far as Warsaw by vessels of 2000 tons. The Vistula is navigable as far as Warsaw, and at the junction of the Bug and W. S. to pass Plock and Wloclawek (see further POLAND for its course within the territory). It enters Prussia 10 m. above Thorn, turns N.E. on receiving the Brate, passes Glandenz and turns towards the north. From this point it throws off numerous branches and sweeps from side to side of a broad valley, having steep banks on the side upon which it impinges, and on the other being bordered by extensive flat lands. Nearing the Bug, in which it forms a delta, dividing into two main arms, the left or western of which bears the name of Vistula, and flows directly to Danzig Bay, while the right is called the Nogat, and flows into the Frische Haff. The enclosed deltaic tract is very fertile. Parts of it are known as *Weder* (cf. the English "islands" or "holms" in the Fens and other low-lying tracts of the east). In the lower part of the delta the Haff Canal leads from the main river to the Frische Haff; there are also ample natural channels in that direction, but the main river passes towards the N.W., having a tendency to run parallel to the coast, and reaching Danzig Bay with a depth of 20 fathoms. Near Mozyr it forms an alluvial delta, called the Tserik, and there is a branch, the Framitz, which empties into the Brate.

The river broke a new channel into the bay, at a point between this cut and the old mouth at Neufahrwasser, on the night of the 1st-2nd of February 1830. The important seaport of Danzig, however, is on the old channel, and this channel is used by shipping which enters it by a canal at Neufahrwasser. The Nogat, formerly inaccessible, had become so much deepened and broadened by natural means in the early part of the 19th century that it could carry water than the Vistula itself (i.e. the other main deltaic branch). In 1845-57 the outflow of the Nogat was stopped and an artificial channel was formed for it, so as to restore the proper level of water to the Vistula.

The Nogat river and the lenses between it and the Vistula form a very important highway of commerce in Poland (p. 34) and Prussia. For small craft it is navigable above Cracow up to the Austro-German frontier, where the Schneidmilen enters it. This river and the Pilica, Bzura, Brah, Schwarzwasser and Ferr is the chief left-bank tributaries; on the right the Vistula receives the Skawa, Raba, Dunajec, Wisloda and Sun before reaching Poland, the Wieprz and Bug in Poland, and the Drenzw in Prussia. The Brzehe and the Bromberg Canal give access from the Vistula to the Netze and so to the Oder. The river is rich in fish. Its width is about 450 m., and its drainage area approaches 74,000 sq. m.

**VITALIANUS**, bishop of Rome from 657 to 672, succeeded Eugenius I. and was followed by Adeodatus. In the monothelite controversy then raging he acted with cautious reserve, refraining at least from express condemnation of the *Typus* of Constans II. The chief episode in his uneventful pontificate was the visit of Constans to Rome; the pope received him "almost with religious honour," a deference which he required by "an emperor," and all the nobility of the city to the 10th of March. The visit of the Vistula is considerable up to Cracow, and the river forms a very important highway of commerce in Poland (p. 34) and Prussia. For small craft it is navigable above Cracow up to the Austro-German frontier, where the Neufahrwasser enters it. This river and the Pilica, Bzura, Brah, Schwarzwasser and Ferr is the chief left-bank tributaries; on the right the Vistula receives the Skawa, Raba, Dunajec, Wisloda and Sun before reaching Poland, the Wieprz and Bug in Poland, and the Drenzw in Prussia. The Brzehe and the Bromberg Canal give access from the Vistula to the Netze and so to the Oder. The river is rich in fish. Its width is about 450 m., and its drainage area approaches 74,000 sq. m.

**VITELLUS** (Th. H. 52: 478-480), a soldier, sent to Britain by Augustus to put down the war of the Britons. He brought over one thousand soldiers, but was defeated by Ambrosius Aurelianus. He then crossed to Gaul, defeated Vercingetorix at Aquincum, and returned to Gaul in the next summer to subdue the tribes of the Lower Rhine. He was later sent to the Danubian frontier, where he died of a wound in the war against the Taurisci. He was a man of distinguished military ability and a lover of learning. He was the son of Publius Vitellius, who was governor of the province of Africa under Tiberius.

**VITEBSK**, a town of Russia, cap. of the government of the same name, on both banks of the W. Dvina, and on the railway from Smolensk to Riga, 85 m. N.W. from the former. Pop. (1888) 54,676; (1870) 65,871. It is an old town, with decaying mansions of the nobility, and dirty Jewish quarters, half of its habitants being Jews. There are two cathedrals, founded in 1664 and 1777 respectively. The church of St. Elias, a fine example of the Old Russian style of architecture, founded in 1643, was burned down in 1900. The manufactures are insignificant, and the poorer classes support themselves by gardening, boat-building and the flax trade, while the merchants carry on an active business with Riga in corn, flax, hemp, tobacco, sugar and timber.

Vitebsk (Dvbsk, Vitbeisk and Vitepsk) is mentioned for the first time in 1021, when it belonged to the Polotsk principality. Eighty years later it became the chief town of a separate...
principality, and so continued until 1230, when it fell under the
dominion of the Lithuanians. In the 16th century it fell to
Poland. Under the privileges granted to the city by the
Polish sovereigns it flourished, but it soon began to suffer from the
wars between Russia and Poland, during which it was
thrice taken by the Russians and burned. Russia annexed it
finally in 1772.

**VITELLI**—**VITERBO**

147

**VITELLOZZO (7-1502), Italian condottiere.**
Together with his father, Niccolò, tyrant of Città di Castello,
and his brothers, who were all soldiers of fortune, he instituted
a new type of infantry armed with arquebuses. Vitellozzo
served under Florence against Pisa, and later with the French in Apulia (1490) and
with the Orsini faction against Pope Alexander VI. In 1500
Vitellozzo and the Orsini made peace with the pope, and
the latter's son Cesare Borgia, being determined to crush the petty
 tyrants of Romagna and consolidate papal power in that
province, took the condottieri into his service. Vitellozzo
distinguished himself in many engagements, and in 1501 he
advanced against Florence, moved as much by a desire to avenge
his brother Paolo, who had been murdered on the road,
in the manner in which the republic had been
suspected of treachery and put to death (1499), as by
Cesare's orders. In fact, while the latter was actually negoti-
ating with the republic, Vitelli seized Arezzo. Forced by
Borgia and the French, much against his will, to give up the
city, he began from that moment to nurture hostile feelings
against his master and to aspire to independent rule. He took
part with the Orsini, Oliverotto da Fermo and other captains
in the conspiracy of La Magione against the Borgia; but
mutual distrust and the incapacity of the leaders before Cesare's
energy and the promise of French help, brought the plot to
naught, and neither Cesare nor Vitellozzo, hoping to ingratiate
themselves with Cesare once more, seized Senigallia in his name.
There they were decoyed by him and arrested while their
troops were out of reach, and Vitelli and Oliverotto were
strangled that same night (31st of December 1501).

See vol. iii. of E. Ricotti's _Storia della compagnie di ventura_ (Turin, 1843), in which Domenichi's MS. _Vita di Vitellozzo Vitelli_ is quoted; C. Yrarte, _Cesar Borgia_ (Paris, 1886); P. Villari, _Life and Times of N. Machiavelli_ (English ed., London, 1892); see also under _ALEXANDER VI._ and CESARE BORGIA.

**VITELLILUS, AULUS,** Roman emperor from the 2nd of
January to the 22nd of December A.D. 69, was born on the
24th of September A.D. 15. He was the son of Lucius Vitel-
lius, who had been consul and governor of Syria under Tiberius.
Aulus was consul in 48, and (perhaps in 60-61) proconsul of
Africa, in which capacity he is said to have acquainted himself
with credit. Under Galba, to the general astonishment, at the
end of 68 he was chosen to command the army of Lower
Germany, and here he made himself popular with his subaltens
and with the soldiers by outrageous prodigality and excessive
good nature, which soon proved fatal to order and discipline.
Far from being ambitious or scheming, he was lazy and self-
indulgent, fond of eating and drinking, and owed his elevation
to the throne to Caecina and Valens, commanders of two legions
on the Rhine. Through these two men a military revolution
was speedily accomplished, and early in 69 Vitellius was pro-
claimed emperor at Colonia Agrrippinensis (Cologne), or, more
accurately, emperor of the armies of Upper and Lower Ger-
many. In fact, he was never acknowledged as emperor by the
entire Roman world, though at Rome the senate accepted
him and decreed to him the usual imperial honours. He
advanced into Italy at the head of a licentious and ruffianly
soldiery, and Rome became the scene of riot and massacre,
gladiatorial shows and extravagant feasting. As soon as it
was known that the armies of the East, Dalmatia and Illyricum
had declared for Vespasian, Vitellius, deserted by many of his
adherents, would have resigned the title of emperor. It was
said that the terms of resignation had actually been agreed
upon with Primus, one of Vespasian's chief supporters, but
the praetorians refused to allow him to carry out the agreement,
and forced him to return to the palace, where he was on his way
to deposit the insignia of empire in the temple of Concord.
On the entrance of Vespasian's troops into Rome he was dragged
out of some miserable hiding-place, driven to the fatal Gemonian
stairs, and there struck down. "Yet I was once your emperor,"
were the last and, as far as we know, the noblest words of
Vitellius. During his brief administration Vitellius showed
indications of a desire to govern wisely, but he was completely
under the control of Valens and Caecina, who for their own
ends encouraged him in a course of vicious excesses which threw
him into the arms of the opposition.

Spooner's ed. of the _Histories of Tacitus_ (introduction); B. W. Henderson, _Civil War and Rebellion in the Roman Empire_, A.D. 69-70 (1908).

**VITERBO,** a city and episcopal see of the province of Rome,
Italy, 54 m. by rail N.N.W. of Rome, 1673 ft. above sea-level.
Pop. (1901) 17,544 (town), 21,258 (commune). It lies on the
old high road between Florence and Rome, and besides the
railway to Rome it has a branch line (25 m.) going N.E. to
Atina (see Dante, _La Divina Commedia_, Canto xvi.) and
picturesquely surrounded by luxuriant gardens, and enclosed
by walls and towers, which date partly from the Lombard
period. The streets are paved with large lava blocks, of which
the town is also built. It has many picturesque medieval
towers and other edifices (the Palazzo degli Alessandri is perhaps
the most interesting), for which indeed it is one of the best
towns in central Italy, and some elegant fountains; among
the latter may be mentioned the Fontana Fontana Grande (1279,
restored in 1424) and Fontana della Rocca by Vignola (1566).
The citadel (Roccia) itself, erected by Cardinal Albornoz in
1355, is now a barracks. The Palazzo Patrizi, a building of the
early Renaissance in the Florentine style. The cathedral,
a fine basilica, of the 13th (? century), with columns and fantastic
capitals of the period, originally flat-roofed and later vaulted,
with 16th-century restorations, contains the tomb of Pope
John XXI., and has a Gothic campanile in black and white
stone. It is more probable that it was S. Silvestro (now Chiesa
del Gesù) and not the cathedral that, in 1271, was the scene of
the murder, on the steps of the high altar, during public
worship, of Henry, son of Richard of Cornwall, by Guy de
Montfort (see Dante, _La Divina Commedia_, Canto xxxii.). In front of the cathedral, Pope Adrian IV. (Nicholas Breakspear) compelled the emperor
Frederick I. to hold his stirrup as his vassal. The old
episcopal palace with a double loggia built on to it (recently
restored to its original form) is a Gothic building of the 14th
century, in which numerous conclaves have been held.
The church of S. Rosa exhibits the embalmed body of that saint,
a native of Viterbo, who died in her eighteenth year, after
working various miracles and having distinguished herself by
her invectives against Frederick II. (1251), some ruins of whose
palace, destroyed after his death, exist. S. Francesco, a Gothic
church (before 1456), contains the fine Gothic tombs of Popes
Clement IV. and Adrian V., and has an external pulpit of the
15th century. The town also contains a few small Roman-
esque churches (S. Maria Nuova, S. Andrea, S. Giovanni in
Zoccoli, S. Sisto, &c.) and several other Gothic churches.
S. Maria della Cella is noteworthy among the former as having
one of the earliest campanili of any size in Italy (9th century).
The town hall, with a medieval tower and a 15th-century
portico, contains some Etruscan sarcophagi from sites in the
neighbourhood, and a few good paintings. At one corner of the
picturesque square in front of it is a Roman sarcophagus.
In the façade is a representation of the hunt of Meleager, with an inscrip-
tion in honour of the fair Galiana, to whom it is said, a
Roman noble laid siege to Viterbo in 1335. Close by is the
elegant Gothic façade of S. Maria della Salute, in white and
red marble with sculptures. The Gothic cloisters of S. Maria
della Verità just outside the town are strikingly beautiful.
The church contains frescoes by Lorenzo da Viterbo (1460) and
a fine majolica pavement. A mile and a half to the north-east
VITET—VITORIA

is the handsome early Renaissance pilgrimage church of the Madonna della Quercia; the façade is adorned with three lunettes by Andrea della Robbia. The fine wooden roof of the interior is by Antonio da Sangallo the younger (1510–23). The adjoining monastery has a pleasing cloistered court. A mile and a quarter farther is the town of Bagnaia, with the Villa Lante, still belonging to the family of that name, with fine fountains and beautiful trees, ascribed to Vignola. The inhabitants of Viterbo are chiefly dependent on agriculture, hemp is specially the district, and tobacco and various grains are largely grown, as well as the olive and the vine. There are in the vicinity numerous mineral springs; the warm sulphur spring of Bollicame, about 2 m. off, is alluded to by Dante (Inf. iv. 70).

Viterbo is by some identified with Surrina nova, which is only mentioned in inscriptions, while some place it at the sulphur springs, called the Bollicame, to the west of Viterbo on the line of the Via Cassia, where Roman remains exist. This might well be the site of the Roman town. Here the Via Cassia was joined by the Via Ciminia, passing east of the Locus Ciminus, while a road branched off to Ferentum. See E. Bormann in Corp. Inscr. Lat. xi. (Berlin, 1888), p. 454; H. Nissen, Italicische Landeskunde (Berlin, 1902), ii. 343. The fortresses of the Dominican Annio da Viterbo (d. 1502) were directed to prove that Viterbo was the site of the Fanum Voltumnae (see, however, Montefiascone). There are no archaeological remains in Viterbo itself, except a few courses of masonry under the bridge which connects the cathedral with the city, near the cathedral, possibly the pier of an older bridge. But the site is not unexpectedly considered to be ancient, and the name to be derived from Vetus urbs; tombs, too, have been found in the neighbourhood, and it is not an unlikely assumption that here, as elsewhere, the medieval town occupies the Etruscan site. It was fortified by the Lombard king Desiderius (the decree ascribed to him, now in the municipal palace, has long been recognized as a forgery of Annio). It is the centre of the territory of the "patrimony of Peter," which the countess Matilda of Tuscany gave to the papal see in the 12th century; in the 13th century it became a favourite papal residence. Popes Urban IV. (1261), Gregory X. (1271), John XXII. (1276), Nicholas III. (1277) and Martin IV. (1281) were elected here, and it was at Viterbo that Alexander IV. (1261), Clement IV. (1268), Adrian V. (1276) and John XXII. (1277) died. (T. As.)

VITET, LUDOVIC (1802–1873), French dramatist and politician, was born in Paris on the 18th of October 1802. He was educated at the École Normale. His politics were liberal, and he was a member of the society "Aide-loi, le ciel t'aidera." On the triumph of liberal principles in 1830 Guizot created an office especially for Vitet, who became inspector-general of historical monuments. In 1834 he entered the Chamber of Deputies, and two years later was made a member of the Council of State. He was consistent in his monarchist principles, and abstained from taking any part in politics during the second empire. The disasters of 1870–71 reawakened Vitet's interest in public affairs, and he published in the Revue des deux mondes his optimistic "Lettres sur le siège de Paris." He died in 1873.

Vitet was the author of some valuable works on the history of art, and his Monographie de l'Eglise Notre Dame de Noyon (1845) especially did much to awaken popular interest in architecture. In the early days of the Romantic movement he wrote some vivid dramatic sketches of the time of the League. They are: Les Barbares de Ligue (1844), La beste et les Esais (1827), and La Mort de Henri III. (1829), all three being published together in 1844 with the title of Le Ligue. The best of these is Les Esais de BilBo, in which the murder of the duke of Guise is described in the most convincing manner.

VITORIA, an episcopal city of northern Spain, and capital of the province of Álava; on the Miranda de Ebro-Álava section of the Northern railways, among the southern outliers of the Cantabrian mountains, and on the left bank of the river Zadorra, a left-hand tributary of the Ebro. Pop. (1900) 30,701. The city is built on a hill 1750 ft. high, and overlooks the plain of Álava. Its oldest part, the Campillo or Villa-Suso, occupies the top of the hill; some of the walls and towers by which it was formerly defended still remain. Below it is Vitoria Antigua, with narrow tortuous lanes; on the still lower level ground is the modern town, with wide streets, an arcade market-place and shady promenades. The cathedral of Santa María in the Campillo dates from 1581, but has been considerably spoiled by late additions; the church of San Miguel also dates from the 16th century; it has an exceptionally beautiful 16th century wood by J. Velázquez and G. Hernandez, in the 16th century. The town hall and the palace of the provincial assembly contain some fine paintings and interesting relics connected with the history of Álava. Vitoria, from its favourable position on the main lines from Madrid to France and to the port of San Sebastián, is an important centre of trade in wine, wool, horses, mules and hardware; other industries are paper-making, carriage-building, cabinet-making, tanning and the manufacture of earthenware. There is a branch railway from Vitoria to Villarreal. The city is lighted by electricity; its trade and population have largely increased since 1875.

Vitoria was founded in 581 by Leovigild, king of the Visigoths; but its importance dates from the 10th century. In 1181 Sancho the Wise of Navarre granted it a charter and fortified it.

Battle of Vitoria.—For the operations which preceded the battle of Vitoria see PENINSULAR WAR. On June 21st, 1833, the French army in Spain (about 65,000 men with 150 guns), under King Joseph Bonaparte, held an extended position in the basin of Vitoria, south (with the exception of the extreme right) of the river Zadorra. The left rested on the heights of Puebla, north of the Puebla Pass, and Puebla de Argazkon, through which ran the Miranda-Vitoria-Bayonne road, Joseph's line of communication with France. Thence the line stretched to the ridge of Margarita, the troops so far being under General Gazan, with a second supporting line under D'Erlon between Ariné and Hermandad and a reserve behind Ariné. The right under Reille guarded the Bilbao-Vitoria road, occupying heights on the north bank of the Zadorra, and also the villages and bridges of Abechuco and Gamarra Mayor, as well as a ridge near Ariga on the south bank. There were no troops between Hermandad and Ariaiga, except a mass of cavalry near Ali. The Zadorra, fordable in certain spots only, was spanned by bridges at Puebla de Argazkon, Nanclares, Villodas, Tres Puentes, Mendoza, Abechuco and Gamarra Mayor, which French guns commanded; but, for some reason, none of these had been destroyed. The faults of the French position and their occupation of it were its extension; that it was in prolongation of and (on the right especially) very close to their line of retreat, so that if the right were driven back this line could be at once seized; that the centre was not strongly held; and that all bridges were left intact.

The Allies (nearly 80,000, with 90 guns), under Wellington, had moved from the river Bayas at daylight to attack Joseph, in four columns, the right being under Hill (20,000, including Morillos's Spaniards), the right centre and left centre under Wellington (30,000) and the left under Graham (20,000, including Longa's Spaniards). As the columns marched across the intersected country between the Bayas and Zadorra, extending from near Puebla de Argazkon to the Bilbao-Vitoria road, they kept touch with each other; and as they neared the Zadorra the battle opened all along the line soon after 10 a.m. Wellington's instructions to Graham were to undertake no manoeuvre which would separate his column from those on the right; but, with this proviso, to seize the Vitoria-Bayonne road if the enemy appeared decided in retreat. Hill after a sharp contest gained the Puebla heights, too weakly held; and pushing through the pass carried the village of Subijana de Álava. The right centre column having reached Villodas, was waiting for Hill to gain further ground, when the bridge at Tres Puentes was observed to be threatened. Joseph, however, had crossed the river commanded from the south bank; and, the French attention being now turned towards their flanks, it was surprised and rushed by Wellington with the
Light division, supported quickly by cavalry and other troops, who maintained themselves on the south bank. Joseph's centre was partially forced, while his left was hard pressed by Hill; and, fearing that Gazan and D'Erlon might be cut off from Reille, he ordered them to withdraw to a ridge farther back, which they did, holding Arinex in front. Here there was no hard fighting; but, as Wellington had now passed three divisions, many guns and the cavalry (which, however, from the nature of the ground could be but little used) across the Zarossa, Margarita, Hermandad and Arinex soon fell to the Allies.

On the left, Graham, having turned the heights north of Zarossa with Longa's Spaniards, seized Gamarra Menor close to the Bayonne road. He also with heavy loss carried Gamarra Mayor and Abechucu, but the bridges south of these villages, though more than once taken, were always recaptured by Reille. At length, when a brigade from the Allied centre had been pushed up from Hermandad against Reille's flank, he withdrew from the obstinately defended bridges, and before this Gazan and D'Erlon had also fallen back, fighting, to a third position on a ridge between Armentia and Ali west of Vitoria. Here, at about 6 p.m., they made a stand, being compelled in the end to yield; and as Graham having now crossed the bridges was close to the Bayonne road, the main body of Joseph's army fled by a bad cross road towards Pamplona, abandoning a library, vehicles and baggage (of which an enormous quantity was parked near Vitoria), Reille afterwards joining it through Betonia. The Allies then occupied Vitoria and pursued the French until nightfall. All Joseph's equipages, ammunition and stores, 143 guns, a million sterling in money, and various trophies fell into Wellington's hands. The French loss in men being nearly 7000, that of the Allies over 5000, of whom 1600 were Portuguese and Spaniards. This decisive victory practically freed Spain from French domination.

VITRÉ, a town of north-western France, capital of an arrondissement in the department of Ille-et-Vilaine, situated on a hill rising from the left bank of the Vilaine, 24 m. E. of Rennes by rail. Pop. (1906) town, 7106; commune, 10,092. The town largely retains its feudal aspect. The ramparts on the north side and on the west, consisting of a machicolated wall with towers at intervals, are still standing. Only one gateway remains of the original castle, founded towards the end of the 11th century; the rest was rebuilt in the 14th and 15th centuries (the best period of Breton military architecture) and restored in recent times. It is now occupied by a prison, a museum of natural history and painting and the town library. The church of Notre-Dame, formerly a priory of the abbey of St Méline of Rennes, dates from the 15th and 16th centuries. An outside stone pulpit is a fine example of 16th-century sculpture. The church possesses a fine enamelled triptych of the 16th century. A tower of the 16th century is all that remains of the church of St Martin. The château de Les Rochers 3 m. from Vitré was the residence of Madame de Sévigné.

Vitré was formerly a Breton barony, and belonged in the 10th century to the younger branch of the counts of Rennes. In 1205 it passed to Guy IX., baron of Laval, on his marriage with the heiress, and afterwards successively belonged to the families of Rieux, Colligny and La Trémouille. The town was seized by Charles VIII. in 1488. Protestantism spread under the rule of the houses of Rieux and Colligny; Vitré became a Huguenot stronghold; and a Protestant church was established, which was not suppressed till the revocation of the edict of Nantes in 1685. Philip Emmanuel, duke of Mercour, the head of the members of the League in Brittany, besieged the town a few times in 1568. The parties of Bergé, over which the barons of Vitré and of Léon alternately presided, met here several times.

VITRIFIED FORTS, the name given to certain rude stone enclosures whose walls have been subjected in a greater or less degree to the action of fire. They are generally situated on hills offering strong defensive positions. Their form seems to have been determined by the contour of the flat summits which they enclose. The walls vary in size, a few being upwards of 12 ft. high, and are so broad that they present the appearance of embattled camps. Weak parts of the defence are strengthened by double or triple walls, and occasionally vast lines of ramparts, composed of large blocks of unheated and unvitrified stones, envelop the vitrified centre at some distance from it. No lime or cement has been found in any of these structures, all of them presenting the peculiarity of being more or less consolidated by the fusion of the rocks of which they are built. This fusion, which has been caused by the application of intense heat, is not equally complete in the various forts, or even in the walls of the same fort. In some cases the stones are only partially melted and calcined; in others their adjoining edges are only fused so that they are firmly cemented together; in many instances pieces of rock are enveloped in a glassy enamelled coating which binds them into a uniform whole; and at times, though rarely, the entire length of the wall presents one solid mass of vitreous substance.

Since John Williams—one of the earliest of British geologists, and author of The Mineral Kingdom—first described these singular ruins in 1777, about fifty examples have been discovered in Scotland. The most remarkable are Dun Mac Uisneachain (Dun Maccnoichan), the ancient Beregumon, an area of 1000 m. N.N.E. of Ohan; Tap o' Noth, in Aberdeenshire; Craig Phadraic, or Phadrick, near Inverness; Dun Dhardhail (Dunjardil) in Glen Nevis; Knockfarrae, near Strathpeffer; Dun Creich, in Sutherland; Finhaven, near Aberlemno; Barryhill, in Perthshire; Lawls, near Dundee; Dun Gall and Burt Island, in Buteshire; Anwoth, in Kirkcudbright; and Cowdenknowes, in Berwickshire. Dun Mac Uisneachain is the largest in area, being 250 yds. long by 50 yds. broad. In the Tap o' Noth the walls are about 8 ft. high and between 20 and 30 ft. thick. In Dun Mac Uisneachain, Barryhill and Lawls the remains of small rectangular dwellings have been found. For a long time it was supposed that these forts were peculiar to Scotland; but they are found also in Londonderry and Cavan, in Ireland; in Upper Lusatia, Bohemia, Silesia, Saxony and Thuringia; in the provinces of the Rhine, especially in the neighbourhood of the Nahe; in the Ucker Lake, in Brandenburg, where the walls are formed of burnt and smelted bricks; in Hungary; and in several places in France, such as Châteauvieux, Peran, La Courbe, Sainte Suzanne, Puy de Gaudy and Thauron. They have not been found in England or Wales.

In some continental forts the vitrified walls are supported by masses of unvitrified stone built up on each side. This,
in all probability, constituted an essential feature in the Scottish forts. Except on the hypothesis of buttresses of a similar kind, it is impossible to explain the vast quantities of loose stones which are found both inside and outside many of the vitrified walls.

The method by which the fusion of such extensive fortifications was produced has excited much conjecture. Williams maintained that the builders found out, either during the process of smelting bog-ore, or whilst offering sacrifices, the power of fire in vitrifying stone, and that they used this method to cement the stones together in the defences. This view has been keenly controverted, and it has been suggested that the vitrified summits were not forts but the craters of extinct volcanoes, an hypothesis long since abandoned; that they are not so much forts as vitrified sites, and that the vitreousness was produced by fires lighted during times of invasion, or in religious celebrations; and, lastly, that if they were forts they must originally have been built of wood and stone, and that their present appearance is due to their being set on fire by a besieging enemy. The theory of Williams has, with modifications, been accepted by the principal authorities. It is supported by the following facts:

(1) The idea of strengthening walls by means of fire is not singular, or confined to a distinct race or area, as is proved by the burnt-earth enclosure of Azatalan, in Wisconsin, and the vitrified stone-mounds of the Mississippi valley. (2) Many of the Primary rocks, particularly the schists, gneisses and traps, which contain large quantities of potash and soda, can be readily fused in the open air by means of wood fires—the alkali of the wood serving in some measure as a flux. (3) The walls are chiefly vitrified at the weakest points, the naturally inaccessible parts being unvitrified. (4) When the forts have been placed on materials practically insubstantial, as the quartzite conglomerates of the Red Sandstone, as at Craig Phadhair, and on the limestones of Dun Mac Uisneachain, pieces of fusible rocks have been selected and carried to the top from a considerable distance. (5) The vitrified walls of the Scottish forts are invariably formed on a bed which could be easily acted upon by fire, whereas the outer ramparts, which are not vitrified, are built of large blocks. (6) Many of the continental forts are so constructed that the fire must have been applied internally, and at the time when the structure was being erected. (7) Daubrée, in an analysis which he made on vitrified materials taken from four French forts, and which he submitted to the Academy of Paris in 1881, found the presence of nautton in such great abundance that he inferred that sea-salt was used to facilitate fusion. (8) In Scandinavia, where there are hundreds of ordinary forts, and where for centuries a system of signal fires was enforced by law, no trace of vitrifaction has yet been detected.

A great antiquity has been assigned to vitrified forts, without sufficient proof. Articles of bronze and iron have been found in the Scottish forts, while in Puy de Gaudry a Roman tile has been discovered soldered to a piece of vitrified rock. In a few of the German forts Professor Virchow found some of the logs used as fuel in vitrifying the walls, and he concluded from the evenness of their cut surfaces that iron and stone implements must have been used. These results indicate that these structures were possibly in use as late as the early centuries of the Christian era. It has been suggested that they were built as refuges against the Norsemen. Much in the situation and character of the forts favours this supposition. This is especially the case with reference to the Scottish forts. Here the vitrified summits are invariably so selected that they not only command what were the favourite landing-places of the Vikings, but are the best natural defences against attacks made from the direction of the seacoast. In Saxony and Lusatia the forts are known as Schwenkburgs, and in the Highlands of Scotland as the fortresses of the Picts—designations which also seem to point to an original dating back to the times of the Vikings.

VITRIOL, a name given to sulphuric acid and to certain sulphates. Oil of vitriol is concentrated sulphuric acid. Blue or Roman vitriol is copper sulphate; green vitriol, ferrous sulphate (coppers); white vitriol, zinc sulphate; and vitriol of Mars is a basic iron sulphate.

VITRUVIUS (MARCUS VITRUVIUS POLLIO), Roman architect and engineer, author of a celebrated work on architecture. Nothing is known concerning him except what can be gathered from his own writings. Owing to the discovery of inscriptions relating to the Genia Vitruvia Formiae in Campania (Mola di Gaeta), it has been suggested that he was a native of that city, and that Vitruvius had been intimately connected with Verona on the strength of an existing arch of the 3rd century, erected with the name of a later architect of the same family name—"Lucius Vitruvius Cerdo, a freedman of Lucius." From Vitruvius himself we learn that he was appointed, in the reign of Augustus, together with three others, a superintendent of balistas and other military engines, a post which, he says, he owed to the friendly influence of the emperor's sister, probably Octavia (De Archit., i. pref.). In another passage (v. 1) he describes a basilica and adjacent aedes Augusti, of which he was the architect. From viii. 3 it has been supposed that he had served in Africa in the time of Julius Caesar, probably as a military engineer, but the words hardly bear this interpretation. He speaks of himself as being low in stature, and at the time of his writing bowed down by age and ill-health (ii. pref.). He appears to have enjoyed no great reputation as an architect, and, with philosophic contentment, records that he possessed but little fortune. Though a great student of Greek philosophy and science, he was unpractised in literature, and his style is very involved and obscure. To a great extent the theoretical and historical parts of his work are compiled from earlier Greek authors, of whom he gives a list at i. 1 and viii. 3. The practical portions, on the contrary, are evidently the result of his own professional experience, and are written with much sagacity, and in a far clearer style than the more pedantic chapters, in which he gives the somewhat fanciful theories of the Greeks. Some sections of the latter, especially those on the connexion between music and architecture, the scale of harmonic proportions, and the Greek use of bronze vases to reverberate and strengthen the actors' voices in the theatre, are now almost wholly unintelligible. Vitruvius's name is mentioned by Pliny in his work on the aqueducts of Rome; and most of what Pliny says (Hist. Nat. xxxv. and xxxvi.) about methods of wall-painting, the preparation of the stucco surface, and other practical details in building is taken almost word for word from Vitruvius, especially from vi. 1, though without any acknowledgment of the source.

The treatise De Architettura Libri Decem is dedicated to Augustus. Lost for a long time, it was rediscovered in the 19th century at St Gall; the oldest existing MS. dates from the 10th century. From the early Renaissance down to a comparatively recent time the influence of this treatise has been remarkably great. Throughout the period of the classical revival
VITRUY-LE-FRANÇOIS—VITTORIA

Vitruvius was the chief authority studied by architects, and in every point his precepts were accepted as final. In some cases a failure to understand his meaning led to curious results; for example, the medieval custom, not uncommon in England, of placing rows of earthenware jars under the floor of the stalls in church choirs, appears to have been an attempt to follow out suggestions raised by Vitruvius as to the advantages of placing bronze vases round the auditorium of theatres. Bramante, Michelangelo, Palladio, Vignola, and other architects, careful students of the work of Vitruvius, which through them has largely influenced the architecture of almost all European countries.

Bk. i. opens with a dedication to Augustus. C. 1 is on the science of architecture generally, and the branches of knowledge with which the trained architect ought to be acquainted, viz. grammar, music, painting, sculpture, some different aspects of geometry, optics; c. 2 is on the general principles of architectural design; c. 3 on the considerations which determine a design, such as strength, utility, beauty; c. 4 on the nature of different sorts of ground for the construction of houses in wood, stone, marble, brick, concrete and marble, and on the materials for stucco; c. 9 on timber, time for felling it, seasoning, &c.; and c. 10 on the irrigation of gardens.

Bk. ii. relates to materials (preface about Dinocrates, architect to Alexander). There are several great cities in the north-eastern parts of the world; c. 3 of black marbles, c. 4 of the earliest dwellings of man; c. 2 on systems of Thales, Heraclitus, Democritus, &c.; c. 3 on bricks; c. 4 on sand; c. 5 on lime; c. 6 on pozzolana; c. 7 on kinds of stones, c. 8 on foundations, stone pavement, brick, concrete and marble, and on the materials for stucco; c. 9 on timber, time for felling it, seasoning, &c.; and c. 10 on the foundations of buildings.

Bk. iv. on styles and orders, has a preface about Augustus on the scope of the work. The subjects of the first chapters are—(4) the Corinthian, Ionic and Doric orders; (2) the ornaments of capitals, &c.; (2) the Doric order; (4) proportions of the cells and pronos; (8) orders of temples; (9) walls of temples, in the Etruscan or Tuscan order of temples; (8) circular temples; &c.

Bk. v. on public buildings, has a preface on the theories of Pythagoras &c. Its twelve chapters treat—(1) on fora and basilicas, with description of his own basilica at Fanum; (2) of the adjuncts of a forum (aerarium, prison and curia); (3) of their sites, their site and construction; (4) of laws of harmonics; (5) of the arrangement of the parts of the theatre (theatrical purposes); (6) of Roman theatres; (7) of Greek theatres; (8) of the selection of sites of theatres according to acoustical principles; (9) of porticus and covered walks; (10) of the sites of the baths, the foundations of various parts; (11) of palaestrae, stadii and Greek buildings for the exercise of athletics; (12) of harbours and quays.

Bk. vi. is on sites and planning, and the preface treats of various Greek authors. C. 1 is on selection of sites; c. 2 on the planning of buildings to suit different sites; c. 3 on private houses, their construction and styles, the names of the different rooms; c. 4 on foundations and cellars; c. 5 on buildings fitted for special purposes; c. 6 on farms and country houses; c. 7 on Greek houses and the names of various parts; c. 8 on construction of halls and monasteries; c. 9 on mosaics and mosaic floors; c. 2 is on white stucco for walls (opus albium); c. 3 on concrete vaults, gypsum mouldings, stucco prepared for painting; c. 4 on painting; c. 5 on the building of hollow walls to keep out the damp, wall decoration by various processes; c. 6 on methods and styles of wall painting, the debased taste of his time; c. 6 on fine stucco made of pounded marble—three costs to receive wall paintings; c. 7 on colours used for mural decoration; c. 8 on lead (minium) and mercury, and how to use the latter to extract the gold from worn-out pieces of stuff or embroidery; c. 9 on the preparation of red lead and the method of encaustic painting, with hot wax and oil, &c.; (9) on various kinds of sundials and their inventors.

Bk. ix. is on astronomy. The preface treats of Greek sciences, geonics, &c. The discovery of specific gravity by Archimedes, and other discoveries of the Greeks, and of Romans of his time who have wied with the Greeks—Lucertius in his poem De Kerum Natura, Cicero in rhetoric, and Varro in philology, &c. The subjects of the eighteen chapters are—(1) the signs of the zodiac and the seven planets; (2) the phases of the moon; (3) the passage of the sun through the zodiac; (4) and (5) various meteorological phenomena; (6) the relation of astrological influences to nature; (7) the mathematical divisions of the gnomon; (8) various kinds of sundials and their inventors.

Bk. x. is on machinery, with a preface concerning a law at ancient Ephesus compelling an architect to complete any public building he had undertaken; this, he says, would be useful among the Romans of his time. The chapters are—(1) on various machines, such as scaling ladders, winches, &c.; (2) on windlasses, axles, pulleys and cranes for moving heavy weights, such as those used by Chersphon in building the great temple of Diana at Ephesus, and on the discovery by a shepherd of a quarry of marble required to build the temple of the same temple at Ephesus; (3) on water-raising by a revolving spiral tube; (7) on the machine of Ctesibius for raising water to a height; (8) on gourds for irrigation, the devices for raising water by gourds, &c.; (9) on the mathematical subject of the attack of a fortress; (14) on the form of the gourds used for irrigation, and the various points of use in ancient times.

The best edition is by Rosé (2nd ed., Leipzig, 1889); see also Nohl, Index Vitruei (1876); Jolles, Vitruvus Architectus (1896). There is a good translation by Gwilt (1826; reprinted, 1874).

The name of Vitrueius has been given to several works of modern architecture, such as Campbell, Vitrueius Britannicus; London, 1715-71, of the buildings of the 8th century in England, including many works of the brothers Adam; one of these brothers, William Adam, produced a similar work illustrating the buildings which he has designed for Scotland, under the title of Vitrueius Scotiæ (Edinburgh, 1790). Thurah, Le Vitrueius danois (Copenhagen, 1749-50), is a similar collection of modern buildings in Denmark.

VITRY-LE-FRANÇOIS, a town of north-eastern France, capital of the department of the Marne, on the right bank of the Meuse, 20 m. S.E. of Châlons, on the Châlons to Paris road. Pop. (1906) 15,857. The Marne-Rhine canal, the Haute-Marne canal, and the canal of the Marne unite at Vitry. Its church of Notre-Dame is a 17th-century building with fine 18th-century monuments. A convent of the Récollets now contains the town hall, the court-house, a library and a small museum. There is a bronze statue of P. P. Royer-Collard (1763-1845), the politician and philosopher, a native of the district. The industrial establishments include important cement works and the manufacture of faience is carried on. The present town was built in 1545 on a uniform plan by Francis I. to replace the older town which was destroyed by fire in 1544. It was incorporated in the previous year by Charles V.

VITTEL, a watering-place of north-eastern France, in the department of Vosges, 31 m. W. of Epinal by rail. Pop. (1906) 15,694. The waters resemble those of Contrexéville, but are lighter in character; they are bottled and exported in large quantities. They are prescribed in cases of gravel, gout, &c. Vittel has been considerably developed in recent years, and is well supplied with hotels, a fine casino and park, &c.

VITTORIA, a town of Sicily in the province of Syracuse, 95 m. S.W. of Syracuse, being half way to Palermo, founded in 1605 by Giovanni Aliphonso Henriquez, who named it after his mother, the famous Vittoria Colonna. It is a prosperous town.

1 The excavations made in 1887 have shown that Vitrueius was right in describing the great temple of Olympian Zeus at Athens as being octastyle. The previously almost universal opinion that it was decastyle had led to the needless theory that the passage containing this statement was corrupt.

2 Vitrueius names Cicero and Lucretius as post nostram memoriam nascere. The architect being at that time also the contractor.
VITTORIO, a town and episcopal residence of the province of Treviso, Venetia, Italy, 25 m. by rail N. of Treviso, 466 ft. above sea-level. Pop. (1901) 2977 (town), 19,133 (commune).

It is a summer resort, with sulphur and saline springs (51°8′ to 59° F.), and was formed in 1879 by the union of Ceneda (the episcopalsee) and the town of Caen, which was increased by the Pompomam Amatella (a pupil of Pordenone) and others. At Serravalle is a church with a fine altar-piece (1547) by Titian. It is a seat of the silkworm breeding and silk-throwing industries.

VITUS, ST (German, Vint; French, Guy). According to the legend, where he is associated with Modestus and Crescendia, by whom he had been brought up, St Vitus suffered martyrdom at a very early age under the emperor Diocletian. Son of a Sicilian nobleman who was a worshipper of idols, Vitus was converted to the Christian faith without the knowledge of his father, and was denounced by him and scourged, but resisted all attacks on his profession. Abandoned by an angel, he crossed the sea to Lucania and went to Rome, where he suffered martyrdom. His festival is celebrated on the 15th of June. The Passion of St Vitus has no historical value, but his name occurs in the Martyrologium hieronymianum. In 366 the abbey of Corvey, in Saxony, received his relics, and became a very active centre of his cult. In the second half of the 9th century the monks of Corvey, according to Helmiold's Chronica Slavorum, evangelized the island of Rügen, where they built a church in honour of St Vitus. The island has been abandoned, but they kept up a shrine of the saint of the (whom they called the god), returning to Christianity three centuries later. At Prague, too, there are some relics of the saint, who is the patron of Bohemia and also of Saxony, and one of the fourteen "protectors" (Nothelfer) of the church in Germany. Among the diseases against which St Vitus is invoked is chorea, also known as St Vitus's Dance.

VIVALDO, UGOLINO and SORLEONE DE (fl. 1291-1315), Genoese explorers, connected with the first known expedition in search of an ocean way from Europe to India. UgoUgino, with his brother Guido or Vatuno Vivaldo, was in command of this expedition of two galleys, which he had organized in conjunction with Tadisio Doria, and which left Genoa in May 1291 with the purpose of going to India "by the Ocean Sea" and bringing back useful things for trade. Planned primarily for commerce, the enterprise also aimed at proselytism. Two Franciscan friars accompanied Ugolino. The galleys were well armed and sailed down the Moroccan coast to a place called Gzora (Cape Nub), in 28° 47′ N., after which nothing more was heard of them. Early in the next (14th) century, Sorleone de Vivaldo, son of Ugolino, undertook a series of distant wanderings in search of his father, and even penetrated, it is said, to Magadzo on the Somali coast. In 1455 another Genoese seaman, Antonio Uso di Mare, sailing with Cadamosto in the service of Prince Henry the Navigator of Portugal, claimed to have met, near the mouth of the Gambia, with the last descendant of the survivors of the Vivaldo expedition. The two galleys, he told, had sailed to the Sea of Guinea; in that sea one was stranded, but the other passed on to a place on the coast of Ethiopia-Mena or Amenuan, near the Gibon (Gambia) where the Seemians, where the Genoese were seized and held in close captivity.

VIVARINI, the surname of a family of painters of Murano (Venice), who produced a great quantity of work in Venice and Crete. The first in the 13th century, leading on to that school which is represented by Carpaccio and the Bellinis.

Antonio Vivarini (Antonio di Murano) was probably the earliest of this family. He came from the school of Andrea da Murano, and his works show the influence of Gentile da Fabriano. The earliest known date of a picture of his, an altar-piece in the Venetian academy, is 1440; the latest, in the Lateran museum, 1464, but he appears to have been alive in 1470. He worked in company with a certain "Joannes de Alemanis," who has been (with considerable doubt) regarded as a brother (Giovanni of Murano), but no trace of this painter exists of a date later than 1447. After 1447 Antonio painted either alone or in combination with his younger brother Bartolomeo. The works of Antonio are well drawn for their epoch, with a certain noticeable degree of softness, and with good flesh and other tints. Three of his principal paintings are the "Virgin Enthroned with the Four Doctors of the Church," the "Coronation of the Virgin," and "Sts Peter and Jerome." The first two (in which Giovanni co-operated) are in the Venetian academy, the third in the National Gallery, London. This gallery contains also specimens of the two under-named painters.

Bartolomeo Vivarini is known to have been active in Crete from 1450 to 1490. He learned oil-painting from Antonello da Messina, and is said to have produced, in 1473, the first oil picture done in Venice. This is in the church of S. Giovanni e Paolo—a large altar-piece in nine divisions, representing Augustine and other saints. Most of his works, however, including one in the National Gallery, are in tempera. His outline is always hard, and his colour good; the figures have much dignified and devout expression. As "vivarino" means in Italian a goldfinch, he sometimes drew a goldfinch as the signature of his picture.

Luigi or Alvise Vivarini, born about 1446, painted in 1475 and on to 1502, when he died. It has sometimes been supposed that, besides the Luigi who was the latest of this pictorial family, there had also been another Luigi who was the earliest, this supposition being founded on the fact that one picture is signed with the name, with the date 1414. There is good ground, however, for considering this date to be a forgery of a later time. The works of Luigi show an advance on those of his predecessors, and some of them are productions of high importance. One of the most important is the picture of S. Girolamo in Venice, representing the saint caressing his lion, and some monks decamping in terror. The architecture and perspective in this work are superior. Other works by Luigi are in Treviso and in Milan. He painted some remarkable portraits.

(W. M. R.)

VIVERO, a town of north-western Spain, in the province of Lugo, on the Ria de Vivero, an estuary formed by the river Landrove, which here enters the Bay of Biscay. Pop. (1900) 12,843. Vivero is an old-fashioned and picturesque town, connected with the opposite bank of the estuary by a bridge of twelve arches and a causeway. Its fishing fleet, its coasting trade and the agricultural products of the fertile country around are important. The only means of communication with the interior is by the road to Cabeceiras, for Lugo and Ferrol.

VIVES, JUAN LUIS (1412-1494), Spanish scholar, was born at Valencia on the 6th of March 1492. He studied at Paris from 1509 to 1512, and in 1519 was appointed professor of humanities at Louvain. At the instance of his friend Erasmus he prepared an elaborate commentary on Augustine's De Civitate Dei, which was published in 1522 with a dedication to Henry VIII. Soon afterwards he was invited to England, and is said to have acted as tutor to the princess Mary, for whose use he wrote De ratione studii puérilis epistolae duo.
VIVIAN, 1st Baron—VIVISECTION

(1523). While in England he resided at Corpus Christi College, Oxford, where he was made doctor of laws and lectured on philosophy. Having declared himself against the king's divorce from Catherine of Aragon, he lost the royal favour and was confined to his house for six weeks. On his release he withdrew to Bruges, where he took part in the action of Cape de Passos against English forces, chiefly directed against the scholastic philosophy and the preponderant authority of Aristotle. The most important of his treatises is the *De Caussis corruptorum Arilium*, which has been ranked with Bacon's *Organon*. He died at Bruges on the 6th of May 1540.

VIVIAN, RICHARD HUSSEY VIVIAN, 1st Baron (1775-1842), British cavalry leader, came of a Cornish family. Educated at Harrow and Exeter College, Oxford, Vivian entered the army as a volunteer and became captain in the 28th foot in 1798. Under Lord Moira he served in the campaign of 1794 in Flanders and Holland. At the end of the expedition, the 28th bore a distinguished part in Lord Cathcart's action of Gueldernsmen. In 1798 Vivian was transferred to the 7th Light Dragoons (now Hussars), and in Sir Ralph Abercomby's division was present at the battles of Bergen and Alkmaar (19th September to 6th October 1799). In 1800 he received his majority, and in 1804 he became lieut.-colonel of the 7th. In command of this regiment he sailed to join Baird at Corunna in 1808, and took part in Lord Paget's cavalry fights at Sahagun and Benavente. During the retreat of Moore's army the 7th were constantly employed with the rearguard. Vivian was present at Corunna, and returned with the remainder of the army to England. It was not until late in 1813 that the 7th returned to the Peninsula, and Vivian (now colonel and A.D.C. to the prince regent) was soon taken away to command a cavalry brigade under Hill. With this corps he served throughout the fighting on the Nive (9th-13th December). At the beginning of 1814 he was transferred to a cavalry brigade of Beresford's corps, and took a marked part in the operations at Pau and the battle of Orthes. In the advance on Toulouse Vivian fought a brilliant action at Crois d'Orade on the Ers (8th April), when he was very severely wounded. At the beginning of 1815 he was made K.C.B.; he had been a major-general for several months. In April Sir Hussey Vivian was appointed to command a brigade of Uxbridge's cavalry, and at Waterloo his regiments, with those of Vandeleur's brigade, made the final charge of the day between Hougomont and La Haye Sainte, sweeping everything before them. This service was rewarded by the thanks of both houses of parliament, the K.C.H. and the orders of Maria Theresa and St Vladimir, from the emperors of Austria and Russia. He sat in the House of Commons as member for Truro from 1821 to 1831; he was then made commander of the forces in Ireland, and given the G.C.H. In 1835 he became master-general of the ordnance. In 1837 he received the G.C.B., and in 1841, being then M.P. for East Cornwall, was created Baron Vivian in the English peerage. A year later he died at Baden-Baden. He was twice married (first in 1804), and the title descended in the direct line of his natural son, Sir Robert John Hussey Vivian (1802-1887), who was a famous soldier in India, who in 1857 was made K.C.B. and in 1874 G.C.B., having previously attained the rank of general.

VIVIANITE, a mineral consisting of hydrated iron phosphate Fe(PO₄)₂+8H₂O, crystalizing in the monoclinic system. The crystals possess a perfect cleavage parallel to the plane of symmetry and are usually bladed, in habit; they are soft (H=½), flexible and septic. The specific gravity is 2.6. When unaltered and containing no ferric oxide, the mineral is colourless, but on exposure to the light it very soon becomes of a characteristic indigo-blue colour. Crystals were first found in Cornwall (at Wheal Jane near Truro, associated with pyrhotite) by J. G. Vivian, from whom the species was named by A. G. Werner in 1817. The mineral had, however, been earlier known as a blue powdery substance, called "blue iron-earth," met with in peat-bogs, in bog iron-ore, or with fossil bones and shells. (L. J. S.)

VIVISECTION, literally the cutting (section) of living (vivus) animals, a word which might be applied to all surgical operations whether practised upon the lower animals or on man. As conventionally used, however, it has exclusive reference to experiments upon the lower animals undertaken for the advancement of medical sciences. There are a number of people who, calling themselves anti-vivisectionists, strongly object to these experiments on the lower animals; and it must be conceded that the humane reasons which they advance against it can only be set aside as "sentimental" if considerations of a wider humanity can show that the arguments of the anti-vivisectionists really run counter to human progress. The supporters of vivisection, properly considered, must not be confused with those who would make a barbarous use of this means of research. What is at stake here is the right to use it at all. It is possible that the making of experiments is unnecessary to result if the practice of vivisection were unrestricted; and the purpose of this article is to give some account of the method of experiments on animals as sanctioned by law in the United Kingdom, and to justify that method by setting forth the chief historical discoveries that have been made by the help of vivisection. Such experiments have for their object the advancement of the sciences of physiology and pathology. From the earliest periods experimental vivisections have occasionally been practised, but before the days of vivisection, in fact, it was very difficult to draw conclusions. The invention of anaesthetics has greatly extended the scope of the experimental method, because an animal can be kept unconscious and quiet, without even a quiver of a muscle, during prolonged operations. Further, the introduction of the antiseptic method has made it possible to subject all tissues and regions of the body to surgical interference, and this has also had the effect of increasing the possibilities of experimental research.

In 1906 a British Royal Commission was appointed to inquire into the whole subject under the chairmanship of Sir Charles Read, Bt., G.C.V.O., and Mr. A. J. Ramsay, K.C., took the chair. The Commission sat from October 1906 to March 1908, and heard no fewer than 21,761 questions and answers. In view of attempts on the part of the anti-vivisectionists to misrepresent the nature of the evidence given before the Commission, in January 1908 the supporters of experiments on animals founded the Research Defence Society, under the presidency of Lord Cromer; by July 1910 this society had some 1,500 members. Its official address is 27, Ladbroke Square, London, W. 2.

1. METHODS EMPLOYED.—The present act relating to experiments on animals was passed in 1876. At that time the majority of these experiments were physiological. There was, it may be fairly said, no such thing as bacteriology, no general following up of Pasteur's work. A few experiments were made in pathology, for instance in tuberculosis; and a few in surgery, in pharmacology, and in the action of poisons, especially snake venom. But the chief use of experiments on animals was for the advancement of physiology. The evidence given before the Royal Commission, in 1873, was almost entirely on physiological matters, on the discoveries of Harvey, Bell, Magendie and Claude Bernard, on the *Handbook for the Physiological Laboratory*, and so forth. The act, therefore, was drafted with a view to physiology, without much concern for pathology, and without foreknowledge of bacteriology. At the time of writing (1910), 95% of the experiments are inoculations. Every experiment must be made in a registered place open to government inspection. But inoculation experiments are sometimes
permitted in non-registered places, for the immediate study of outbreaks of disease, or in circumstances which render it impracticable to use a registered place. Every experiment must be made under a licence; and every application for a licence must be recommended by the signatures of two out of a small body of authorities specified in the Act; and for this purpose the licentiate shall, in every application to be made to the President of certain universities and colleges. The word "experiment" is not allowed to cover the use of more than one animal.

Most experiments are made not under a licence alone, but under a licence plus one or more certificates, and the wording and working of these certificates must be clearly understood, because it is over them that the question arises as to the amount of pain inflicted by these experiments. Under the licence alone, the animal must be kept under an anaesthetic during the whole of the experiment; and if the pain is likely to continue after the effect of the anaesthetic has ceased, or if any serious injury has been inflicted on the animal, it must be killed forthwith under the anaesthetic. Thus, under the licence alone, it is impossible to make an inoculation; for the experiment consists, not in the introduction of the needle under the skin, but in the observation of the results of the inoculation. A guine-pig inoculated with tubercle cannot be kept under an anaesthetic till the disease appears. The disease is the experiment, and it is therefore an experiment made without an anaesthetic, and not authorized by the licence alone. Again, under the licence alone, is it possible to follow out the thyroid treatment of myxoedema, or the facts of cerebral localization. For to remove the thyroid gland, or to remove a portion of the surface of the brain, is to inflict a serious injury on the animal. The operation is done under profound anaesthesia—it would be impracticable otherwise; the wound is treated and dressed by the antiseptic method—suppuration would invalidate the result. But a serious injury has been inflicted. Nevertheless, the animal will not be killed forthwith; the result must be watched.

The and the like experiment, if it be in any way represented, cannot be made under the licence alone. For the removal of such disabilities as these, the act empowers the home secretary to allow certain certificates, to be held with the licence. They must be recommended by two signatures, and various restrictions are put upon them by the home secretary. On July 11, 1898, the home secretary was asked, in the House of Commons, what were the conditions and regulations attached by the Home Office to licences and certificates; and he answered—

The conditions are not always the same, but may vary according to the nature of the investigation. It is hardly possible, therefore, for me to state all the conditions attached to licences and certificates. The most important conditions, however (besides the limitations as to place, time and number of experiments), and the conditions most frequently imposed, are those as to reporting and the use of antisepsics. The latter condition is that the animals are to be treated with strict antisepotic precautions, and if these fail and pain results, they are to be killed immediately under anaesthetics. The reporting conditions are, in brief, that a written record, in a prescribed form, is to be kept of every experiment, and is to be open for examination by the inspector; that a report of all experiments is to be forwarded to the inspector; and that any published account of an experiment is to be transmitted to the secretary of state. Another condition requires the immediate destruction under anaesthetics of an animal in which severe pain has been induced, after the main results have been ascertained.

The home secretary attaches to licences and certificates such endorsements as he thinks fit. The bare text of the act, now thirty-four years old, is a very different thing from the administration of the act; and the present writer is in a position to say that the act is administered with great strictness, under a careful system of inquiry and reference.

The certificates are distinguished as A, B, C, E, EE and F. Certificate D, which permitted the testing, by experiments, of "former discoveries alleged to have been made," has fallen into disuse. Certificate C permits experiments to be made by way of illustration of lectures. They must be made under the provisions contained in the act as to the use of anaesthetics. Certificates E and EE permit experiments on dogs or cats; certificate F permits experiments on horses, asses or mules. These certificates are linked with Certificate A or Certificate B. It is round these two certificates, A and B, that the controversy as to the pain caused by experiments on animals is maintained.

Certificate A permits experiments to be made without anaesthesia. It is worded as follows: "Whereas A. B. of [here insert address and profession] has made, and herewith submits, evidence of the scientific value of his proposals, if duly authorized under the above-mentioned act, to perform on living animals certain experiments described below. We hereby certify that, in our opinion, insensibility in the animal organism can only be brought about by such experiments as are induced by anaesthetics without necessarily frustrating the object of such experiment." All inoculations under the skin, all feeding experiments and tests are scheduled under this certificate. They must be scheduled separately under a licence alone. Though the only instrument used is a hypodermic needle, yet every inoculation is officially returned as an experiment, causing pain, permitted without an anaesthetic. It is for inoculations and the like experiments, and for them alone, and for nothing else, that Certificate A is allowed (or A linked with E or F). This want of a special certificate for inoculations, and this wresting of Certificate A for the purpose, have led to an erroneous belief that "cutting operations" are permitted by the act without an anaesthetic. But, as the home secretary said in Parliament in March 1897, "Certificate A is never allowed except for inoculations and similar trivial operations, and in every case a condition is attached to prevent unnecessary pain." And again he wrote in 1898: "Such special certificates are required for experiments without anaesthesia involving incisions, feeding and similar procedures involving no cutting. The animal has to be killed under anaesthetics if it be in pain, so soon as the result of the experiment isascertained."

The conditions of Certificate B are that it is free of the life of the animal after the initial operation of an experiment. It is worded as follows:

"Whereas A. B. of [here insert address and profession] has represented (i.e. two certificates, or under the above-mentioned act, to perform on living animals certain experiments described below, such animals being, during the whole of the initial operation of such experiments, under the influence of some anaesthetic of sufficient power to prevent their feeling pain: We hereby certify that, in our opinion, the killing of the animal on which any such experiment is performed before it recovers from the influence of the anaesthetic administered to it would greatly interfere with the normal influence of the gland was the initial operation; and this was performed under an anaesthetic, and with the antiseptic method. Then the animal was killed. The observations which were required of the experiment during the observation alone, but the two together. The purpose of this certificate is set forth in the inspector's report for 1909. "In the experiments performed under Certificate B, or C (or linked with EE or F) experiments are performed under anaesthetics from the influence of which the animals are allowed to recover. The operations are required to be performed antiseptically, so that the healing of the wounds shall, as far as possible, take place without pain. If the antisepotic precautions fail, and suppuration occurs, the animal is required to be killed. It is generally essential for the success of these experiments that the wounds should heal cleanly, and the surrounding parts remain in a healthy condition. After the healing of the wounds the animals are not necessarily, or even generally, in pain, since experiments involving the removal of important organs, and affecting the vessels and parts of glands, are performed in an experiment performed under Certificate B, or C linked with EE, a condition is attached to the licence requiring all operative procedures to be carried out under anaesthetics of sufficient power to prevent the animal feeling pain; and no observations or stimulations of a character to cause pain are allowed to be made without the animals being anaesthetized. In no case has a cutting operation more severe than a superficial incision (the opening of the skin) been performed on an animal under the skin been allowed to be performed without anaesthetics."

From this brief account of the chief provisions of the act, we come to consider the general method of experiments on animals in the United Kingdom, and the question of the infliction of pain on them. The figures for a representative year may be given. The total number of licensees in 1909, in England and Scotland, was 483: of whom 135 performed no experiments during the
year. The total number of experiments was 86,277, being 2357 less than in 1908. They were made as follows:—

| Certificate C | 196 |
| Certificate A | 81,566 |
| Certificates A-E | 595 |
| Certificates A-F | 228 |
| Certificate B | 1,385 |
| Certificates B+E+EE | 319 |
| Certificate F | 8 |

The experiments performed under Certificate A (or A+E, or A+F) were mostly inoculations; but a few were feeding experiments, or the administration of various substances by the mouth or by inhalation, or the abstraction of blood by puncture or by simple venesection. Inoculations into deep parts, involving a preliminary incision, are required to be performed under anaesthetics (Certificate B).

"It will be seen," says the report for 1909, "that the operative procedures in experiments performed under Certificate A, without anaesthetics, are only such as are attended by no considerable, if appreciable, pain. The certificate is, in fact, not required to cover the proceedings, but to allow of the subsequent course of the experiment."

The animals most used for inoculations are mice, rats, guinea-pigs and rabbits. It is not once in a thousand times that a dog or a cat is used for inoculation. The act of inoculation is not in itself painful. A small area of the skin is carefully shaved and cleansed, that it may be aseptic, the hypodermic needle is sterilized and the method of hypodermic injection or of vaccination is the same as it is in medical practice. "A guinea-pig that will rest quietly in your hands before you commence to inject it, will remain perfectly quiet during the introduction of the needle under the skin; and the moment it is returned to the cage it resumes its interrupted feeding. Arteries, veins and most of the parts of the viscera are without the sense of touch. We have actual proof of this in what takes place when a horse is bred for the purpose of obtaining curative serum. With a sharp lance a cut may be made in the skin so quickly and easily that the animal does nothing more than twitch the skin-muscle of the neck, or give his head a shake, while of the further proceeding of introducing a hollow needle into the vein, the animal takes not the slightest notice. Some horses, indeed, will stand perfectly quiet during the whole operation, munching a carrot, nibbling at a wad of hay, or playing with a button on the vest of the groom standing at its head." These sentences, written in the Medical Magazine (June 1808) by Dr Sims Woodhead, Professor of Pathology at Cambridge, are sufficient evidence that inoculations and the like experiments are not painful at the time. In a few instances cultures of micro-organisms have been made in the anterior chamber of the eye, by the introduction of a needle behind the cornea. This might be thought painful, but cocaine renders the surface of the eye wholly insensitve. Many operations of ophthalmic surgery are done under cocaine alone, and the anterior chamber of the eye is so far insensitve that a man may have blood or pus (μυγωμα) in it, and, scarcely conscious of the fact. The results of inoculation are in some cases negative, in others positive; the positive results are, in the great majority of cases, not a local change, but a general infection which may end in recovery, or in death. The diseases thus induced may, in many cases, fairly be called painless—such as septicemia in a mouse, snake-venom in a rat, and malaria in a sparrow. Rabbits affected with rabies do not suffer in the same way as dogs and some other animals, but become subject to a painless kind of paralysis. It is probable that animals kept for inoculation the whole, less pain than falls to the lot of a like number of animals in a state of nature or in subjection to work: they are well fed and sheltered, and escape the rapacity of larger animals, the inevitable cruelties of sport, and the drudgery and sexual mutilation that man inflicts on the higher domestic animals.

The present writer has, of course, seen the mice that are used for the study of cancer (Imperial Cancer Research Fund), and the guinea-pigs that are used at the Lister Institute for the testing of the London milk-supply, lest the milk should convey tubercle. He did not see, among all the many animals, one that appeared to be suffering: save that a very few of the mice were incommoded, or, if the word be applicable to mice, distressed, by large tumours. Of the guinea-pigs that had been inoculated, not one seemed to be in any pain. A nodule of tubercle, or a tuberculous gland, is painless in us, and therefore cannot be painful in a guinea-pig. It is not denied that the study of some diseases (plague, tetanus) causes some pain to rats and rabbits; but this pain is hardly to be compared with the pain and horror of these diseases in man.

The animals are now to be considered under Certificate B. If it were lawful, under Certificate B, to make an incision under an anaesthetic, to call this the "initial operation," and then, without an anaesthetic, to make painful experiments, through the incision, on the deeper structures, doubtless much pain might be inflicted under this certificate. But experiments of this kind can be, and are, made under the licence alone, the animal being kept under an anaesthetic all the time, and killed under it. "No experiments requiring anything of the nature of a surgical operation, or that would cause the infliction of an appreciable amount of pain, are allowed to be performed without an anesthetic" (Inspector's report for 1896). "The operations (B) are granted on condition that antiseptic precautions are used; and if these fail, and pain continues after the anaesthetics have ceased to operate, the animal is immediately killed painlessly" (Letter from the Home Secretary, 1898).

Of experiments made under this certificate (which must be linked with Certificate EE for any experiment on a dog or a cat), three instances may be given here: an operation on the brain, a removal of part or the whole of a secreting gland, and the establishment of a fistula. It is to be noted that, for these and the like operations, profound anaesthesia and the strict observance of the antiseptic method are matters of absolute necessity for the success of the experiment: the operation could not be performed without anaesthesia; and the experiment would come to nothing if the wound suppurred. It is to be noted, also, that these operations are such as are performed in surgery for the saving of life or for the relief of pain.

As to operations on the brain, it must be remembered that the surface of the brain is not sensitive. Therefore the removal or destruction of a portion of the surface of the brain, or the division of some tract of central nervous tissue, though it might entail some loss of power or of control, does not cause pain; a wound of the brain is painless. Tension within the cranial cavity, as in cases of cerebral tumour or cerebral abscess, may indeed cause great pain; and, if the aseptic method failed in an experiment, inflammation and tension would ensue: in that case the animal must be killed.

The removal of part or the whole of a secreting gland (e.g. the thyroid, the spleen, the kidney) is performed by the same methods, and with the same precautions, as in human surgery. Profound anaesthesia, and the use of a strict antiseptic procedure, are of absolute necessity. The skin over the part to be removed must be shaved and carefully cleansed for the operation; the instruments, sponges and ligatures must be sterile, not capable of infecting the wound; and when the operation is over, the wound must be carefully closed with sutures, and left to heal under a proper surgical dressing.

The establishment of a fistula, again, is an operation practised, as a matter of course, in large numbers of surgical cases. The stomach, the gall-bladder, the large intestine, are opened for the relief of obstruction, and kept open, either for a time or permanently, according to the nature of the case. Under anaesthesia, the organ that is to be opened is exposed through an incision made through the structures overlying it, and is secured in the wound by means of fine sutures. Then, when it has become adherent there, it is opened by an incision made into it; no anaesthetic is needed for this purpose, because these internal organs are so unlike the skin in sensitiveness that an incision is hardly felt: the patient may say that he "felt a prick," or he may be wholly unconscious that anything has been done. A
fistula thus established is not afterward painful, though there may be some discomfort now and again.

The classical instance is the case of Alexis St Martin, who was shot in the stomach in 1822, and recovered, but with a fistula. He let Dr Beaumont make experiments on him for nine years: "During the whole of these periods, from the spring of 1824 to the present time (1833), he has enjoyed general good health...active, athletic and vigorous; exercising, eating and drinking regularly, healthy and active people. For the last four months he has been unusually plethoric and robust, though constantly subjected to a continuous series of experiments on the perforation of the stomach; allowing the food and drink to be introduced or taken out at the aperture different kinds of food, drinks, elastic catheters, thermometer tubes, gastric juice, chyme, &c., almost daily, and sometimes hourly. Such have been the results of the circumstances for seven years other and he now enjoys the most perfect health and constitutional soundness, with every function of the system in full force and vigour." (Beaumont, Experiments and Observations on the Gastric Juice, 1836).

We come now to the question, What anaesthetics are used in these experiments, and are they properly administered? The anaesthetics used are—(1) chloroform, ether, or a mixture containing chloroform and ether; (2) morphia, chloral, urethane. It is sometimes said that morphia is not an anaesthetic. That depends on the quantity given. Not a month passes in this country without somebody killing himself or herself with morphia or chloral. They die profoundly anaesthetized: they cannot be roused; even the pain of a strong electric shock is not enough to rouse them. So it is with animals. The doses given to them are enormous and produce complete insensibility. On this point the evidence given before the Royal Commission of 1906-9 by Mr Thane, Professor Henry Dixon, Dr Dudley Buxton and Professor Starling is absolutely conclusive. "As to the statements," says Sir Lauder Brunton, "that chloral and opium or morphia are not narcotics, and do not remove pain, there is no other word for it, it is simply a lie; you may as well say that chloroform does not remove pain. If you give any animal a sufficiently large dose of chloral or opium, you so completely abolish sensibility that there is nothing you can do that will awaken its sensibility. The animal is as senseless as a piece of board."

With regard to chloroform, ether and the A.C.E. mixture, it is absolutely certain that animals can be kept, with these anaesthetics, profoundly unconscious for three or four or more hours. Nothing on this point is more worthy of consideration than the evidence in veterinary surgery, given before the Royal Commission by Mr Hobday, one of the very foremost veterinary surgeons in this country (Reports of Evidence, vol. iv. Q. 16284-16353). The opponents of all experiments on animals are apt to believe that dogs and cats must be bound and fastened on boards, and then have the anaesthetic given to them. That is not the case. They can be given just as well, for many of the operations of surgery, are bound in position. And, of course, dogs and cats cannot lie on their backs as we can. "The usual thing we do," said Professor Starling, in his evidence before the Royal Commission, "is to give the animal, half an hour before the experiment, a hypodermic injection of morphia, of about a quarter of a grain—from a quarter to a third. The effect of that is, that the dog becomes sleepy and stupid, and then sometimes it will lie down quietly, and if it is very sleepy you can put a mask over its nose containing the chloroform and alcohol and other mixture, which it takes in at once. If, at the time one wants to begin the operation, the animal is not fully under the influence of morphia—it if still seems restless—it is put in a box, and there it has some wool saturated with the A.C.E. mixture put in the box. The air gradually gets saturated, the dog gets more and more sleepy, and finally subsides at the bottom of the box."

A few words must be said here about curare. It was said, some years ago, by an opponent of experiments on animals, that curare was "inseparable throughout England" whereas, it is seldom used at all, and is never used alone in any sort or kind of operation on any animal in this country; in every such case a recognized anaesthetic must be given. It is true that curare is more frequently used in the stomach in the circumstance of the stomach; but it is in small doses only, and in large doses abolishes the movement of the voluntary muscles, but also acts as an anaesthetic: in small doses it acts only on the voluntary muscles, i.e. on the endings of the motor nerves going to these muscles. For example, suppose that the object of the experiment is to observe and record the action of a nerve on the contraction of certain blood vessels. The nerve gives off some branches to muscles, and other branches to blood vessels. If the animal be anaesthetized, and the nerve stimulated, muscles and vessels will both contract; but, if curare be given, as well as an anaesthetic, the vessels alone will contract, without the muscles; for curare does not on the endings of motor nerves, but on vessels. But, as a practical matter, curare is very hard to obtain, and is often impure, and is very seldom used. One of the inspectors said to the Royal Commission that he had once seen it used, fifteen years ago."

Professor Schäfer said that he had not used it for twenty years. Professor Morris said, it is 'not possible to be at all.' And Sir Lauder Brunton said that he did not think he had used it at all since the period 1876. The fear that, in a case, if curare was being used, the effect of the anaesthetic might 'pass off,' and the animal be left under curare alone, is not reasonable. The dosage and administration of anaesthetics is not such as to kill the animal; and the same small dose of chloroform vapour, it is of necessity under the influence of the chloroform; and the anaesthesia will gradually become not less but more profound. (See the evidence given before the Royal Commission by Professor Langley and Professor Waller.)

It may be interesting to compare the pain, or death, or discomfort among 6,277 animals used for experiments in Great Britain in 1909, with the pain, or death, or discomfort of an equal number of the same kinds of animals, either in a state of nature, or kept for sport, or used for the service of human profit or amusement. But it would be outside the purpose of this article to describe the cruelties which are inseparable from sport, and from the killing of animals for food, and from fashion; neither is this the place to describe the millions of men who keep to hounds, and hounds to hunt, or hunters to breed hounds, or breeders. As one of the Royal Commissioners recently said, the farmyards, at certain times of the year, simply "seethe with vivisection." The number of animals wounded in sport, or in traps, cannot be guessed. Against this vast amount of suffering we have to put an estimate of the condition of 6,277 animals used for medical science. Ninety-five per cent. of them were used for inoculation. In many of these inoculations the result was negative: the animal did not take any disease, and thus did not suffer any pain. In many, more, e.g. cancer in mice, tubercle in guinea-pigs, the pain or discomfort, if any, may fairly be called trivial or inconsiderable. It could hardly be said that these small animals suffer much more than an equal number of the same kind of animals kept in little cages to amuse children. There remain 3888 animals which were submitted to operation under an anaesthetic. In the greater number of these cases the animal was killed then and there under the anaesthetic, without recovering consciousness. In the remaining cases the animal was allowed to recover, and to be kept for observation; but no further observation of any kind, which would cause pain, was allowed to be made on it, or taken off it. Many of these cases, thus allowed to recover after an operation, may fairly be compared to an equal number of domestic animals after one of the formal operations of veterinary surgery. These observations made under Certificate B form but a very small proportion of the total number of experiments on animals in the United Kingdom; and they have led, in recent years, to discoveries of the very utmost importance for human life and health.

II. SCIENTIFIC RESULTS.—We come now to consider the results of experiments on animals, but we must remember that we alone, but animals also, owe a great debt to them. Great epizootic diseases like anthrax, swine-fever, chicken cholera, silkworm disease, pleuro-pneumonia, glanders, Texas cattle fever, blackleg, tuberculosis in cattle, have killed yearly millions of animals, and have been brought under better control by these experiments. The advantages that have been obtained for man may be arranged under two heads—(A) Physiology, (B) Pathology, Bacteriology and Therapeutics.

A. PHYSIOLOGY

1. The Blood.—Galen (A.D. 131) confuted the doctrine of Erasistratus, that the arteries contained xvivida, the breath of life, proving
by experiment that they contain blood. "Ourselves, having tied the exposed arteries above and below, opened them, and showed that they were indeed full of blood." Realdis Columbus (1559), though he did not discover the general or "systematic" circulation, attempted what is known as "Montesquieu's experiment," the pulmonary circulation. "The blood is carried through the pulmonary artery to the lung, and there is attenuated; thence, mixed with air, it is carried through the pulmonary veins into the left heart." Bichat afterward noted or left on record, though it is most worthy of the observance of all men.... And this is as true as truth itself; for if you will look not only at the conditions of the arteries and veins, but always find this pulmonary vein full of blood, which assuredly it would not be if it were designed only for air and vapours.... Verily I pray you, O candid reader, studiosus of authority, but more studious of the human condition, and the control of the pulmonary vein full of blood, not air or fuligo, as these men call it, God help them." Harvey's treatise De Motu Cordis et Sanguinis in Animalibus was published at Frankfurt in 1621. It begins thus: "When by many dissections of living animals, as they came to hand—Cum multis vivorum dissectionibus, ut ad manum doabuntur,—I first gav myself to observing how I might discover, with my own eyes, and not from books the writings of others, to use and purpose of the movement of the heart in animals, for which I found the matter hard indeed and full of difficulty; so that I began to think, with Frascatarius, that the movement of the heart was not observed in any animal. At last I conceived that the disquisition and diligence, by frequent examination of many and various living animals—mutila frequentere et varia animalia vivo introspiendo— I came to believe that I had succeeded, and had escaped every purpose for which I had covered what I desired, the movement and use of the heart and the arteries. And from that time, not only to my friends but also in the presence of all, I could demonstrate the passing from the body of man or beast, by experiment." I did not fear to set forth my opinion in this matter." Here, and again at the end of the Preface, and again in the eighth chapter of the De Motu, he puts his experiments in the very forefront of the argument. "For the chyle from the mesentery, whence vessels of the deep mesentery of the live frog, made out the capillary vessels. He writes to Borelli, professor of mathematics at Pisa, that he has failed in every attempt to discover them by injecting fluids into the larger vessels, but has succeeded by examining the tissues with the microscope: "Such is the divarication of these little vessels coming off from the vein and the artery, that the order in which a vessel issues from the heart is not observable; but the threads of blood are seen to be woven from the offshoots of both vessels" (De Pulmonibus, 1661). Stephen Hales (1733), rector of Farrington and minister of Teddington, and later a professor of medicine at King's College, London, made the first exact estimates of the blood pressure, the rate of the heart, and the flow; and divided the life of the human being into eight hours, each hour being divided into two parts, or four equal parts. In the eighth hour, the seven white threads were examined. The one end of a vertical glass tube was inserted into the crural artery of a mare, and noting the rise of the blood in the tube (Statical Essays, cont. the Motion of the Blood, 1733). Three tubes were used, one for the right, and two for the left side of the body. Hales was the first to use a thermometer to take the temperature of the blood. In 1752 Réaumur began his observations on this fluid, making birds swallow fine fenestrated tubes containing grain or meat, or even pieces of a man, these being absorbed and observed in the dissolution of food, not in any sort of mechanical action or trituration. His observations were extended and perfected by Spallanzani (1777). Then came a period of uncertainty, with experiments of早已 inadequacy; but in 1817, 1818, and 1819, a prize for the best work on the subject, and Tiedemann and Gmelin submitted their observations to him. The work of Tiedemann and Gmelin, and the books of the early physiologists, are the result of the great number of their experiments, from which came not only the absolute proof of the existence of the gastric juice, but also the study of the transformation of starch into glucose. Thus the theory of digestion entered a new phase; it was finally recognized, at least for certain substances, that digestion is not simply dissolution, but a true chemical transformation" (Claude Bernard, Physiologie opératoire, 1879). Beaumont's experiments on Alexis St Martin (hides supræ) were published in 1858. They were, of course, based on the work of the physiologists: "I make no claim to originality in my opinions as respects the existence and opera- tions of the gastric juice, which was first pointed out by Tiedemann (with some modifications) taught by Spallanzani and many of the most enlightened physiological writers" (Beaumont's preface to his book). Eberle, in 1834, showed how this knowledge of the existence of the gastric juice led to the discovery of the chemical action of the stomach, and that the juice of the stomach, coming from the mucous membrane of the stomachs of animals after death: hence came the invention of the various preparations of peptic. Later, Blondlet of Nancy, in 1842, studied the gastric juice by the method of purest starch. Many of the observations have been made on the movements of the stomach during digestion, and on the influences of the nervous system on the process. The liver, the pancreas and the intestinal glands, all are concerned. The recent work of Pawlow and of Starling has greatly advanced our knowledge of the actions of the secretions from these organs. The effect of these secretions on the acidity of the stomach is physical, from the taking of food into the mouth to the expulsion of the waste residue, is now viewed in its entirety; and especial study has been given to the influences, nervous or chemical, which
are exercised, as it were, on a particular tract of the digestive system, at the bidding of another tract. Pavlov, recognizing the importance of keeping the animals under the most normal conditions, and of studying the digestive system in animals not anaesthetized, yet free from pain or distress, made use of fistulae established at different points of the digestive canal, and was able to study the digestive juices at different stages of the digestive process, under normal conditions, by Dr. Haller. The work of Pavlov has been further developed by Professor Starling's recent work on the chemical substances produced in the body, during the act of digestion, to promote digestion.

As the operation of vivisection, and destruction of sugar in the body, was begun in 1843. His discovery of the glycogenic action of the liver, was made by keeping two dogs on a diet deficient in both sugar and fat. He put a fistula into one of them during digestion, and testing the blood in the veins coming from the liver: What was my surprise when I found a considerable quantity of sugar in the hepatic veins of the dog that had been fed on meat, and a very much smaller quantity of sugar substance (glucose) of the animal was allowed to remain. (Newall's Mémoire, 1853.)

5. The Pancreas.—The 17th century was a time of very fanciful theories about the pancreas (Linnaeus, Wharton, Bartholin), which was regarded as a kind of salivary gland. None of these physicians had the wisdom to see that the pancreas must be estimated, not according to its position, but according to its structure, as one of the nature of the salivary glands. He closed his pupil, I do not know why it was, Grasart's greyhound, and I say in my hand to the wool; and though many times I desired of success, yet at last, by the blessing of God on my work and prayers, in the year 1766, I discovered the pancreatic system, and after that, as the panegraut. By the method of a fistula he collected and studied the secretion of the contents of the pancreas; and by further experiment he refuted Bartholin's theory that the pancreas was a sort of apparatus or "biliary vesicle" of the stomach. But he got no help from the chemistry, and, on the other hand split up into fatty acids and glucose, the neutral fat; he clearly proved that it had a powerful action on starch, converting it into sugar. He was the first to give it that name, and that of a proteine matter. At a later date it was discovered that the pancreas, beside its work in digestion, has an "internal secretion"; that it, like the thyroid gland and the suprarenal capsules, helps to maintain the general metabolism of the body. Professor Schäfer, writing in 1894, says on this subject: It was discovered a few years ago by von Mering and Minkowski that if, instead of merely diverting its secretion, the pancreas is bodily removed, the metabolic processes of the organism, and especially the metabolism of carbo-hydrates, are entirely deranged, the result being the production of permanent diabetes. But if even a very small part of the gland is left within the body, the carbo-hygrosis metabolism remains unaltered, and there is no diabetes. The small portion of the organ which has been allowed to remain (and which need not even be left in its proper place, but may be transplanted to other or elsewhere), as long as it continues to exert its action, which go on between it and the blood generally, to prevent those serious consequences to the composition of the blood, and to the general constitution of the body, which result from the complete removal. The complete removal of the pancreas, in a cat or a dog, may cause fatal diabetes, is of importance, because the pancreas in some cases of diabetes in man is diseased; but, at present, experiments on animals have not led to any certain or specific cure of diabetes in man.

6. The Growth of Bone.—The experiments made by Du Hamel (1739-1843) on the growth of bone by deposit from the peritoneum (the cavity of the abdominal cavity) on the fascia lata, by the zymotic observation (1735) that the bones take up the stain of madder mixed with the food. Du Hamel studied the whole subject very carefully, and established this important fact, for preserving putrefying material, which is an important fact in all operations on the bones. As he puts it, in the title of one of his own memoirs, Les os croissent en grosseur par l'addition de couches osseuses qui tirent leur origine du peristéum, c'est-à-dire ligneux et de plusieurs manières, sur l'addition de couches ligneuses qui se forment dans l'écorce. By feeding pigs at one time with dried food, at another with undried food, he obtained their bones in concentric layers alternately stained and unstained. His facts were confirmed by Bazan (1746) and Bichat, who were both of a different opinion, and by the experiments of Duhamel and Haller. Still, he brought men to study the whole subject of the growth of bones, in length as well as in thickness, and the whole modeling of the bones, in adult life, by deposit and absorption. Biiezpeat's discoveraus system of physiology and in surgery. Later, from the point of view of surgery, Syne (1837) and Stanley (1849) made experiments on the growth of bone, and on the exfoliation of dead bone; and, after them, Oliven in the inductive parts of surgical practice has been of the very highest value.

7. The Nervous System.—A. The Nerve-Roots.—Through all the cerebration, and in the cerebral system, the cerebellum, which was worked out by Sir Charles Bell, who lived in the time of George III., no great advance was made in our knowledge of the nervous system. The way of experiment, which had led Galen far ahead of his age, was neglected, and everything was overwhelmed by the results of various experiments by their nerve-trunks) and held together by the same sheath. On laying bare the roots of the spinal nerves I found that I could cut across the spinal nerves. The experiments of people, which took it, the spinal marrow, without conning the muscles of the back; but that on touching the anterior fasciculus with the point of the knife, the muscles of the back were immediately convulsed. Such were my results for concluding that the cerebellum and cerebrum were a different system, we were in the position, and that every nerve possessing a double trunk. In the 19th century, it was discovered, with the nervous system of the embryo. But Sir Charles Bell in exercise, then power, and sensation, and the regulation of sensation, and the division consequently for the relief of pain was a useless operation.

B. The Medulla Oblongata and the Cerebellum.—Flourens, who was among the earliest students of the use of chloroform, is best known for his experiments on the respiratory centre and the cerebellum. He localized the cells in the medulla that govern the reflex movements of respiration. Afterward the discovery of cardiac and other centres in the neighbourhood of the respiratory centre. He showed also that the cerebellum is concerned with the equilibration and co-ordination of the muscles; that an animal, a few days old, deprived of sensation by the amputation of the spinal cord, was thus, the cerebellum also being removed, lost all power of co-ordination of the movements of the body, and that the experiments made by him and by others, it was found that the semi-circular canals of the internal ears are the terminal organs of the sense of equilibration.

The Vasomotor Nerves.—Claude Bernard, studying the sympathetic nervous system, discovered the vasomotor nerves that...
Indeed, it may truly be said that, alike in anatomy and in physiology, the whole present knowledge of the brain, the spinal cord and the nerves, is in great measure due to the use of experiments on animals. And this knowledge is daily applied to the diagnosis and treatment of diseases of the central nervous system. This is the result of what has happened since 1870; and we are now able to cure epilepsy, we are able to cure abscesses of the brain, and we are able to cure paralysis of the brain, because, as we go along, the same thing prevails. In fact, the first operation on the spinal cord I am responsible for, so that I know the history of the subject. The technique of that operation I owe entirely to experiments on animals. The method of operations and the removal of nerves, Bell's operative treatment of neuralgia was guided entirely by his experiments on animals. Then, we come to the great subject of nerve suture. The neural suture being first carried out by Flourens, who was the first, to my knowledge, to make experiments on animals, to suture nerves together, then, to investigate their function. (Sir Victor Horsley, evidence before the Royal Commission, vol. iv, p. 124).

These notes cover a part only of the results that have been obtained in physiology by the help of experiments on animals. The work of Boyle, Hunter, Lavoisier, Despretz, Regnault and Haldane, on animal heat and on respiration; of Petit, Dupuy, Dupuy and Petit, on chemical and organic agency; of Haller, du Bois-Reymond and Pflüger, on muscular contraction—all these subjects have been left out, and many more. In his evidence before the Royal Commission, Dr. Fritsch stated that he was fully convinced that physiology can progress only by the aid of experiments on living animals. I cannot think of any one step which has been made in physiology without that aid.

B. PATHOLOGY, BACTERIOLOGY AND THERAPEUTICS

1. INFLAMMATION.—Pathology is so intimately associated with the work of the microscope that it is a new study, in comparison with physiology. In 1850 the microscope was not in general use. It could not, of course, nor did must have these microscope cover-slip fluids that are essential to modern histology. Bacteriology, again, is even younger than pathology. In 1875 it had hardly begun to exist. For example, in the evidence before the Royal Commission (1875) one witness wrote: 'They were beginning to get an idea of the nature of tubercle.' Anthrax was the first disease studied by the methods of bacteriology; and in his evidence concerning this disease, Sir John Simon speaks of bacteriology as of a discovery wholly new and unexplored. Then, in 1881, Koch's discovery of the bacillus of tuberculosis. But a great advance was made, in days before 1875, by the more general use of the microscope. Every change in the tissues during inflammation—the slowing of the blood stream in the capillary vessels, the escape of the leucocytes through their walls into the surrounding tissues, the stagnation of the blood in the affected part—all these changes were observed in small animals, by means of the microscope, in the mesentery of the frog, the bat's wing, or the tadpole's tail, irradiated by a drop of acid, or a crystal of salt, or a scratch with a needle. It was seen that the movement of the leucocytes and other of these observations the rhythmic contraction of veins, and Waller and Coehn observed the escape of the leucocytes, disperedus, through the walls of the capillaries. From these simple experiments under the microscope arose all our present knowledge of the minute processes of inflammation. Later came the work of Metchnikoff and others, showing the importance of disperedus in relation to the presence of bacteria in the tissues.

2. SUPURATION AND WOUND-INFECTION.—Practically every case of suppuration, wound-infection or blood-poisoning, all abscesses, boils, carbuncles, and all cases of purulent fever, septicaemia, or pyaemia, inflammation, infection, either from without or from within the body by various forms of micro-organisms. The same is true of every case of erysipelas, or cellulitis, or acute gangrene—in short, of the whole multitude of septic diseases. The work done on these microorganisms has led to other pathologies, more complete and more perfect, and the result of this course of study has been to modify the acute and morbid state. It would be hard to find a more striking instance of the familiar truth that science and practice work hand in hand.

Again, the experimental method has thrown a flood of light on the subject of inflammation and suppuration in the central nervous system. For example, if we knew what is called Marchi's method; it was described to the Royal Commission (1906-8) by Dr Head and Sir Victor Horsley. It was found, by Professor Waller, that nerve-fibres, separated from the nerve-cells which nourish them, degenerate in a definite way.

The application of this law experimentally has been of great value. 'Let me,' says Dr Head, 'just take a simple. Imagine a wall covered with greyish-yellow paint. Suppose now that the paint comes off from which of these stems any one branch takes its origin, we could cut one stem, and every leaf arising from it would die, marking our whole course of the divided stem. This is the principle that has been used in tractography of the central nervous system. Gowers, by applying this method, discovered the ascending tracts in the lateral columns of the spinal cord. If a great nerve is divided, the nerve-cells degenerate, be treated with osmic acid (Marchi's method), the degenerate fibres show dark; and in this way their course may be traced at all levels of the cord.
as merely accidental concomitants of putrefaction; but now shown by Pasteur to be its essential cause. The present antiseptic method includes the use of heat; that is to say, the instruments and other accessories of an operation are "sterilized" by heat; and, where heat cannot be applied, as to the patient's skin and that of the surgeon's hands, antiseptics are used. Modern surgery is both antiseptic and aseptic.

3. Anthrax. — The bacillus of anthrax (charbon, malignant pustule, wool-sorter's disease) was the first specific micro-organism discovered. Davaine (1855) observed the petit bédouin in the blood of sheep dead of the disease; and in 1861 Pasteur's observations on lactic-acid fermentation were published. Davaine recognized that the bédouins were not blood-broth, and Koch afterwards succeeded in cultivating the bacillus, and in reproducing the disease in animals by inoculation from these cultures. Pasteur's discovery of preventive inoculation of animals against the disease was communicated to the Agriculture des charbonneux in France, and in May, 1881, he gave his public demonstration at Pouilly-le-Fort. Two months later, at the International Medical Congress in London, he spoke as follows of this discovery:

"...La méthode que je viens de vous exposer pour obtenir des vaccins du charbon était à peine connue qu'elle passait dans la grande pratique pour prévenir l'affection charbonneuse. La France perd chaque année pour une valeur de plus de vingt millions de francs des charbon de boeufs de 30 millions, m'a dit une des personnes autorités de notre Ministère de l'Agriculture; mais des statistiques exactes font encore défaut. On n'a jamais voulu mettre à l'épreuve les résultats qui précèdent par une grande expérience publique, à Pouilly-le-Fort, en raison du mal..."

... Je la résume en quelques mots; 50 moutons furent mis à disposition, nous en vaccinâmes 25, les 25 autres ne subirent rien de particulier. Quinze jours après l'environnement, les 50 moutons furent inoculés par le microbe charbonneux le plus virulent de la ville, 25 vaccins résistèrent; les 25 non-vaccinés moururent, tous charbonneux, en cinquante heures. Depuis lors, dans mon laboratoire, on ne peut pas chercher à préparer assez de vaccin pour tous les besoins des fermiers. En quinze jours, nous avons vacciné dans les départements voisins de Paris près de 20,000 moutons et un grand nombre de boeufs, de vaches et de chevaux.

"...The extent of this preventive vaccination may be judged from the fact that a single dose, given at the Sero-Therapeutic Institute of Milan, in a single year (1897-98) sent out 165,000 tubes of anti-charbon vaccine, enough to inoculate 330,100 sheep and boeufs..."

4. Tubercle. —Laennec, who in 1816 invented the stethoscope, recognized the fact that tubercle is a specific disease, not a simple degeneration of the tissues. Villenin, in 1865, communicated to the Académie des Sciences that he had proved the disease in rabbits by inoculating them with tuberculous matter; and he appealed to these inoculations—en voici les preuves—to show that "la tuberculose is non contagieuse, mais une maladie qui doit être étudiée dans un agent inoculable: l'inoculation se fait très-bien de l'homme au lapin; La tuberculose appartient donc à la classe des maladies zoonoses. In 1868 Chauveau produced the disease not by inoculation but by admixture of tuberculous matter with the animals' food. In 1880, after a period of some uncertainty and confusion
of doctrines, Cohnheim reaffirmed the infectivity of the disease, and even made the proof of tubercle depend on inoculation alone: "everything is tuberculous that can produce tuberculous disease by inoculation in rabbits, whereas this can never be done by inoculation alone."

In 1881 Koch discovered the bacillus tuberculosis, and, in spite of the tragic failure of his tuberculin in 1889-91, a vast amount of practical advantage has already resulted from it and from the vaccines derived from it.

A number of antitoxic substances of practical use have been developed by the Pasteur Institute in the service of medicine and surgery. The most important of these is the antitoxin against tetanus, in man or in animals, the antitoxin has proved of the very utmost value. This has been shown in striking ways in America. One of the worst naturally occurring diseases is tetanus. The Pasteur Institute has produced a tetanus antitoxin for use in Europe. The discovery of the bacillus and the antitoxin was the result of an acute scientific endeavor, this rule was not followed in this case. The antitoxin was first used in 1885.

The American Medical Association has compiled statistics of Fourth of July fatalities for the past six years. In 1903, the Fourth of July tetanus cases numbered 19, of which 15 were due to the use of antitoxin in all cases of blank-cartridge and common crack wounding.

As a result of this campaign of prophylaxis by antitoxin injections, from 416 cases of tetanus in 1903, the number dropped to 100 cases in 1904, 104 cases in 1905, 89 cases in 1906, 73 cases in 1907 and 55 cases in 1908. This reduction in the number of tetanus cases took place while the number of accidents remained practically the same. In 1906, the number of tetanus cases in the United States other than tetanus was steadily rising from 60 in 1903 to 108 in 1908. It is therefore evident that the saving of at least 300 lives from tetanus has been accomplished each year through the prophylactic use of antitoxin. The Fourth of July is thus said to have played a part in the work of the American Medical Association, particularly in the case of tetanus.

7. Rabies (hydrophobia).—The date of the first case treated by Pasteur's preventive method—Joseph Meister, an Austrian shepherd—was July 1885.

The existence of a specific micro-organism of rabies was a matter of inference. The incubation period of the disease is so variable that no preventive treatment was possible unless the incubation period had been accurately determined. The saliva of a rabid animal, introduced under the skin of animals, sometimes failed; and if it succeeded, the incubation period of the disease was thus induced. An emulsion was used not saliva, but an emulsion of the brain or the spinal cord, because the central nervous system is the chief seat of the poison. But this emulsion, introduced under the skin, was also uncertain in amount and gave no practically useful treatment since the poison has a selective action on the nerve cells of the central nervous system, and a sort of natural affinity with them, it must be introduced directly into them, where it will have its proper environment; the emulsion must be put under the skin, but under the dura mater (the membrane enveloping the brain). These subcutaneous inoculations were the turning-point of his work. By transposing the poison through a series of rabbits, by subcutaneous inoculation of each rabbit with a minute quantity of nerve tissue from the rabbit that had died before it, he was able to intensify the poison, to shorten its period of incubation, and to fix this period at six days. This period was determined by the time they began to die in the experiment, and the poison was thus entirely expelled from the system by a specific flagellate organism in superficial soil. It is said to be present in almost all rich garden soils, and that the presence of horse-dung favours its occurrence. There seems to be no doubt that the disease is produced by this organism. In 1890, the work of discovering and isolating the bacillus was full of difficulty. Nicolière, starting from the fact that the disease usually comes from wounds or scratches contaminated with earth, studied the saliva of rabbits with garden mould. He produced the disease, and succeeded in finding and culturing the bacillus, but failed to obtain an animal death from it. He termed the bacillus bacillus anthracis in 1890. The bacillus was then studied by the various French rabies institutes, and a number of observations were made. It has been proved that the infection tends to remain in the blood their chemical products, and that these have a selective action, like strychnine, on the cells of the central nervous system. Therefore the rule that the wounded tissues should be at once excised, and that the wound should be covered with a dressing that will be conducive to healing, is likely to be incorrect. Before Nicolière, while men were still free to believe that tetanus was the result of an acute ascending neuritis, this rule was neither enforced nor explained.

Nicolière, who was the first to apply antitoxin in the treatment of tetanus, in man or in animals, the antitoxin has proved of the very utmost value. This has been shown in striking ways in America. One of the worst naturally occurring diseases is tetanus. The Pasteur Institute has produced a tetanus antitoxin for use in Europe. The discovery of the bacillus and the antitoxin was the result of an acute scientific endeavor, this rule was not followed in this case. The antitoxin was first used in 1885.
to more active doses, guarded each day by the dose of the day before till he has manufactured within himself enough antitoxin to make him proof against any outbreak of the disease. (See HYDROPHOBIA.)

VIVISECTION. The specific organism of Asiatic cholera, the "comma-bacillus," was discovered by Koch in 1883; but such a multitude of difficulties arose over it that it was not universally recognized as the real cause of the disease before 1892, the year of the Bubonic Plague. The discovery of the Bacillus varius was the work of many men, but especially of Halfline, one of Pasteur's pupils. Ferran's earlier inoculations in Spain (1885) were a failure. Halfline's first inoculations were made in 1893. At that time, rabbits bled, rabbits vaccinated by Eberth, rabbits inoculated by von Tschudi, and from Agra went to many other cities of India. Altogether, in twenty-eight months (April 1893–July 1895) no less than 2,121 persons were inoculated, and over 225,950,000 cases; thirteen, causes; these, now, are the English-speaking men. While taking the experiment, Halfline says: "without having to record a single instance of mishap or accident of any kind produced by our vaccines." (See CHOLERA.)

10. Typhoid Fever.—The Bacillus typhosus was discovered by Klebs, Elzerth and Koch in 1880–81. The first protective inoculations in England were made when a regiment of 600 left Egypt for Malta in 1885. Thirty-two vaccinated and 29 unvaccinated. Later, in 1896, Byfield and Surgeon-Major Senple; 16 men vaccinated, and 2 others offered themselves as subjects. The first use of the vaccine during an actual outbreak of typhoid was in October 1897 at the Kent County Asylum: "All the medical staff and a number of attendants accepted the offer. Not one of those vaccinated—84 in number—contracted typhoid fever; while of those unvaccinated, and living under similar conditions, 16 were attacked. This is a significant fact, though it should in fairness be stated that the water was boiled after a certain date, and other precautions were taken, so that the vaccine cannot be said to be altogether responsible for the immunity." Still, the figures were admirable. (Lancet, March 1898). In 1899 Wright vaccinated against typhoid more than 3,000 of the Indian army, at Bangalore, Rawal Findi and Lucknow. Government has now sanctioned voluntary inoculation and the army has given public notice that a volunteer will be allowed to enter the regiment for inoculation. (Lancet, September 28, 1899). The regiment reached India, September 28. A month later, typhoid fever broke out; and during the following few months 63 cases were observed in the regiment. With but two exceptions, the disease attacked only the men who had not been inoculated, and both of these exceptions were men who had refused a second inoculation. Careful experiments were made with the second battalion of Royal Fusiliers in India in 1905 and 1906. The average strength of this regiment was 948 men. During the two years, 284 were inoculated with Wright's anti-typhoid vaccine, and 664 remained unvaccinated. Thirty-two of these were men who had not been inoculated; 9 had been inoculated. Five of the un inoculated died; none of the inoculated. Another Indian regiment, the 17th Lancers, in 1905, 1906 and 1907 inoculated about one-third of its men. During the three years it had 293 cases of typhoid fever. There were 44 deaths, with not a single death of an inoculated man. During the first half of 1908, in the largest seven Indian stations where the regiment was quartered, out of an average strength of 2,237 inoculated for inoculation. Typhoid developed in 2% of the un inoculated, and in less than 1% of the inoculated men. For fourteen months after the vaccination, no one died among the un inoculated and 1% was among the inoculated men. In the United States army, a medical board has strongly recommended anti-typhoid vaccinations, and vaccination is now effectually carried on in the army, and particularly received inoculation. The German army has adopted the same means of prophylaxis, and is "pushing it vigorously." (Waltlasse, loc. cit.).

"Widal's reaction" for the early diagnosis of the disease—a matter of the very highest practical importance. A drop of blood from the finger of a patient suspected to be suffering from typhoid fever, is diluted fifty or more times, that the perfect delicacy of the test may be secured. This drop is mixed with a nutrient fluid containing living bacilli of typhoid, and a drop of this mixture is observed under the microscope. The motility of the bacilli is instantaneous or very quickly arrested, and in a few minutes the motility is completely destroyed. The motility is also made visible to the naked eye by the subsidence of the agglutinated bacilli to the bottom of the containing vessel. The amazing delicacy of the Widal test is a part of the wonder. Its power of making a diagnosis after a recovery, a fiftyfold wonder, because it is obtained by cause clumping; it has even been obtained from an infant whose mother had typhoid shortly before the child was born. A drop of blood from a recovery is also taken, and post to be tested a hundred miles away, and the answer telegraphed back.

11. Malta Fever (Mediterranean fever).—The Micrococcus Maltae. Widal discovered in 1887 by Sir David Bruce. The disease is an epidemic fever, and preserving an immunizing serum was done at Netley Hospital. In this fever, as in typhoid and some others, Widal's disease from typhoid is, of course, a highly important practical matter. It is exceedingly difficult in the early stages." (Manson). Even in a dilution of 1 in 1000, the blood of Malta fever can give the typical reaction with the Widal's antitoxin. The presence of the bacillus of Malta fever and the disease that results from its presence has been identified as the disease that is an epidemic disease in Malta. The disease has been produced by the discovery of a horse for the preparation of serum-protective against Malta fever; and his blood, when examined, had a typical reaction with the Widal's antitoxin. The disease was only known in Malta before the Widal's disease has been identified in Malta fever for the last eight months, was immediately bled, and we are informed that the patient had two injections, each of 30 cub. cm. of the serum. He is doing well, and it is hoped that the attack has been cut short. About 50 cases of the fever, by April 1899, had been treated at Netley. The Lancet, April 15, 1899, says that the treatment was "with good success." When the drug treatment failed, the antitoxin treatment had been generally adopted, and it has now proved that the usual source of infection with Malta fever is the drinking of the milk of infected goats; thus, by the avoidance of infected milk, the fever may be prevented: and prevention is better than cure. In 1904 a commission was sent out to Malta by the Royal Society, at the request of our government, to discover how the fever is conveyed to man. They found that it is not conveyed by air, or by drinking-water, or by pollution of sewage, or by contact; nor are its germs carried, like those of malaria, yellow fever and sleeping sickness, on dust or insects. They found that it might be conveyed in milk, and before Bruce examined the milk-goats, since goats' milk is universally drunk in Malta. The goats looked healthy enough, but it was found that the blood of 50% of them gave the Widal reaction, and that their milk produced the reaction in about one-third of the cases. The milk from one of them, even for one day, almost invariably got the disease. On the 1st of July 1906, a special order was issued forbidding the supply of goats' milk to our garrisons. The year before this order was issued, milk had caused 116 cases, up to the 1st of July, there were 123 cases. During the rest of the year, including the three worst months for the fever, there were 40 cases. In 1907 there were 11 cases; in 1908 there were 5 cases; in 1909 there was 1 case; in 1910, by latest accounts, none.

12. Epidemic Meningitis.—The history of the serum treatment of epidemic meningitis affords an admirable example of the place of experiment on animals in the advancement of medical practice. This form of meningitis is one of the worst ways in which a man can die. Dr. Robb, who had charge of the Belfast fever hospitals in the early days of the Great Plague, found that 71 out of 200 cases of the disease died. The plague consumed its victims, and the public health authorities cannot prevent its sudden appearance in a town. "Many of those attacked," says Dr. Robb, "died within a few hours of the onset, and that after terrible suffering; while many of those who survived the acute attack lingered on for weeks and months, under the most terrific pain, and with suffering of the most hideous kind. Again, many of those who did survive were left permanently maimed." That is the usual picture of the disease when it is left to itself. By means of inoculation experiments, Dr. Flekner and Dr. Jobling, of the Rockefeller Institute, proved that the disease is due to a particular kind of germ, diplococcus intracellularis. They obtained this germ in a pure form, and of this they cultivated the germs all by themselves, in test tubes, apart from all other kinds of germs; and they were able to reproduce the disease in monkeys by injecting under the skin a minute quantity of this pure culture of the germs. It may be noted
that the disease in monkeys is less violent and less painful than it is in man. By the help of these experiments, Flexner and Jobling were able to prepare a serum for the treatment of the disease, in the same way as the serum is prepared which has been such a blessing to the world in cases of diphtheria. This serum for the treatment of epidemic meningitis was first used in the spring of 1907.

The contrast between cases without serum treatment and cases with serum treatment is very plain. We may first give the records before the use of the serum. Of 4000 cases in New York in 1904, 75 % died; Baker reports from Galveston (1906) 77.4 % mortality; Chalmers reports from Glasgow (1907) 998 cases with 683 deaths, giving 64.4 % mortality; Ballie reports in Belfast (1907) 623 cases with 493 deaths, giving 79.2 % mortality; Ker reports that in the Edinburgh epidemic the mortality was 78 % mortality; Robertson reports from Leith (1907) 62 cases with 74.4 % mortality; Turnour reports from the Transvaal 200 cases with 74 % mortality. Amongst patients treated in hospitals the death-rate was lower. Of 200 cases in Ban Hill Hospital, Glasgow, 79.2 % died; of 108 cases in Edinburgh Fever Hospital, 80.5 % died; of 275 cases in Belfast Fever Hospital, 72.3 % died; and Dunn reports that in the Boston Children's Hospital, during the eight years 1899-1907, the mortality varied from 69 % to 80 %. Contrast with these the results in cases treated with Flexner's and Jobling's Serum:

These figures speak for themselves. Similar results have been obtained with similar treatment in France and Germany. From these figures, says Dr Robb, "it will be seen that the death-rate in cases not treated with serum averaged some 75%. This has been reduced to about 15% in the cases treated from every hospital and in many instances much below that figure."

"My own experience has been that of 275 cases under my care in hospital, before the use of the serum was commenced, 72.3 % died; while of the 98 cases treated with serum 29.6 % died. No selection of cases was made: every case sent into hospital since September 1907 has been treated in this way. No change in the severity of the attack was observed; in the three months immediately before the serum arrived with us 45 cases came under treatment, of whom 37, or 82.6% died; and in the first four months after we began its use in hospital 30 cases were treated, of whom 8 died, a mortality of 26.6 %; while of the 36 cases treated with the serum in the same period, only 1 died, or a mortality of 2.8 %."

Great as this change in the death-rate has been, it is not more striking than the results of the patients in the other hospitals, for it was common to have cases running on into weeks and even months, such cases are no longer met with" (R. D. S. pamphlet, 1905).

13. Malaria.—Laveran, in 1880, discovered the Plasmodium malaris, an amoeboid organism, in the blood of malarial patients. In 1884 Manson took, as a working theory of malaria, the old belief that the mosquito is the intermediate host of the parasite. In 1885 came MacCulm's observations on an allied organism, Balantidium. In 1887, after two years' work, Ross found bodies, pigmented like the Plasmodium, in the outer coat of the stomach of the grey or "apple-winged" mosquito, after it had been fed on malarial blood. In February 1898 he started work in Calcutta: "Arriving sick into hospital, and not treated with the serum, over 80 % died. Great as this change in the death-rate has been, it is not more striking than the results of the patients in the other hospitals, for it was common to have cases running on into weeks and even months, such cases are no longer met with" (R. D. S. pamphlet, 1905).

14. Yellow Fever.—A special mosquito (Stegomyia) conveys yellow fever from man to man. The germ, like the germ of rabies, has not yet been made visible under the microscope. It is probably a certain minute spiral bacillus in the blood. The body of the mosquito told off for that purpose. The earlier experiments (1819-20) made on themselves by Chervin, Potter, Firth and others were truly heroic, but proved nothing. Finlay (1880-81) experimented with living mosquitoes and died; and certainly proved the transmissibility of the fever through mosquitoes. Sanarelli (1885) prepared an immunizing serum which gave good results; but it was reserved for the future, when a specific cause of the fever, having found it in cases of the fever, is yet not accepted by bacteriologists as specific. But the great work, which proved to the world the way of infection of yellow fever, was done by the Commission of the United States, and in the sinking of the Savannah, and certainly proved the transmissibility of the fever through mosquitoes. Sanarelli (1885) prepared an immunizing serum which gave good results; but it was reserved for the future, when a specific cause of the fever, having found it in cases of the fever, is yet not accepted by bacteriologists as specific.

15. Sleeping-Sickness.—Experiments on animals have proved that sleeping-sickness is due to specific germs carried by tse-tse flies from man to man. By means taken to prevent this way of infection, leprosy in human lives have been saved. Among the study of the gland for disease (gole) had been followed by symptoms such as Gull and Ord had described. In 1883 Horsley, by removal of the thyroid gland of monkeys, produced in them a chronic state characterized by a certain disease of the skin and the leprosy. In 1888 the Clinical Society of London
VIZAGAPATAM

published an exhaustive report, of 215 pages, on 115 cases of the disease, giving all historical, clinical, pathological, chemical and experimental facts; but out of 215 pages there is but half a page about treatment, of the useless old-fashioned sort. In 1890 Horsley published the first good account of the thyroid gland from a killed animal should be transplanted beneath the skin of cases of myxoedema: "The justification of this procedure rested on the remarkable experiments of Schill and von Eisselberg. I only became acquainted with the experiments of Mr. Bichat..."

and the interval was... It had done forestalled in 1889 by Dr. Bircher in Aarau. Kocher had tried to do the same thing in 1883, but the graft was soon absorbed; but each of the second grafts took it again in five cases, and one greatly improved.

In 1893 Neumann published his "Note on the Treatment of Myxoedema by Hypodermic Injections of an Extract of the Thyroid Gland of a Sheep." Later, the gland was administered in food. At present, the thyroid glands of the killed rabbit are used. We could not have a better example how experiments on animals are needed for the advancement of medicine. Now, with little bottles of tablets, men and women are restored to health who had become degenerate in body and mind, disfigured and deformed. The same treatment has given back mental and bodily growth to countless cases of sporadic cretinism. Moreover, the action of the thyroid gland has been made known, as the facts of "internal secretion" have been in part elucidated. (Claude Bernard, speaking of the thyroid, the thymus and the suprarenal capsules, said: "We know absolutely nothing about the functions of these organs; we have not so much as the least imaginable idea how they may possibly because experiments have told us nothing about them, and anatomy, left to itself, is absolutely silent on the subject.")

18. The Action of Drugs.—Even in the 18th century medicine was becoming more and more a science. The great superscription of 1721 "Pharmacopoeia" contains substances that were the regular stock-in-trade of witchcraft. Long after 1721 neither clinical observation, nor anything that might be said about a reasonable understanding of the action of drugs: it was the physicians who configured the world, more than the physicians, who worked the thing out: Bichat, Magendie, Claude Bernard. Magendie's study of upas and strychnine, Bernard's study of curare and digitalis, revealed the selective action of drugs: the direct influence of strychnine on the central nerve-cells, of curare on the terminal filaments of motor nerves. These discoveries may be given how experiments on animals have elucidated the action of drugs, and the list might be made longer: atoxin, belladonna, chloride of calcium, cocaine, chloral, ergot, morphia, salicylic acid, strophantus, the chief diuretics, the chief diaphoretics—all these and many more have been studied to this purpose by this method; but it must suffice to quote here (1) Sir Thomas Fraser's account of digitalis, and (2) Sir Thomas Lauder Brunton's account of nitrate of amyl.

19. Digitalis was introduced as a remedy for dropsy; and on the applications which were made of it for the treatment of that disease, a slovenly action on the cardiac movements was observed, which led to the relaxing a reputation of a cardiac sedative. . . . It was not until the experiments of Spallanzani, in 1770, in poison, in the first instance by Claude Bernard, and subsequently by Dubowskii, Pelikan, Meyer, Böhm and Schmielebe, that the action of digitalis upon the heart was discovered. It was shown that the effects upon the circulation were not in any exact sense sedative, but, on the contrary, stimulant and tonic, rendering the action of the heart more powerful, and increasing the force of the venous vessels. All these indications of digitalis disease were thereby revolutionized, and at the same time rendered more exact; and the striking benefits which are now afforded by the use of this substance in most (cardiac) diseases were made available to humanity.

2. In the spring of 1895 I had opportunities of constantly observing a patient who suffered from angina pectoris, and of obtaining from him numerous sphygmographic tracings both during the attack and during the interval. These showed that during the attack the pulse became quicker, the blood-pressure rose and the arteries contracted. . . . It occurred to me that if it was possible to diminish the tension, instead of increasing it, the pain would be removed. I knew from unpublished experiments on animals by Dr. A. Gamgee that nitrate of amyl had this power, and therefore tried it on the patient. My expectations were perfectly answered.

19. Snake Venom.—Sewall (1878) showed that animals could be immunized, by repeated injection of small doses of rattlesnake's venom, against the venom of the same species. Dr. A. Fletcher recently reported experiments on the immunity of animals against cobra venom: afterward Fraser, Calmette and many others worked at the subject. Fraser's work on the anti- cobra serum of sheep and other animals is of the very highest interest and value, both in physiology and in therapy. Canada's work is an admirable instance of the delicacy and accuracy of the experimental method. The different venoms were measured in milligrams, the animals inoculated with bodies-weights of the animals inoculated; but of course this estimate of virulence was checked according to the susceptibility of the animals; guinea-pigs, rabbits and especially rats being more susceptible than dogs.

"The following table gives the relative toxicity, for 1 kilogramme of rabbit, of the different venoms that I have tested":

| Venom of Naja | 0.25 milligramme per kilogramme of rabbit kills 4000 kilogrammes of rabbit: activity 1,000,000. |
| 1. Venom of Naja | 0.25 milligramme per kilogramme of rabbit kills 4000 kilogrammes of rabbit: activity 1,000,000. |
| 2. Venom of Hopsiphasus | 0.25 milligramme per kilogramme of rabbit kills 3500 kilogrammes of rabbit: activity 700,000. |
| 3. Venom of Pseudoscidae | 0.25 milligramme per kilogramme of rabbit kills 3000 kilogrammes of rabbit: activity 600,000. |
| 4. Venom of Pseudoscidae | 0.25 milligramme per kilogramme of rabbit kills 2500 kilogrammes of rabbit: activity 500,000. |

By experiments in vitro Calmette studied the influence of heat on these venoms. Whether one could cool off and, working by various methods, was able to immunize animals: "I have got to immunizing rabbits against doses of venom that are truly colossal. I have several, vaccinated more than a year, and that have not succumbed to venom doses of 25 to 50 milligrammes of venom of Naja tripudians at once. Five drops of serum from these rabbits wholly neutralize in vitro the toxicity of one milligramme of Naja venom. . . . It is not even necessary that the serum should come from an animal vaccinated against the same sort of venom as that in the mixture. The serum of a rabbit immunized against the venom of the cobra or the vipers acts differently on all the venoms that I have tested."

In 1895 he prepared a curative serum: "If you if you inoculate a rabbit with such a dose of venom as kills the control-animal in a few hours; and then, an hour after injecting the venom, inject lender that skin of the abdomen four to five cubic centimetres of serum, recovery is the rule. When you interfere later than this, the results are uncertain; and out of all my experiments the death at an hour and a half is the most that I have been able to reach."

In 1896 four successful cases were reported in the British Medical Journal. In 1896 Calmette reports:—

sir: "That was the use of my antivenous serum was introduced in India, in Algeria, in Egypt, on the West Coast of Africa, in America, in the West Indies, Antilles, &c. It has been very often used for men and domestic animals (dogs, horses, oxen), and even to none of those that have been received an injection of serum have succumbed. A great number of observations have been communicated to me, and not one of them refers to a case of failure" (Brit. Med. Journ., May 14, 1896; see also Boston Medical and Surgical Journal, April 7, 1896).

It is of course impossible that "antivenom" should be always at hand, or that it should bring about any great decrease in the higher degree of death, that is involved in the snake, but in India alone are annually; but at least something has been accomplished with it.

The account given above of the chief discoveries that have been made by the help of experiments on animals, in physiology, pathology, bacteriology and therapeutics, might easily have been lengthened if we added to it other methods of treatment that one less, but yet over something, to these experiments. Nevertheless, the facts quoted in this article are sufficient to indicate the great debt that medicine owes to the employment of vivisection.

VIZAGAPATAM, a town and district of British India, in the Madras presidency. The town stretches 3 m. along the coast, and has a station on a short branch of the East Coast railway, 484 m. N.E. of Madras Pop. (1901) 40,892. It lies on a small bay, the south extremity of which is bounded by a promontory known as the Dolphin's Nose, and its northern extremity by the suburb of Waltair. The town or fort, as it is called, is separated from the Dolphin's Nose by a small river, which forms a bar which it enters the sea, but is passable for vessels of 300 tons during spring tides. An English factory was established here early in the 17th century, which was captured by the French in 1757, but shortly afterwards recovered. The town owes much to the munificence of the neighbouring raja of Vizianagram. A water supply has been provided at a cost of £50,000. Waltair is the European quarter. There is a considerable Roman Catholic population and a branch of the London Mission. The exports by sea include manganese ore, rice and sugar. Some weaving and bleaching is carried on, and there is a specialty of ornamental boxes, &c., carved out of sandalwood, horn, ivory, porcupine quills and silver.

The District of VIZAGAPATAM has an area of 17,722 sq. m., being one of the largest districts in India. It is a picturesque and hilly country, but for the most part unhealthy. The surface is generally undulating, rising towards the interior, and crossed by streams, which are dry except during the rainy season. The main portion is occupied by the Eastern Ghats. The slopes of these mountains are clothed with luxuriant
VIZELTELY—VLAARDINGEN

165

vegetation, amid which rise many tall forest trees, while the bamboo grows profusely in the valleys. The drainage on the east is carried by numerous streams direct to the sea, and that to the west flows into the Godavari through the Indravati or through the Sabari and Siller rivers. To the west of the range is situated the greater portion of the extensive zamindari of Jaipur, which is for the most part very hilly and jungly. In the extreme north a remarkable mass of hills, called the Nimghir, rise to a height of 900 ft. The plain along the Bay of Bengal is a vast sheet of cultivation, green with rice fields and greens of sugar-cane and tobacco, and great varieties of climate in the district. Along the coast the air is soft and relaxing, the prevailing winds being south-easterly. The average annual rainfall at Vizagapatam exceeds 40 in. Pop. (1901) 2,033,650, showing an increase of 4.7% in the decade. The principal crops are rice, millets, pulses and oil-seeds, with some sugar-cane, cotton and tobacco. The coast portion of the district is traversed throughout by the East Coast railway, opened from Madras to Calcutta in 1904; and a line through the hills from Vizianagram to Raipur in the Central Provinces has been sanctioned. The chief seaports are Bimilipatam and Vizagapatam.

On the dissolution of the Mogul empire Vizagapatam formed part of the territory known as the Northern Circars, which were ceded to the East India Company by treaties in 1765 and 1766. It was long before British authority was established over the hilly tract inland, inhabited by aboriginal tribes, and still administered under a peculiar system, which vests in the collector the powers of a political agent. This tract, forming more than two-thirds of the whole district, is known as the Agency.

The Vizagapatam District Gazetteer (Madras, 1907).

VIZETELLY, HENRY (1820-1894), English publisher, was born in London on the 30th of July 1820, the son of a printer. He was early apprenticed as a wood engraver, and one of his first blocks was a portrait of "Old Parr." Encouraged by the success of the Illustrated London News, Vizetelly in 1843, with his brother James Thomas Vizetelly (1817-1897) and Andrew Spottiswoode (1756-1860), started the Pictorial Times, which was published successfully for several years. In 1853, in partnership with Boyne, he started a threepenny paper called the Illustrated News, which four years later was merged in the Penny Illustrated Paper. In 1865 Vizetelly became Paris correspondent for the Illustrated London News. During the years he remained in Paris he published several books—Paris in Peril (1852), The Story of the Diamond Necklace (1867) and a free translation of Topin's Man in the Iron Mask. In 1872 he was transferred to Berlin; where he wrote Berlin under the New Empire (1879). In 1887 he established a publishing house in London, issuing numerous translations of French and Russian authors. In 1888 he was prosecuted for publishing a translation of Zola's La Terre, and was fined £100 and when he reissued Zola's works in 1889 he was again prosecuted, fined £500 and imprisoned for three months. In 1893 he wrote a volume of autobiographical reminiscences called Glances Back through Seventy Years, a graphic picture of literary Bohemia in Paris and London between 1840 and 1870. He died on the 1st of January 1894. His younger brother, Frank Vizetelly (1830-1883), was a clever artist and journalist; he went to Egypt as war correspondent for the Illustrated London News and was never heard of after the massacre of Hicks Pasha's army in Kordofan.

VIZIADURG, Vijnadurg or Gheria, a port on the W. coast of India in Ratnagiri district, Bombay, 770 m. S. of Bombay city. Pop. (1901) 2,339. It is one of the best harbours on the west coast, being without any bar, and may be entered in all weathers; even to large ships it affords safe shelter during the south-west monsoon. At the beginning of the 18th century the pirate chief Angria made Vizadurdur the capital of a territory stretching for 150 m. along the coast and from 30 to 60 m. inland. The fort was taken by Admiral Watson and Captain Wager in 1756.

VIZIANAGRAM, a town of British India, in the Vizagapatam district of Madras, 17 m. from the seaport of Bimilipatam, on the East Coast railway, 522 m. N.E. of Madras. Pop. (1901) 37,270. It has a small military cantonment. It contains the residence of a zamindar of the same name, who ranks as the first Hindu nobleman of Madras. His estate covers about 3,000 sq. m., with a population of 900,000. The estimated income is £180,000, paying a permanent land revenue of £34,000. The town possesses many fine buildings, entirely supported by the raja. It has a college and two high schools.

The ruling family, which claims descent from a high official at the court of Golconda, established itself in Vizagapatam in the 17th century. In 1754 Vizianarama Raz made an alliance with the French, but his son, on succeeding, fell out with them, captured Vizagapatam from them and ceded it to the British in 1758. The next raja, another Vizianaram, was entirely under the influence of his half-brother Sita Ram, whose power, however, became so great a menace that he was forced to retire in 1793. A period of decay now set in. The raja was incompetent, and his estate having been sequestered for debt, revolted and was defeated and killed in 1794. The next raja, Narayana Babu, was no more successful, and his estate had been long under the management of the British government when he died in 1845. Vizianarama Gajapati Raz, who succeeded him and took over full powers in 1852, was a man of ability, and received the titles of maharaja and K.C.S.I.; as also was his son, the maharaja Ananda Raz, G.C.I.E. He died in 1897, and was succeeded by Raja Pusapati Vizianarama Gajapati Raz, during whose minority (till 1904) the estate was again under government administration.

VIZIER, more correctly VIZIR (Arabic Wazir), literally "burden-bearer" or "helper," originally the chief minister or representative of the Abbasid caliphs. The office of vizier, which spread from the Arabs to the Persians, Turks, Mongols, and other Oriental peoples, arose under the first Abbasid caliphs (see MAHOMMEDAN INSTITUTIONS, and CALIPHATE, C § 1) and took shape during its tenure by the Barmecides (q.v.). The vizier stood between sovereign and subjects, representing the former in all matters touching the latter. This withdrawal of the head of the state from direct contact with his people was unknown to the Omayyads, and was certainly an imitation of Persian usage; it has even been plausibly conjectured that the name is but the Arabic adaptation of a Persian title. In modern usage the term is used in the East generally for any important official under the sovereign.

VIZZOLA TICIINO, a village of Lombardy, Italy, in the province of Milan, 6 m. W. of Gallarate and 31 m. N.W. of Milan, 725 ft. above sea-level. Pop. (1901) 469. It is situated on the Ticino, and is remarkable as having one of the largest electric works in Europe, worked by water-power from the Ticino brought by a canal 41 m. long, constructed in 1889-91 by the Societa Lombarda per Distribuzione di Energia Elettrica. Gallarate, Sesto Calendone, Sarzano and other neighbouring places are supplied from here with electricity.

VLAARDINGEN, a river port of Holland, in the province of South Holland, on the Maas, 6 m. by rail W. of Rotterdam. Pop. 17,000. A very old town and the seat of a former marquavate belonging to the counts of Holland. Vlaardingen is now chiefly important as the centre of the great herring and cod fisheries of the North Sea. Its only ornaments are the old market-place and the gardens formed by the purchase in 1825.
VLACHS

of a seat called the Hof. The chief industries are those connected with the large fishing trade.

VLACHS. The Vlachs (Vlakh, Wallach) or Ruman race constitutes a distinct division of the Latin family of peoples, widely disseminated throughout south-eastern Europe, both north and south of the Danube, and extending sporadically from the Russian river Bug to the Adriatic. The total numbers of the Vlachs may be estimated at 10,000,000 or 17,000,000. North of the Danube, 5,400,000 dwell in Rumania; 1,250,000 are settled in Transylvania, where they constitute a large majority of the population; and there are others in Wallachia and Moldavia, and in other Hungarian districts west and north of Transylvania. Close upon 1,000,000 inhabit Bessarabia and the adjoining parts of south Russia, and about 230,000 are in the Austrian province of Bukovina. South of the Danube, about 500,000 are scattered over northern Greece and European Turkey, under the name of Kutzovo-Vlachs, Tzintzars or Aromani. In Servia this element is preponderant in the Timok valley, while in Istria it is represented by the Cici, at present largely Slavonized, as are now entirely the kindred Morlachs of Dalmatia. Since, however, the Vlachs have made a partial adaptation to the climate and race of the surrounding peoples, and have intermarried with them, the points of similarity between them and the Slavonic races are so closely connected, the figures given above can only be regarded as approximately accurate; and some writers place the total of the Vlachs as low as 9,000,000. It is noteworthy that the Romans north of the Danube continually gain ground at the expense of their neighbours; and even the long successful Greek propaganda among the Kutzovo-Vlachs were checked after 1865 by the labours of Apostolou Margaritis and other nationalists.

A detailed account of the physical, mental and moral characteristics of the Vlach race, its modern civilization and their historical development, will be found under the headings RUMANIA and MACEDONIA.

All divisions of the race prefer to style themselves Romani, Romeni, Rumeni or Aromani; and it is from the native pronunciation of this name that we have the equivalent expression Ruman, a word which must by no means be confined to that part of the Vlach race inhabiting the present kingdom of Rumania.

The name "Vlachs," applied to the Romans by their neighbours but never adopted by themselves, appears under many spellings and forms, the Slavs saying Volach or Wolach, the Greeks Vlachoi, the Magyars Olóh, and the Turks, at a later date, Ilbök. In its origin identical with the English Weolh or Welsh, it represents a Slavonic adaptation of a generic term applied by the Teutonic races to all Roman provincials during the 4th and 5th centuries. The Slavs, at least in their principal extent, first knew the Roman empire through a Teutonic medium, and adopted their term Volokh from the Ostro-Gothic equivalent of the Anglo-Saxon Wealh. It thus finds its analogies in the German name for Italy—Welschland (Wälschland), in the Walloons of the Low Countries and the Waldegg of Tirol. An early instance of its application to the Roman population of the Eastern empire is found (c. 550-600) in the Traveller's Song, where, in a passage which in all probability connects itself with the early trade-route between the Baltic staple of Wollin and Byzantium, the gleeman speaks of Caesar's realm as Walairic, "Welschry." In verse 140 he speaks of the Rum-ulvas, and it is to be observed that Rum is one of the words by which the Vlachs of eastern Europe still know themselves.

The Vlachs claim to be a Latin race in the same sense as the Spanish or Italians—Latin by language and culture, and, in a smaller degree, by descent. Despite the long predominance of Greek, Slavonic and Turkish influence, there is no valid objection to this claim, which is now generally accepted by competent ethnologists.

The language of the Vlachs is Latin in structure and to a great extent in vocabulary; their features and stature would not render them conspicuous as foreigners in south Italy; and that their ancestors were Roman provincials is attested not only by the names "Vlach" and "Ruman" but also by popular and literary tradition. In their customs and folk-lore both Latin and Slavonic traditions assert themselves. Of their Roman traditions the Trojan saga, the celebration of the Latin festivals of the Rosalia and Kalendae, the belief in the striga (witch), the names of the months and days of the week, may be taken as typical examples. Some Roman words connected with the Christian religion, like biserica (basilica) = a church, botes = botez, duminita = Sunday, prot (presbytery) = priest, point to a continuous tradition of the Illyrian church, though most of their ecclesiastical terms, like their liturgy and their church architecture, are of Slavonic origin. In most parts of the country, where political organization the Slavonic element is also preponderant, though there are words like imprimat = imperator, and domn = dominus, which point to the old stock. Many words relating to kinship are also Latin, some, like vitrigr (vitrigro) = father-in-law, being alone preserved by this branch of the Romance family. But if the Latin descent of the Vlachs may be regarded as proven, it is far less easy to determine their place of origin and to trace their early migrations.

The centre of gravity of the Vlach or Ruman race is at present undoubtedly the Danube in the almost circular territory between the Danube, the Theiss, and the San, and corresponds roughly with the Roman province of Dacia, formed by Trajan in A.D. 106. From this circumstance the popular idea has arisen that the race itself represents the descendants of the Romanized population of Trajan's Dacia, which was assumed to have maintained an unbroken existence in Walachia, Transylvania and the neighbour provinces, beneath the dominion of a succession of invaders. The Vlachs of Pindus, and the southern region generally, were, on this hypothesis, to be regarded as later immigrants from the lands north of the Danube. In 1871, E. R. Roessler published at Leipzig, in a collective form, a series of essays entitled Romanische Studien, in which he absolutely denied the claim of the Rumanian and Transylvanian Vlachs to be regarded as autochthonous Dacians. He laid stress on the statements of Vopscus and others as implying the total withdrawal of the Roman provincials from Trajan's Dacia by Aurelian, in A.D. 272, and on the non-mention by historians of a Latin population in the lands on the left bank of the lower Danube, during their successive occupation by Goths, Huns, and Avars by J. L. P. Riesius, Professor at Kuffel, and other writers. He found the first trace of a Roman settlement north of the Danube in a Transylvanian diploma of 1222. Roessler's thesis has been generally regarded as an entirely new departure in critical ethnography. As a matter of fact, his conclusions had to a great extent been already anticipated by F. J. Sulzer in his Geschichte des Transsilvanischen Dacians, published in Vienna in 1781, and at a still earlier date by the Dalmatian historian G. Lusco (Lucius of Traul) in his work De Regno Dalmatiae et Croatica, Amsterdam, 1666.

The theory of the late immigration of the Romans into their present abodes north of the Danube, as stated in its most extreme form by Roessler, commanded wide acceptance, and in Hungary it was politically utilized as a plea for refusing parity of treatment to a race of comparatively recent intruders. In Rumania itself Roessler's views were respected as an attack on Ruman nationality. Outside Rumania they found a determined opponent in Dr J. Jung, of Innsbrucker, who upheld the continuity of the Roman provincial stock in Trajan's Daca, disputing from historic analogies the total withdrawal of the provincials by Aurelian; and the reaction against Roessler was carried further by J. L. P. Riesius, Professor at Jassy, B. F. Hasdeu, D. Oniciu, and many other Rumanian writers, who maintain that, while their own race north of the Danube represents the original Daco-Roman population of this region, the Vlachs of Turkey and Greece are similarly descended from the Moeso-Roman and Illyro-Roman inhabitants of the provinces lying south of the river. On this theory the entire Vlach race occupies almost precisely the same territories to-day as in the 3rd century.
On the whole it may be said that the truth lies between the two extremes. Roessler is no doubt so far right that after 272, and throughout the early middle ages, the bulk of the Ruman people lay south of the Danube. Pici's view that the population of the Roman provinces of Moesia and Illyria were Hellenized rather than Romanized, and that it is to Trajan's Dacia alone that we must look for the Roman source of the Balkans, is correct, though we know of the Latinizing of the Balkan lands from inscriptions, martyrologies, Procopius's list of Justinian's Illyrian fortresses and other sources. This Roman element south of the Danube had further received a great increase at the expense of Trajan's colonial foundation to the north when Aurelian established his New Dacia on the Moesian side of the river. On the other hand, the analogy supplied by the withdrawal of the Roman provincials from Riparian Noricum tells against the assumption that the official withdrawal of the Roman colonists of Trajan's Dacia by Aurelian entailed the entire evacuation of the Carpathian regions by their Latin-speaking inhabitants. As on the upper Danube the continuity of the Roman population is attested by the Vici Romanisi of early medieval dialogues and by other traces of a Romanic style still represented by the Ladines of the Tirol, so it is reasonable to suppose a Latin-speaking population continued to exist in the formerly thickly colonized area embracing the present Transylvania and Little Walachia, with adjoining Carpathian regions. Even as late as Justinian's time (483-565), the official connexion with the old Dacian province was not altogether severed. The names of some of certain fortified posts on the left bank of the lower Danube.

We may therefore assume that the Latin race of eastern Europe never wholly lost touch of its former trans-Danubian strongholds. It was, however, on any showing greatly diminished there. The open country, the broad plains of what is now the Rumanian kingdom, and the Banat of Hungary were in barbarian occupation. The centre of gravity of the Roman or Romance element of Illyricum had now shifted south of the Danube. By the 6th century a large part of Thrace, Macedonia and even of Epirus had become Latin-speaking.

What had occurred in Trajan's Dacia in the 3rd century was consummated in the 6th and 7th throughout the greater part of the South-Illyrian provinces, and the Slavonic and Avar conquests severed the official connexion with eastern Rome. The Roman element was uprooted from its fixed seats, and swept hither and thither by the barbarian food. Nomadism became an essential of independent existence, while large masses of homeless provincials were dragged as captives in the train of their conquerors, to be distributed in service colonies. They which hung on the confines of the barbarian首席 Slav, Avar and Bulgarian—to trans-Danubian and Pannonian regions. In the Acts of St Demetrius of Thessalonica (d. A.D. 306) we find an account of such a Roman colony, which, having been carried away from South-Illyrian cities by the Avar kaghan (prince), and settled by him in the Sirmian district beyond the Save, revolted after seventy years of captivity, made their way once more across the Balkan passes, and finally settled as an independent community in the country inland from Salonica. Others, no doubt, thus transported northwards never returned. The earliest Hungarian historians who describe the Magyar invasion of the 9th century speak of the old inhabitants of the country as Romans, and of the country they occupied as Puscowa Romana; and the Russian Nestor, writing about 1100, makes the same invader fight against Slavs and Vlachs in the Carpathian Mountains. So far from the first mention of the Vlachs north of the Danube occurring only in 1222, as Roessler asserts, it appears from a passage of Nicetas of Chonae that they were to be found already in 1164 as far afield as the borders of Galicia; and the date of a passage in the Niburger Siegelbuch, which mentions the Vlachs, under their leader Ramun, in association with the Poles, cannot well be later than 1200.

Nevertheless, throughout the early middle ages the bulk of the Ruman population lay south of the Danube. It was in the Balkan lands that the Ruman race and language took their characteristic mould. It is here that this new Illyrian Romance first rises into historic prominence. Already in the 6th century, as we learn from the place-names, such as Szeptecasas, Burghaldu, Clisura, &c., given by Procopius, the Ruman language was assuming, so far as its Latin elements were concerned, its typical form. In the somewhat later campaigns of Constantine (387) and Priscus, against the Avars and Slavs, we find the Latin-speaking soldiery of the Eastern emperor making use of such Romance expressions as torna frate! (turn, brother!), or sculea (out of bed) applied to a watch (cf. Ruman a se sculea = Italian coricarsi + ex(-s) privative). Next we find this warlike Ruman population largely incorporated into the Bulgarian kingdom, and, if we are to judge from the names Paganus and Sabinus, already supplying it with rulers in the 8th century. The blending and close contact during this period of the surviving Latin population with the Slavonic settlers of the peninsula impregnated the language with its large Slavonic ingredient. The presence of an important Latin element in Albanian, the frequent occurrence of Albanian words in Rumanian, and the remarkable retention by both languages of a suffix article, may perhaps imply that both alike took their characteristic shapes in the same region. The fact that these peculiarities are common to the Rumanas north of the Danube, whose language differs dialectically from that of their southern brothers, shows that it was this southern branch which did the greatest work in assimilating the Latin elements or breaking up the Slavic barrier, and thus in producing a dominating influence. Migrations, violent transplantation, the intercourse which was kept up between the most outlying members of the race, in its very origin nomadic, at a later period actual colonization and the political influence of the Bulgaro-Vlachian empire, no doubt contributed to propagate these southern linguistic acquisitions throughout that northern area to which the Ruman race had been destined almost imperceptibly to shift its centre of gravity.

Byzantium, which had ceased to be Roman, and had become Romanic, renewed its acquaintance with the outposts of the Latin provincials of Illyricum through a Slavonic medium, and applied to them the name of Vlach, which the Slav himself had borrowed from the Goth. The first mention of Vlachs in a Byzantine source is about the year 976, when Cenedonus (ii. 430) relates the murder of the Bulgaric tsar Samuel's brother "by certain Vlach wayfakers," at a spot called the Fair Oaks, between Castoria and Prespa. From this period onwards the Ruman inhabitants of the Balkan peninsula are constantly mentioned by this name, and we find a series of political organizations and territorial divisions connected with the name of Vlach for a short space, but these are the more important of these, outside the limits of Rumania itself.

1. The Bulgaro-Vlach Empire.—After the overthrow of the older Bulgaric tsardom by Basil Bulgaroktonos (976-1025), the Vlach population of Thrace, Haemus and the Moesian lands passed once more under Byzantine dominion; and in 1185 a heavy tax, levied in kind on the cattle of these warlike mountain shepherds, stirred the Vlachs to revolt against the emperor Isaac Angelas, and under the leadership of their Vlach brothers, they founded a new Bulgaro-Vlachian empire, which ended with Kaliman in 1257. The dominions of these half-Slavonic half-Roman emperors extended north of the Danube over a great part of the lowland Rumania, and during the period that the Vlach population north of the river seems to have been most largely reinforced. The 13th century French traveller Rubruquis speaks of all the country between Don and Danube as Vlach or Blakia.

2. Great Walachia (Марака Вьлаха).—It is from Anna Comnena, in the second half of the 11th century, that we first hear of a Vlach settlement, the nucleus of which was the mountainous region of Bessarabia. Benjamin of Tudela, in the 12th century, is interested in the occurrence of this Great Walachia, then completely independent. It embraced the southern and central ranges of Pindus, and extended over part of Macedonia, thus including the lands through which the Vlachs, in their migrations from the 6th to the 12th centuries, had fixed their abode. After the Latin conquest of Constantinople in 1204, Great Walachia was included in the enlarged despotate of Epirus, but it soon reappeared as an independent principality under its old name, which, after passing under the yoke...
VLADIMIR, ST. (c. 956-1015), grand duke of Kiev and of all Russia, was the youngest son of Svyatoslav I and his mistress Malushka. In 970 he received Great Novgorod as his apanage. On the death of Svyatoslav in 972, a long civil war took place between his sons Yaropolk and Oleg, in which Vladimir was involved. From 977 to 984 he was in Scandinavia, collecting as many of the Viking warriors as he could to recover Novgorod, and on his return marched against Yaropol. On his way to Kiev he sent ambassadors to Ragnvald, prince of Polotsk, to sue for the hand of his daughter Ragnhild. The haughty princess refused to affiance herself to "the son of a bondswoman," but Vladimir attacked Polotsk, slew Ragnvald, and took Ragnhild by force. Subsequently (980) he captured Kiev also, slew Yaropol by treachery, and was proclaimed prince of all Russia. In 981 he conquered the Chervenks cities, the modern Galicia; in 983 he subdued the heathen Yatvyags, terrifyaying their territories between the Samara and Poland; and in 985 he led a fleet along the central rivers of Russia, coming to the Bulgars of the Kama, planting numerous fortresses and colonies on his way. At this time Vladimir was a thoroughgoing pagan. He increased the number of the trebiticha, or heathen temples; offered up Christians (Theodore and Ivan, the proto-martyrs of the Russian Church) on his altars; had eight hundred concubines, besides numerous wives; and spent his whole leisure in feasting and hunting. He also formed a great council out of his boys, and set his twelve sons over his subject principalities. In the year 997, as the result of a consultation with his boys, Vladimir sent envoys to study the religion of the various neighboring nations whose representatives had been urging him to embrace their respective faiths. The result is amusingly described by the chronicler Nestor. Of the Musul- man Bulgarians of the Volga the envoys reported: "there is no gladness among them; only sorrow and a great stench; their religion is not a good one." In the temples of the Germans they saw "no beauty"; but at Constantinople, where the full festival ritual of the Orthodox Church was set in motion to impress them, they found their ideal. We no longer knew whether we were in heaven or on earth, nor had we an idea how to tell it." If Vladimir was impressed by this account of his envoys, he was yet more so by the offer of the emperor Basil II. to give him his sister Anna in marriage. In 988 he was baptized at Kherson in the Crimea, taking the Christian name of Basil out of compliment to his imperial brother-in-law; the sacrament was followed by his marriage with the Roman princess. Returning to Kiev in triumph, he converted his people to the new faith with no apparent difficulty. Crypto-Christians had been numerous in Kiev for some time before the public recognition of the Orthodox faith. The remained of the reign of Vladimir was devoted to good works. He founded numerous churches, including the splendid Dey- zinanny Sobor or "Cathedral of the Tithes" (989), established schools, protected the poor and introduced ecclesiastical courts. With his neighbours he lived at peace, the incursions of the savage Petchenegs alone disturbing his tranquillity. His nephew Svyatpo, son of his brother and victim Yaropol, he married to the daughter of Boleslaus of Poland. He died at Berestova, near Kiev, while on his way to chastise the insolence of his son, Prince Yaroslav of Novgorod. The various parts of his dismembered body were distributed among his numerous sacred foundations and were venerated as relics. The university of Kiev has rightly been named after the man who both civilized and Christianized ancient Russia. His memory was also kept alive by innumerable folk ballads and legends. With him the Varangian period of Russian history ceases and the Christian period begins.

VLADIMIR, a town and fortress of Russia in northern Caucasus, the capital of the province of Terek. Pop. (1900) 40,924. It stands on a plateau, at an altitude of 2,354 ft., on both banks of the Terek, where that river issues from the Darial gorge. It is 434 m. by rail S.E. from Rostov-on-the-Don, and has regular communication with Tiflis (333 m.) by coach through the Darial Pass (Georgian military road) of the Caucasus. Moreover, a line of railway, running eastwards to the Caspian ports of Petrovsk and Baku, connects Vladikavkaz, or rather the station Beshan, 14 m. N. of it, by the Transcaucasian railway, i.e. with Tiflis, Poti and Batum. Russians, Armenians and Jews constitute the bulk of the population, which also contains Ossetes, Chechens, Ingushes and others. There are distilleries and a number of smaller factories. The fort, around which the town has grown up, was built in 1784. The town is an episcopal see of the Orthodox Greek Church.
VLADIMIR—VLADIVOSTOK

169

300 ft. to 450 ft. below the general level, so that the country has a hilly appearance. The western depression of the middle Volga and Oka extends into the east of the government. The Upper Carboniferous limestone, of which it is mostly built up, are overlain by Permian sandstones towards the east, and patches of Jurassic clays—denuded remnants of the Permian massif—towards the western part of the surface. The whole is covered with a thick sheet of boulder clay, considered to be the bottom moraine of the North-European ice-sheets. Many terraces are built by deposits, by extensive lacustrine clays and sands. The geology, especially of the western parts, has been investigated by Professor Nikitin, who has ascertained that under the Glacial and post-Glacial deposits—the lower still—lie the richest both of coal and iron—while in the east and the upper for extinct prehistoric forests occur—Lower Cretaceous deposits and deposits intermediate between the Cretaceous and the Jurassic (Volga deposits). Upper Jurassic (l.l. Oxford) and Upper Carboniferous deposits are also found, and at Gorbatov Permian marls.

The soil is for the most part unfertile, save in the district of Yuriev, where patches of black earth, which have occasioned a good deal of discussion among Russian geologists. Iron ore is widely diffused, and china clay and gypsum are met with in several places. Peat is of common occurrence. Forests cover extensive tracts in the southeast. The climate resembles that of Moscow, but is a little colder, and still more continental: the average yearly temperature at the city of Vladimir is 38°F. (January, 16°; July, 66°).

The Oka flows through the government for 85 m., and is navigable throughout. Of its tributaries, the Klyazma is navigable to Krovov, and even to Vladimir in summer; and timber is floated on the Teza. The soil is as rich in the southern part of Vladimir as in that of Plesheevyevo or Pereyaslavl (5 m. in length) has historical associations. Peter the Great found there during his boyhood his first experiences in navigation. The marshes extend to more than half a million acres.

Vladimir ranks third among the governments of European Russia for manufactures. It has some 500 large factories, which employ over 100,000 persons (one-third women); the principal establishments are cotton, linen and silk mills, dye-works, and rope, paper, cardboard, oil, chemical, machine, glass and iron works, and distilleries. Wood, coal, petroleum and peat are all used for fuel. A distinctive feature of Vladimir is the great variety of petty trades, many of which are cultivated by peasants who still consider their activities as a means of earning money to supplement their allotments. While in some villages almost all the male peasants leave their homes and travel all over Russia as carpenters, masons, iron roof makers, or as peddlers or travelling merchants, other villages have their specialisms. In the district of Mstislav, for example, one-third of the male population are engaged in the manufacture of paper and books. Nearly 30,000 carpenters leave Vladimir every year. Whole villages are engaged in painting sacred pictures or icons; and although the icons are sold at a shilling the hundred, the aggregate trade is valued at £50,000. The iron works of Vladimir (or Suzdal) pictures are sold all over Russia and the Balkan peninsula. In other villages some 1200 men are employed in making sicles, knitting and weaving. The products of the various villages are transported to the towns of Vladimir and Klyazma. The movement of shipping on the Volga and its tributaries and sub-tributaries, the Oka, Klyazma and Teza, is considerable. The principal ports are Murom on the Volga and Krovov and Vyazniki on the Oka. Timber, wood for fuel and manufactured goods are the chief exports.

Numbers of Palaeolithic stone implements, intermingled with bones of the mammoth and the rhinoceros, and still greater numbers of Neolithic stone implements, have been found in the basement, and a great number of burial-mounds belonging to the Bronze and Iron periods, and containing decorations in amber and gold; nearly 200 such burial-mounds are scattered round Lake Pleshcheyev, from the last belonging to the pagan period and some to the early Christian. Coins from Arabia, Bakhara, Germany and Anglo-Saxon lands are found in great quantities. (P. A. K.: J. T. Be.)

VLADIMIR, a town of Russia, capital of the government of the same name known in history as Vladimir-on-the-Klyazma, to distinguish it from Vladimir in Volhynia. It is picturesquely situated on the Klyazma and Lybed, 118 m. by rail E.N.E. of Moscow. Pop. (1884) 18,420; (1900) 32,029. The city is the archiepiscopal see of the Orthodox Greek church. The Lybed divides it into two parts. Extensive cherry orchards occupy the surrounding slopes, and in each is a small watch-tower, with cords drawn in all directions to be shaken by the watch when birds alight. The Kremlin stands on a hill and contains two very old cathedrals—the Uspenskiy (1150; restored in 1891), where all the princes of Vladimir have been buried, and the Dmitrievski (1197; restored in 1834-1835). Several churches date from the 12th century, including one dedicated to the Birth of Christ, in which St Alexander Nevski was buried. The "Golden Gate"—a triumphal gate surmounted by a church—was built by the grand duke Andrei Bogolyubski in 1138.

Vladimir was founded in the 12th century. It first comes into history in 1117, when Andrei Bogolyubski secretly left Vysyhgord—the domain of his father in the principality of Kiev—and migrated to the newly settled land of Suzdal, where he became (1157) grand prince of the principalities of Vladimir, Suzdal and Rostov. In 1242 the principality was overrun by the Mongols under Batu Khan, and he and his successors asserted their suzerainty over it until 1328. During this period Vladimir became the chief town of the Russian settlements in the basin of the Oka, and it disputed the superiority with the new principality of Moscow, to which it finally succumbed in 1328.

In the 17th century it began to decay.

VLADIMIR—VOLHYNSKIY, a town of Russia, in the government of Volhynia, 19 m. N.N.E. of Kharkov, where the frontiers of Russia, Poland and Galicia meet and 500 m. W.N.W. of Kiev. Pop. (1885) 8752; (1897) 9605, three-fourths Jews. Though not mentioned in the annals before 988, Vladimir was probably in existence in the 9th century under the name of Ladomir. In the 10th century it was the capital of the principality of Volhynia. The Tatars and the Lithuanians destroyed it several times, but it always recovered, and only fell into decay in the 17th century. It was finally annexed to Russia after the first division of Poland (1772). The ruins in and near the town include remains of a church supposed to have been built by Vladimir, grand duke of Kiev, in the 10th-11th centuries, and of another built in 1160 by his descendant Mstislav. This latter was apparently very well built, and its length exceeded that of the temple of St Sophia at Kiev. The town contains a good archaeological museum.

VLADIVOSTOK, the chief Russian seaport and naval station on the Pacific Ocean, situated at the southern extremity (43° 27' N. and 135° 25' E.) of the Maritime Province, not far from the point where the government touches both Manchuria and Korea (Cho-sen). It is connected with Khabarovsk (470 m. N.N.E.), the capital of the Amur region, and with Chita in Transbaikalia (1392 m.) via Ninguta, Khabar, Tsetsisak and Khalair. Pop. (1900) 38,000. The town stands on Peter the Great Gulf, occupying the northern shore of one of its horn-like expansions, which the Russians have called the Golden Horn. The depth of the Eastern Bosphorus ranges from 13 to 20 fathoms, and that of the Golden Horn from 5 to 13, the latter affording a spacious harbour. The hills are covered with forests of oak, lime, birch, maple, cork, walnut, acacia, ash, aspen, poplar, elm, apple pear and wild cherry, with a rich undergrowth of the most varied shrubs. Excellent timber is supplied by...
VODENA—VOGEL, SIR J.

170

oak and cedar forests not far off. The climate, however, is severe, as compared with that of corresponding latitudes in Europe. Though standing in almost the same parallel as Marseilles, Vladivostok has an average annual temperature of only 40° F., and, although the gulf itself never freezes, a thin ice-crust forms along the shores in December and remains until April. The town has several handsome buildings, a monument to the Emperor Alexander III (1857), a cathedral museum, an observatory, an Oriental institute (opened in 1890), professional schools, a naval hospital, mechanical and naval works, steam saw-mills and flour-mills. The drawback of Vladivostok is that it has not, and cannot have, a well-developed hinterland, despite the great efforts which have been made by the Russian government to supply the Usuri region (to the north of Vladivostok) with Russian settlers. The town of Vladivostok was founded in 1860–1861, and from 1865 to 1900 was a free port.

VODENA (Turk. and Bulg. Voden, anc. Elesia, q.b.), a city of European Turkey, in the vilayet of Salonica, western Macedonia; at the source of the small river Bistrita, which flows east and south into Lake Yenije, and on the railway from Salonica to Monastir. Pop. (1905) about 25,000, consisting of Turks, Slavs and Greeks. The town stands on a rocky height commanding views of Pindus and Olympus; the approaching slopes are richly wooded, and traversed by picturesque waterfalls, from which the name of Vodena (Slav. voda, water) is probably derived. Vodena is the see of a Greek archbishop, and possesses numerous churches and mosques, besides the Temples and remains of Byzantine and Byzantine buildings. It has manufactures of cotton, hemp, wool and leather, and a large trade in wine, silk cocoons and red pepper.

VODEYSHANKAR, GOWRISHANKAR (1805–1892), native minister of the state of Bhauanagar in Kathiawar, Bombay, was born on the 21st of August 1805, of a family of Nagar Brahmins. He rose from being a revenue officer to be state minister in 1847. His success in this capacity was such that on the death of the reigning chief, in 1870, he was appointed joint administrator in concert with a British official. The experiment was in every respect successful. Under the simple and economical forms used in native states, improvements suggested by British experience were introduced. The land revenue was based on a cash system, the fiscal and customs systems were remodelled and tree planting was encouraged. The town of Bhauanagar received the great boon of the Gowrishankar Waterworks, on which six lakhs of rupees were spent. The Bhauanagar state also warmly pressed for railway communication with the continent of India, and thus began a movement which has spread a network of railway lines over the peninsula of Kathiawar. The British government reversed all these many services of Gowrishankar with the distinction of C.S.I. in 1857. He helped to establish the Rajkumar College at Rajkot, for the education of native princes, and also the Rajasthani Court, which, after settling innumerable disputes between the land-owning classes and the chiefs, has since been abolished. In 1879 Gowrishankar resigned office, and devoted himself to the study of the higher literature of that Vedanta philosophy which through his whole life had been to him a solace and a guide. In 1884 he wrote a work called Svarupanusandhan, on the union of the soul with Deity, which led to a letter of warm congratulation from Max Müller, who also published a short biography of him. In 1887 he put on the robe of the Sanyasi or ascetic, the fourth stage, according to the Hindu Shastras, in the life of the twice-born man, and in this manner passed the remainder of his life, giving above ten hours each day to Vedantic studies and holy contemplation. He died, revered by all classes, in December 1892.

See Javerital U. Jajalk, Gowrishankar Udajyshankar (Bombay, 1889).

VOEY, VODER or VOKEY, the Russian national spirituous beverage. Originally vodka was made almost entirely from rye. Today malt to the extent of 15 to 20% being used to effect saccharification (see Spirits), but at the present day potatoes and maize are the staple raw materials from which this spirit is manufactured, and, as a rule, green rye malt is now used instead of barley. The distillation is conducted by means of live steam in a double still of the "patent" type. Vodka as manufactured contains from 90 to 96% of alcohol, but it is diluted, previous to retailing, to a strength of 40 to 40%. It is illegal to sell it with less than 40% of alcohol.

WERTITUS (Veer), GYBERTUS (1588–1676), Dutch theologian, was born at Heusden, Holland. He studied at Leiden, and in 1611 became pastor of Blymen, whence in 1617 he returned to Heusden. In 1619 he played an influential part in the Synod of Dort, and in 1654 was made professor of theology and Oriental science at Utrecht. Three years later he became pastor of the Utrecht congregation. He was an advocate of the extremest form of Calvinism against the Arminians; but his personal influence was good, and the city of Utrecht perpetuated his memory by giving his name to the street in which he lived.

VOGEL, EDUARD (1829–1896), German traveller in Central Africa, was born at Krefeld on the 7th of March 1829. He studied mathematics and astronomy at Leipzig and Berlin, and in 1850 engaged in astronomical work in London. In 1853 he was chosen by the British government to take supplies to Heinrich Barth, then in the western Sudan; and Vogel met Barth at Kuka in Bornu (1854). During 1854 and 1855 he explored the countries round Lake Chad and the upper course of the Benue. On the 1st of December 1855 he left Kuka for the Nile Valley, and nothing further was heard of him. Several search expeditions were organized to ascertain his fate and to recover his papers; it was not until 1873 that Gustav Nachtigal on reaching Wadai learnt that Vogel had been murdered in that country in February 1856.

See Erinnerungen an einen Versuchten (Leipzig, 1863), by Vogel's sister, E. Polko, and Der Afrikaforscher Eduard Vogel (Hamburg, 1889).

VOGEL, SIR JULIUS (1835–1890), British colonial statesman, son of Albert Leopold Vogel, was born in London on the 24th of February 1835; was educated at University College school, London, and emigrated to Victoria during the exciting years which followed the discovery of goldfields there. He became editor of a newspaper at Maryborough, stood for the Legislative Assembly and was defeated, and in 1861 left Victoria, carried in the mining rush to Otago, New Zealand, where much gold had just been found. Settling in Dunedin, he bought a half-share in the Otago Daily Times, and was soon its editor and a member of the Otago Provincial Council. He made his paper the most influential in the colony, and was returned to the House of Representatives. In 1866 he was head of the Otago Provincial Executive (having in his hand the key to the provincial parliament), and was treasurer in the ministry of Sir William Fox. Without delay he brought forward a scheme for the construction of trunk railways and other public works, the purchase of land from the Maori tribes, and the introduction of immigrants, all to be done with money borrowed in London. At that time New Zealand hardly contained a quarter of a million of white settlers, was exhausted by the ten years' struggle with the Maori, not then ended, and was depressed by the low price of her staple product, wool, and the abatement of a gold-fever. Yet Vogel's sanguine, energetic appeals and remarkable gift of persuasion induced the House of Assembly to adopt a modified version of his scheme. For the next six years he was the most powerful man in the colony. Millions were borrowed, railways were pushed on, immigrants—state and voluntary—streamed in. Lasting peace was made with the Maori, a telegraph line laid to Australia, a steam mail service secured across the Pacific to San Francisco; a government life insurance office, and a public trust office, were established, both of which proved useful and were well-managed. During a visit to London on the colony's financial business, Vogel succeeded in arranging for the bank at the Bank of England, an arrangement afterwards confirmed by the imperial parliament. In 1875 he was knighted.
VOGHERA—VOGLER

In 1874 Vogler, until that time a supporter of the Provincial system, decided to abolish it. In this, with the aid of Sir E. W. Stafford and Sir H. A. Atkinson, he succeeded. In the struggle, however, he broke with many of his old allies, and in 1876 suddenly quit New Zealand to take the post of agent-general in London. This he held until 1880, and while holding it negotiated a loan for five millions. Having become connected with certain public companies, and the New Zealand government objecting thereto, he had to resign his position. An attempt, too, which he made in 1880 to enter the House of Commons as Conservative member for Penryn was unsuccessful. In 1884 he returned to New Zealand, was at once elected to parliament, and in the same year was appointed to the Senate. He held this position until his death in 1895, and it was mainly through his influence that the proposed change in the construction of the organization consisted in simplifying the mechanism, introducing free-reeds in place of ordinary reed-stops, and substituting unisonous stops for the great "mixtures" then in vogue. The theoretical system, though professedly based on Valotti's principles, was to a great extent empirical. Nevertheless, in virtue of a certain substratum of truth which seems to have underlain his new theories, Vogler undoubtedly exercised a powerful influence over the progress of musical science, and numbered among his disciples the majority of the great organists of the day.

In 1778 the elector removed his court to Munich. Vogler followed him thither in 1780, but, dissatisfied with the reception accorded to his dramatic compositions, soon quitted his post. He went to Paris, where after much hostility his new system was recognized as a continuation of that started by Rameau. His organ concerts in the church of St Sulpice attracted considerable attention. At the request of the queen, he composed the opera Le Patriote, which was produced before the court at Versailles. His travels were wide, and extended over Spain, Greece, Armenia, remote districts of Asia and Africa, and even Greenland, where he received a warm welcome. In 1786 he was appointed "kapellmeister" to the king of Sweden, founded his second music school at Stockholm, and attained extraordinary celebrity by his performances on an instrument called the "orchestron"—a species of organ invented by himself. In 1790 he brought this instrument to London, and performed upon it with great effect at the Pantheon, for the concert-room of which he also constructed an organ upon his own principles. The abbé's pedal-playing excited great attention. His most popular pieces were a fugue on themes from the "Für Elise" and the "Carmen," composed after a visit to Handel's festival at Westminster Abbey, and A Musical Picture for the Organ, by Knecht, containing the imitation of a storm.

From London Vogler proceeded to Rotterdam and the chief towns on the Rhine. At Esslingen he was presented with the "wine of honour," reserved for the use of sovereigns. At Frankfort he attended the coronation of the emperor Leopold II. He then visited Stockholm, and after a long residence there, interrupted by endless wanderings, once more established himself in Germany, where his compositions, both sacred and secular, enjoyed uninterrupted forms of national man. He was heard of in Berlin in 1800, at Vienna in 1804 and at Munich in 1866. While at Frankfort in 1807 he received an invitation from Louis I., grand duke of Hesse-Darmstadt, offering him the appointment of "kapellmeister," with the order of merit, the title of privy councillor, a salary of 3000 florins, a house, a table supplied from the duke's own kitchen, and other privileges, which determined him to bring his wanderings at last to a close.

At Darmstadt he opened his third and most famous music school, the chief ornaments of which were Gängbacher, Weber and Meyerbeer, whose affection for their old master was unbounded. One of Vogler's latest exploits was a journey to Frankfort in 1810, to witness the production of Weber's Sylva. He continued to work hard to the last, and died suddenly of apoplexy at Darmstadt on the 6th of May 1814. He was a

1 Robert Browning's poem on "Abt Vogler extemporizing on an instrument of his own invention" has made his name familiar to the literary public.
brilliant and accomplished performer, and an excellent if an eccentric teacher; but his own compositions have not survived.

Vogt, Karl Christoph (1817-1859), German naturalist and geologist, was born at Giessen on the 5th of July 1817. In 1847 he became professor of zoology at Giessen, and in 1852 professor of geology and afterwards also of zoology at Geneva, where he died on the 5th of May 1859. His earlier publications were on zoology; he dealt with the Amphibia (1839), Reptiles (1840), with Moluscus and Crustacea (1845) and more generally with the invertebrata fauna of the Mediterranean (1854).

His separate works include Im Gebirg und auf den Gletschern (1836); Physiologische Briefe (1845); Grundzüge der Geologie (1860); and Lehrbuch der Geologie und Petrographie (2 vols., 1846-47; ed. 4, 1879). An English version of his Lectures on Man: his Place in Creation and in the History of the Earth was published by the Anthropological Society of London in 1844.

Vogtland, or Vogtland, a district of Germany, forming the S.W. corner of the kingdom of Saxony, and also embracing parts of the principality of Reuss and of the duchies of Saxe-Altenburg and Saxe-Weimar. It is bounded on the N. by the principalities of Reuss, in the S.E. by Bohemia, and on the S.W. and W. by Bavaria. Its character is generally mountainous, and geologically it belongs to the Erzgebirge range. It is extremely rich in mineral ores—silver, copper, lead and bismuth. The name denoted the country governed for the election of a Vogt (bailli or steward), and was, in the Middle Ages, known as terra advocatorum. The Vögte are said to have met with in the country in the 10th century, and the office shortly afterwards appears to have become hereditary in the princely line of Reuss. But this house was not in undivided possession, rival claims being raised from time to time; and after being during the middle ages a bone of contention between Bohemia, the burggraves of Nuremberg and the Saxon house of Wettin, it passed gradually to the Wettins, falling by the division of 1485 to the Ernestine branch of the family. The elector Augustus I. was one of the principal cities of his dominions.

Vogué, Eugène Melchor, Comte de (1845–), French author, was born at Nice on the 25th of February 1848. He was educated in Paris, and, on the conclusion of the war entered the diplomatic service, being appointed successively attaché to the legations at Constantinople and Cairo and secretary at St Petersburg. He resided in 1882, and from 1891 to 1898 was deputy for Ardèche. His connexion with the Retour des deux mondes began in 1873 with his Voyage en Syrie et en Palestine, and subsequently he was a frequent contributor. He did much to awaken French interest in the intellectual life of other countries, especially of Russia, his sympathy with which was strengthened by his marriage in 1878 with a Russian lady, the sister of General Annenkow. De Vogué was practically the first to draw French attention to Dostoevski and his successors. He became a member of the French Academy in 1888.

His works include: Histoires orientales (1870); Portraits du siècle (1883); Le Fils de Pierre le Grand (1884); Histoires d’hiver (1885); Retour au royaume (1886); Voyages et littératures (1892); Cœurs russes (1894); Devant le siècle (1896); Jean d’Aigrive (1898); Le Rappel des ombres (1900); Le Maître de la mer (1903); Maxime Gorky (1905).

Voice (Fr. voix, from Lat. vox), the sound produced by the vibrations of the vocal cords, or ligaments or bands of fibrous elastic tissue situated in the larynx. It is to be distinguished from speech, which is the production of articulate sounds intended to express ideas. Many of the lower animals have voice, but none has the power of speech in the sense in which man possesses that faculty. There may be speech without voice, as in whispering, whilst in singing a scale of musical voices we have voice without speech. (See Song; and for speech see Phonetics; also the articles on the various letters of the alphabet.)

1. Physiological Anatomy.—The organ of voice, the larynx, is situated in man in the upper and fore part of the neck, where it forms a well-known prominence in the middle line (see details under RESPIRATORY SYSTEM). It opens below into the trachea or wind-pipe, and above into the cavity of the pharynx, and it consists of a framework of cartilages, suited by elastic membranes or ligaments, two of which constitute the true vocal cords. These cartilages are movable on each other by the action of various muscles, which thus regulate the position and the tension of the vocal cords. The trachea conveys the blast of air from the lungs during expiration, and the whole apparatus may be compared to an acoustical contrivance in which the lungs represent the wind chest and the trachea the tube passing from the wind chest to the sounding body contained in the larynx. Suppose two tight bands of any elastic membrane, such as thin sheet india-rubber, stretched over the end of a wide glass tube so that the margins of the bands touched each other, and that a powerful blast of air is driven through the tube by a bellows. The pressure would so distend the margins of the membrane as to open the aperture and allow the air to escape; this would cause a fall of pressure, and the edges of the membrane would spring back by their elasticity to their former position; again the pressure would increase, and again the edges of the membrane would be distended; and those vibrations would be so quickly repeated as to cause the edges of the membrane to vibrate with sufficient rapidity to produce a musical tone, the pitch of which would depend on the number of vibrations executed in a second of time. In other words, there would be a rapid succession of puffs of air. The condensation and rarefaction of the air thus produced are the chief cause of the tone, as H. von Helmholtz has pointed out, and in this way the larynx resembles the siren in its mode of producing tone. It is evident also that the intensity or loudness of the tone would be determined by the amplitude of the vibrations of the margins of the membrane, and that its pitch would be affected by any arrangement effecting an increase or decrease of the tension of the margins of the membrane. The pitch might also be raised by the strength of the current of air, because the great amplitude of the vibrations would increase the mean tension of the elastic membrane. With tones of medium pitch, the pressure of the air in the trachea is equal to that of a column of mercury of

160 mm.; with high pitch, 6250 mm.; and with notes of very high pitch, 945 mm.; whilst in whispering it may fall as low

FIG. 1.

FIG. 2.
as that represented by 30 mm. of water. Such is a general conception of the mechanism of voice.

The cartilages form the framework of the larynx. They consist of two series of triangular membranes, the arytenoid and the thyro-epiglottic, and of three pairs of (two arytenoids and two cornicula of Santorini and two cornu-cunei of Wrisberg), see figs. 1 and 2. The epiglottis, the cornicula cartilages, the arytenoids and the true vocal cords are composed of yellow or elastic fibro-cartilage, whilst the cartilage of all the others is of the hyaline variety, resembling the cartilage of the articular cartilages.

These cartilages are bound together by ligaments, some of which are seen in figs. 1 and 2, whilst the remainder are represented in fig. 3. The ligaments specially concerned in the production of voice are the inferior thyro-epiglottal ligament, and true vocal cord. These are composed of fine elastic fibres attached behind to the anterior projection of the base of the arytenoid cartilage, and in front to the middle of the angle between the wings or laminae of the thyroid cartilage. They are practically continuous with the lateral crico-thyroid ligaments, 6 in fig. 3.

The cavity of the larynx is divided into an upper part, by the narrow aperture of the glottis or chink between the edges of the true vocal cords, the rima glottidis. Immediately above these are the arytenoid cartilages, and behind them is the false vocal cords, there is on each side a recess or pouch termed the ventricle of Morgagni, and opening from each ventricle there is a still smaller recess, the laryngeal pouch, which passes for the space of half an inch between the arytenoid cartilage on one side and the thyroid cartilage outside, reaching as high as the upper border of that cartilage at the side of the epiglottis. The ventricles do not permit a free vibration of the true vocal cords. The upper aperture of the glottis is triangular, with front and narrow lateral, cornu-cuneiform cartilages, and also the cushion of the epiglottis, are readily seen in the laryngoscopic picture. The glottis, 6, is seen in the form of a long narrow fissure, bounded by the true vocal cords, B, while above them we have the false vocal cords, G, and between the true and false cords the opening of the ventricle, 7, the rima glottidis, between the true vocal cords, in the adult male measures about 23 mm., or nearly an inch from before back, and from 6 to 12 mm. across its widest part, according to the degree of dilatation. In females and in males before puberty the antero-posterior diameter is about 17 mm. and its transverse diameter about 4 mm.

The vocal cords of the adult male are composed of 15 mm. of cartilage. The vocal cords of the adult female are about 11 mm. vocal cord. (From Mandl.) The arytenoids, at the lower part of the ventricle, 7, which is closely adherent to the upper part of the glottis, is connected with the thyro-arytenoid, or arytenoid, cartilage.

The cartilages of the larynx, in the greater portion of the larynx, are of the columnar ciliated variety, and by the vibratory action of the cilia mucus is driven upwards, but over the true vocal cords the epithelium is squamous. Patches of squamous epithelium are also found in the ciliated tract above the glottis, on the under surface of the epiglottis, on the inner surface of the arytenoid cartilages, and on the free border of the upper or false vocal cords, which do not exist in the living state of the rima glottidis, more especially in the epiglottis. In each laryngeal pouch there are sixty to seventy such glands, surrounded by fat.

We are now in a position to understand the action of the muscles of the voice. If the cords are drawn upwards forming the rima glottidis, they can be tightened and relaxed, or by which they can be approximated or separated. Besides certain muscles—sterno-hyoid, omohyoid, sterno-thyroid and thyro-hyoid—which move the larynx as a whole, there are two sets of muscles which move the cartilages on each other. Some of these are seen in fig. 5. These muscles are (a) the crico-thyroid, (b) the posterior crico-arytenoid, (c) the lateral crico-arytenoid, (d) the thyro-aryteno-tide, and (e) the rathenoid, and (f) the aryteno-epiglottides. Their actions will readily be understood with the aid of the diagrams in fig. 6. (1) The crico-thyroid is a short thick triangular muscle, its fibres passing from the thyroid to the arytenoid cartilage, and in front of the cartilage to the larynx, and in front of the cartilage to the outer border of the thyro-aryteno-tide, and in front of the cartilage to the thyro-arytenoid cartilage. Thus these muscles separate the crico-thyroid and the thyro-epiglottides, and the aryteno-epiglottides. (2) The thyro-aryteno-tides has been divided by anatomists into two parts—one, the thyro-aryteno-tide, and the other, which is muscle, and the other, external, immediately within the ala of the thyro-arytenoid cartilage. Many of the fibres of the aryteno-epiglottides pass from the thyro-aryteno-tide, with a slight curve (concavity inwards) to the processus vocalis at the arytenoid cartilage, whilst others are parallel with the true vocal cords, and when they contract the aryteno-tides are drawn forwards, carrying with them the posterior part of the rima glottidis and relaxing the vocal cords. Thus the rima glottidis are the antagonists of the crico-aryteno-tides. K. F. W. Ludwig has pointed out that certain fibres (portio vocalis) arise from the side of the glottis itself and pass obliquely back to the processus vocalis. These will tighten the parts of the cord in front of the glottis and the parts behind, their points of attachment.

Some of the fibres of the outer part run obliquely upwards from the side of the crico-thyroid membrane, pass through the antero-posterior fibres of the inner portion of the muscle, and finally end in the tissue of the false cord. These fibres have been supposed to render the edge of the cord more prominent. Other fibres inserted into the thyro-epiglottides and inter aryteno-epiglottides may be seen in the laryngoscope. A few passing up into the aryteno-epiglottides may assist in depressing the epiglottis (Quain). (3) The posterior and lateral crico-aryteno-tides muscles have antagonistic action on the aryteno-epiglottides, from the posterior surface of the thyro-aryteno-tide, and passing upwards and downwards are attached to the outer angle of the base of the arytenoid. On the other hand, the larynx is derived from the aryteno-epiglottides from the anterior surface of the aryteno-epiglottides, and passing forwards are attached to the outer angle of the base of the arytenoid. On the other hand, the lateral are from the aryteno-epiglottides from the anterior surface of the aryteno-epiglottides, and passing forwards are attached to the outer angle of the base of the arytenoid. On the other hand, the lateral are from the aryteno-epiglottides from the anterior surface of the aryteno-epiglottides, and passing forwards are attached to the outer angle of the base of the arytenoid. On the other hand, the lateral are from the aryteno-epiglottides from the anterior surface of the aryteno-epiglottides, and passing forwards are attached to the outer angle of the base of the arytenoid.
and thus approximate the cords. (4) The arytenoids pass from the one arytenoid cartilage to the other, and in action these cartilages will be approximated and slightly depressed. (5) The aryteno-epi-
glotideus muscles arise near the outer angles of the arytenoid; their
fibres pass obliquely upwards, decussate and are inserted partly into

Fig. 6.—Diagrams explaining the action of the muscles of the larynx.
The dotted lines show the positions taken by the cartilages and the
two vocal cords by the action of the muscle, and the arrows show
the general direction in which the muscular fibres act. A, Action
cricothyroid: 1, cricothyroid cartilage; 2, arytenoid cartilage;
thyroid cartilage; 4, true vocal cord; 5, thyroid cartilage, new
position; 6, true vocal cord, new position. B, Action of arytenoid;
section of thyroid; 2, arytenoid; 3, posterior border of epi-
glottis; 4, true vocal cord; 5, direction of muscular fibres;
arytenoid, new position; 7, true vocal cord, new position.
C, Action of lateral crico-arytenoid; same description as for A
and B; 8, posterior border of epiglottis, new position; 9, arytenoid
in new position. D, Action of posterior crico-arytenoid; same
description. (From Beaunis and Bouchard.)

2. Physiology of Voice Production.—The vocal cords are
tightened by the action of the crico-thyroid, or, as it might
be more appropriately termed, the thyro-cricoid
muscle. It stretches the thyro-arytenoid ligaments,
the free edges of which, covered by mucous membrane,
form the vocal cords. The adductors of the cords are the
lateral crico-arytenoids, while the posterior crico-arytenoids
are the abductors. The arytenoid muscle brings the cords
together. Many of the fibres of the thyro-arytenoid are inserted
obliquely into the sides of the cord, and in contraction they
tighten the cord by pulling on the edge and making it curved
instead of straight. Some such action is indicated by the
elliptical shape of the rima glottidis in passing from the chest
register to the middle register. Other fibres, however, running
parallel with the cord may tend to relax it in certain circum-
stances. All the muscles except the thyro-cricoid (which is
innervated by the superior laryngeal) receive nerve filaments
from the inferior laryngeal branch of the vagus, the fibres
being derived from the accessory roots. Both the adductor
and adductor nerves come therefore from the inferior laryngeal.
When an animal is deeply anaesthetized stimulation of the
inferior laryngeal nerve causes adduction of the cord, but if
the anaesthesia is slight, then we have adduction. The tonic
contraction of the abductors is stronger than that of the
adductors, so in a state of rest the glottis is slightly open.
The centre of innervation is in the medulla oblongata, and this
is dominated by a centre in the Rolandic region of the cerebral
cortex.

The intensity or loudness of voice depends on the amplitude

of the movement of the vocal cords. Pitch depends on the
number of vibrations per second; and the length, size and
tension of the cords will determine the number of
vibrations. The more tense the cords the higher the pitch,
and the greater the length of the cords the lower will be the
pitch. The range of the human voice is about three octaves—
that is, from f3 (87 vibrations per second) to f1 (768 vibra-
tions). In men, by the development of the larynx, the
cords become more elongated than in women, in the ratio of
3 to 2, so that the male voice is of lower pitch and is
usually stronger. At the age of puberty the larynx
 grows rapidly, and the voice of a boy "breaks" in
consequence of the lengthening of the cords, generally falling an octave in pitch. A similar
change, but very much less in amount, occurs at the same
period in the female. At puberty in the female there is an
increase of about one-third in the size of the glottis, but it is
nearly doubled in the male, and the adult male larynx is
about one-third greater than that of the female. In advanced
life the upper notes of the register are gradually weakened
and ultimately disappear, whilst the character of the voice
also changes, owing to loss of elasticity caused by ossification,
which first begins about middle life in the thyroid cartilage,
then appears in the cricoid, and much later in the arytenoid.
Eunuchs retain the voices of childhood; and by careful train-
ing it is possible in normal persons to arrest the development
of the larynx so that an adult male can still sing the soprano
parts sometimes used in cathedral choirs. The ranges of the
different varieties of voice are shown in the following diagram,
where the dotted lines give the range of certain remarkable
voices, and the figures represent vibrations per second, taking
the middle C of the piano as 256 vibrations per second.

A basso named Gaspard Forster passed from fa to la; the
younger of the sisters Sessi had a contralto voice from do to fa;
the voice of Catalani ranged three and a half octaves; a
much singer, Farinelli, passed from la to re; Nilsson, in Il
Flauto Magico, could take fa; and Mozart states that he heard
in Parma in 1770 a singer, Lucrezia Ajugari, range from sol to
la, which she gave purely, whilst she could execute trills on re.
The latter is the most highly pitched voice referred to in
musical literature, an octave and a half above the highest
ordinary soprano. It will be observed that the lowest note of
Gaspard Forster's voice is not much above the pitch at which
the perception of musical tone begins, and that from this note to the upper note of Lucrezia Ajugari there is a range of nearly six octaves, whilst the extreme range of ordinary voices, from the lowest bass to the highest soprano, is a little over three octaves. It is the first series of six, to the flat, that the range of the true notes for the perception of musical tone is from do,,

to do,, or from about 32 to 33,768 vibrations per second—
eleven octaves.

3. The Voice Registers.—The voice has been divided by writers into three registers—the lower or chest, the middle and the small or head register. In singing, the voice changes in volume and in quality in passing from one register into another. There is remarkable diversity of opinion as to what happens in the larynx in passing through the various registers. There has also been much discussion on the production of falsetto tones. Lehfeldt and Johannes Müller held that a weak blast of air caused only a portion of the cords, as regards length, to vibrate; M. J. Örtel noticed that when a falsetto tone is produced nodal lines are formed in the cords parallel to their edges, an observation supporting the first contention; M. Garcia was of opinion that as the voice rose in pitch into falsetto only the ligamentous edges of the cords vibrated; and W. E. Hodgkinson showed, by dusting finely powdered indigo into the larynx and observing the blue specks with the laryngoscope, that the "best note of the lower register" showed a stripe of the thyroid cartilage in front to a point behind the junction of the ligamentous and cartilaginous portions of the cord." In singing falsetto tones these additional parts are not thrown into action. Some remarkable and instructive photographs obtained by French show that in proceeding from the lowest to the highest notes of the lower register the cords became lengthened by one-eighth of an inch in a contralto singer's larynx; the same singer, in passing into the middle register, showed a shortening of the cords by one-sixteenth of an inch, and another increase of the length of the cords when the middle register was reached.

4. Condition of the Larynx in the Various Registers.—In singing, one can readily observe that the voice may appear to come chiefly from the chest, from the throat or from the head, or it may show the peculiar quality of tone termed falsetto. Authorities differ much in the nomenclature applied to these varieties of the voice. Thus the old Italian music masters spoke of the voice di petto, voce di gola and voce di testa. Madame Seiler describes five conditions, viz. the first series of tones of the chest register, the second series of tones of the chest register, the first series of tones of the false register, the second series of the false register, and the head register. French writers usually refer to two registers only, the chest and the head; whilst Behnke gives three registers for male voices (lower thick, upper thick and upper thin) and five for the voices of women and children (lower thick, upper thick, lower thin, upper thin and small). These distinctions are of more importance practically than as implying any marked physiological differences in the mechanism of the larynx during the production of the tones in the different registers. By means of the laryngoscope it is possible to see the condition of the rima glottidis and the cords in passing through all the range of the voice.

In 1807 Bozini first showed that it was possible to see into the dark cavities of the body by illuminating them with a mirror, and in 1829 W. Babington first saw the glottis in this way. In 1854 Garcia investigated his own larynx and that of other singers, and three years later Türek, and especially J. N. Czernik, perfected the construction of the laryngoscope. In 1883 Lenox Browne and Emil Behnke obtained photographs of the glottis in the living man. The laryngoscope is a small mirror, about the diameter of the rima glottidis, and the cords in passing through all the range of the voice.

In the picture the larynx to be examined in the small mirror at the back of the throat, an image will be seen as in fig. 4. During calm breathing, the glottis is lance-shaped, between the upper and lower cords. A deep inspiration causes the glottis to open widely, and in favourable circumstances one may look into the trachea. When a sound is to be made, the vocal cords are brought close together, either along their whole length, as in fig. 7, or only along the ligamentous portion, the space between the arytenoids being still open, as in fig. 8. Then when the sound begins the

can be thrown from a mouth into the mouth and throat. In the centre of the mirror there is a small hole through which the eye of the observer sees the image in the small mirror at the back of the throat. By placing a second plane mirror in front of the face, an observer can easily see the mechanism of his own larynx.

5. The Quality of the Human Voice depends on the same laws that determine the quality, clang-tint or timbre of the tones produced by any musical instrument. Musical tones are formed by the vibrations of the true vocal cords. These tones may be either pure or mixed, and in both cases they are
strengthened by the resonance of the air in the air-passages and in the pharyngeal and oral cavities. If mixed—that is, give a special character to the sound; and in the case of a vowel tone the pitch does not appear to depend on that of the fundamental tone but on the pitch of the resonance cavity, as adjusted for the sounding of any particular vowel. When vowels to pronounce or sing a vowel the oral cavity must be adjusted to a certain form, and it is only when it has that form that the vowel can be sounded. The nature of vowel tones has been investigated by means of the phonograph by Fleming Jenkin and Ewing, L. Hermann, Pipping, Boeke, Lloyd, McKendrick and others. E. W. Scripture has worked with the grampus. These observers may be ranged in two divisions—those who uphold the theory of relative as opposed to those who contend for the theory of fixed pitch. Assuming that a vowel is always a compound tone, composed of a fundamental and partials, those who uphold the relative pitch theory state that if the pitch of the fundamental is changed the pitch of the partials must undergo a relative change, while their opponents contend that whatever may be the pitch of the tone produced by the larynx, the pitch of the partials which gives quality or character to a vowel is always the same, or, in other words, vowel tones have a fixed pitch. Helmholtz held that all the partials in a vowel tone were harmonic to the fundamental tone, that is that their periods were simple multiples of the period of the fundamental tone. Hermann, however, has conclusively shown that many of the partials to be harmonic to the fundamental. This practically upsets the theory of Helmholtz. The methods by which this problem can be investigated are mainly two. The pitch of the oral cavity for a given vowel may be experimentally determined, or an analysis may be made of the curve-forms of vowels on the wax cylinder of the phonograph or the disk of the gramophone. By such an analysis, according to Fourier's theorem, the curve may be resolved into the partials that take part in its formation, and the intensity of those partials may be thus determined. The observations of Donders, Helmholtz, König and others as to the pitch of vowels give very different results. Greater success has followed the attempts made by Hermann, Boeke, McKendrick, Lloyd and Mareichelle to analyse the curves imprinted on the phonograph. (Examples of such phonograms are given by McKendrick in the article on "Vocal Sounds" in Schäfer's Physiologie, ii. 1228; see also PHONOGRAM.)

The following is an instructive analysis by Boeke of the curves representing the tones of a cornet, and it illustrates the laws that govern the production of quality in such an instrument:

<table>
<thead>
<tr>
<th>Vowels</th>
<th>O U O A I E I EU U</th>

</tr>
</tbody>
</table>
| No. of vibrations | 170 470 940 1536 1920 2304 1024 1536 |}

F. C. Donders has given a third result, differing from each of the above; and there is little doubt that much will depend on the quality of tone peculiar to different nationalities. By means of Koenig's manometric flames with revolving mirror the varying quality of tone may be illustrated: with a pure tone, the teeth in the flame-picture are equal, like the serrations of a saw, whilst usual the tone is mixed with partials which show themselves by the unequal serrations. Thus quality of voice depends, not merely on the size, degree of elasticity and general mobility of the vocal cords, but also on the form of the resonating cavities above, and very slight differences in these may produce striking results.

6. Vowel Tones.—A vowel is a musical tone produced by the vibrations of the vocal cords. The tone produced by the vocal cords is a mixed one, composed of a fundamental and partials, and certain of the partials are strengthened by the resonance of the air in the air-passages and in the pharyngeal and oral cavities. In this respect the quality of the human voice depends on the same laws as those determining the quality or timbre of the tones produced by any musical instrument. The pitch of the note of a musical instrument, however, depends on the pitch of the first or fundamental tone, while the partials are added with greater or less intensity so as to

![Fig. 11.](image1)

![Fig. 12.](image2)
This analysis shows: (1) that the man’s resonance rises slightly (half-semitone) in ascending seven semitones in the middle of his register; (2) that the boy’s resonance rises three semitones in ascending nine semitones in the upper half of his register; and (3) in the mid-register the boy’s resonance is to the man’s at 5:14. Thus, as we sing a vowel in an ascending scale the pitch of the oral cavity slightly changes, or, in other words, the pitch of the resonating cavity for a given vowel may be slightly altered.

It would appear that both theories are partially true; they are not mutually exclusive. The view of Donders that each vowel has an oral cavity of unchangeable and fixed pitch is too exclusive, and, on the other hand, it cannot be denied that each vowel has a predominant partial or predominant partials which give it a definite character, and which must be produced by the oral cavity as a whole, or by the double resonance of portions of the cavity, as suggested by Lloyd. As we sing a vowel in an ascending scale the form of the resonance cavity may slightly change, but not sufficiently to alter the quality of the vowel. Without still detecting the vowel tone. A singer almost instinctively chooses such vowels as best suit the resonating arrangements of his or her voice, and avoids vowels or vowel combinations that would lead to the production of notes of inferior quality.

</tbody>
</table>

This analysis states that the man’s resonance rises slightly (half-semitone) in ascending seven semitones in the middle of his register; that the boy’s resonance rises three semitones in ascending nine semitones in the upper half of his register; and that in the mid-register the boy’s resonance is to the man’s at 5:14. Thus, as we sing a vowel in an ascending scale the pitch of the oral cavity slightly changes, or, in other words, the pitch of the resonating cavity for a given vowel may be slightly altered.

It appears that both theories are partially true; they are not mutually exclusive. The view of Donders that each vowel has an oral cavity of unchangeable and fixed pitch is too exclusive, and, on the other hand, it cannot be denied that each vowel has a predominant partial or predominant partials which give it a definite character, and which must be produced by the oral cavity as a whole, or by the double resonance of portions of the cavity, as suggested by Lloyd. As we sing a vowel in an ascending scale the form of the resonance cavity may slightly change, but not sufficiently to alter the quality of the vowel. Thus we still detect the vowel tone. A singer almost instinctively chooses such vowels as best suit the resonating arrangements of his or her voice, and avoids vowels or vowel combinations that would lead to the production of notes of inferior quality.

**VOIRON,** a town of France in the department of the Isère. Pop. (1901) 12,625. It stands at a height of 190 ft., on the Rhône (a tributary of the Isère). It is a manufacturing town, and contains numerous factories which produce a sort of cloth named after the town, and also silk-weaving factories (2000 looms, with an annual output of eight to nine million yards). There are also paper-making factories in the town. The fine church of St Bruno was built 1864–73 at the expense of the monks of the Grande Chartreuse. Voiron is the starting-point of the steam tramways to St Laurent du Pont, 12 m. (for the Grande Chartreuse), and to Charavines, 10½ m. (for the Lac du Bourget). The town is on the road to Savoy, but in 1355 was exchanged (with the rest of the region between the Rhône and the Isère, watered by the Guiers Mort) by the count with France for Faugency and Gex.

**VOISENEN, CLAUDE HENRI DE FUZÉE,** entered the château of Voisonen near Melun, on the 8th of July 1708. At the age of ten he addressed an epistle in verse to Voltaire, who asked the boy to visit him. From this introduction dated a friendship that lasted for fifty years. Voisenon made his début as a dramatist with L’Heuresse remissemblance in 1728, followed in 1739 by a three-act comedy L’École du monde at the Théâtre Français. This was preceded by a verse prologue, L’Ombre de Molère, and a month later Voisenon produced a criticism on his own piece in Le Retour de l’ombre de Molère. A duel in which he was the aggressor inspired him with remorse, and he entered the priesthood, becoming vicar-general to the bishop of Bourgogne. He received the abbey of Jard, which made no demands on him. He became closely attached to Madame du Châtelet, the mistress of Voltaire (q.v.), and was intimate with Hectore de Caylus and Mademoiselle Quinault. Dutreux was made witty but by no means edifying contributions to the Étrennes de Saint-Jean, the Bals de Bois, &c. In 1744 he produced the Mariages assortis and in 1746 his masterpiece, the Coquette fixée. He lived on terms of the closest intimacy with Charles Simon Favart and his wife. His pen was always at the service of any of his friends, and it was generally supposed, though on insufficient grounds, that he had a considerable share in Favart’s most successful operas. Voisenon had, strange to say, scruples all his life about the incongruity between his way of living and his profession, but he continued to write indelent stories for private circulation, and wrote verses in imitation of Madame du Barry, as he had done for Madame de Pompadour. He was elected to the Academy in 1762. On the disgrace of his patron, the duc de Choiseul, he lost his pensions and honours, but soon recovered his position. He was intimate with the chancellor Maupeou, and was suspected of writing on his behalf in defence of the abolition of the parlement. This and some other incidents brought him into general disgrace. Early in 1775 he retired to the château of Voisenon, where he died on the 22nd of November of the same year.

**VOITURE, VINCENT** (1598–1648), French poet, was the son of a rich merchant of Amiens. He was introduced by a school-fellow, the comte d’Avaux, to Gaston d’Orléans, and accompanied him to Brussels and Lorraine on diplomatic missions. Although a follower of Gaston, he won the favour of Richelieu, and was one of the earliest academicians. He also received appointments and pensions from Louis XIII. and Anne of Austria. He published nothing in book form, but his verses and his prose letters were the delight of the coteries, and were regarded above all as a model and admired more than the work of any contemporary. He had been early introduced to the Hôtel de Rambouillet, where he was the special friend of Julie d’Angennes, who called him her “dwarf king.” His ingenuity in providing amusement for the younger members of the circle ensured his popularity, which was never seriously threatened except by Antoine Godeau, and this rivalry ceased when Richelieu appointed Godeau bishop of Grasse. When the desire of the duc de Montausier nineteen poets contributed to the Guirlande de Julie, which was to decide the much-talked-about question of his faute de paroles. He contributed to a duet of which the quarrel between the Uranistes and the Jobelins arose over the respective merits of a sonnet of Voiture addressed to a certain Uranie, and of another composed by Isaac de Benserade, till then unknown, on the subject of Job. Another famous piece of his of the same kind, La Belle Maliceuse, is less exquisite, but still very admirable, and Voiture stands in the highest rank of writers of vers de société. His prose letters are full of lively wit, and, in some cases, as in the letter to Richelieu’s policy (Letter LXIV.), show considerable political penetration. He ranks with Jean de Balzac as the chief director of the reform in French prose which accompanied that of Malherbe in French verse. Voiture died at the outbreak of the Fronde, which killed the society to which he was accustomed, on the 26th of May 1648.

VOIVODE—VOLCANO

VOIVODE (also Vaiode, Vayode, Wayode, &c., Med. Gr. βασιλεὺς), a title in use among certain Slavonic peoples, meaning literally "leader of an army" (Sl. voi, host, army; "voiditi," to lead), and so applied at various periods and in various eastern European countries to rulers, governors or officials of varying degree. It is best known as the title of the princes of Moldavia and Wallachia. In these states the title remained in use from the earliest times until 1638 in the case of the first state, and until 1716 in that of the second, when it gave way to "Hospodar" (q.v.). During the period of Hungarian domination of Transylvania (1000–1716) it was governed by a voivode as a Hungarian province, the last voivode raising himself to the position of an independent prince. In Poland the title was used of certain administrative officials; Polish historians latinized it by palatinus. At the present day voivode is used, in its original sense of a high military officer, in the Montenegro army, where it corresponds to the general officer in other European armies.

VOKES, the name of a family of English actors. Frederick Mowbray Vokes (1826–1888), the son of a costumier, made his first appearance on the stage in 1834. In 1861 he, his sisters Jessie (1831–1884), Victoria (1833–1894) and Rosina (1835–1894), and Walter Fawdon (Vokes), first as the "Vokes Children" and then as the "Vokes Family," began to perform at music halls and at the pantomimes, and by their agility and humour made the name well known to English and American theatre-goers. Fred Vokes was a man of real inventiveness as well as rare acrobatic skill.

VOLAPUK, the first artificial language (see Universal Language). Although it was suggested that there were materials of practical success, First published in 1880, it was the work of J. M. Schleyer (b. 1839), a south-German priest. Volapük is not, like the earliest attempts of the kind, an a priori language, but is based mainly on English, the rest of the vocabulary being made up from Latin and the Romance languages. The borrowed words are reduced to a monosyllabic form and are often altered in a very arbitrary manner. Thus the name Volapük itself is made up of the two English words, world and speak, the first in the genitive, the three vowels, a, e, i, being used to express the three cases, genitive, dative and accusative respectively; the nominative is expressed by the bare root, and s is added to form the plural. The grammar of Volapük is therefore partly borrowed, like the vocabulary, partly original. Adjectives end in -ik. The persons of the verb are indicated by adding the pronouns of "I," "thou," "he," "we," &c.; the tenses and the passive are indicated by prefixes, the moods by suffixes following the person-endings, many other inflections being used as well, so that the Volapük verb boasts of no less than 305,440 different forms.

Although founded on English, Volapük is mainly German in structure. It gets rid of the German word-order and the irregularities of German grammar, but it is often impossible to understand a Volapük text without thinking in German. The following is a specimen of the language:

Lőfob kemenis valik volo likol, patiko etis pekuliów, kels konfidos Volapük, as bale medas gleitkin netazetanha.

"I love all my fellow-creatures of the whole world, especially those cultivated (ones) who believe in Volapük as (being) one of the greatest means of nations binding.

Here konfido governs the dative just as its German equivalent does, and "cultivated" is used in the sense of the German geistreich.

The history of Volapük has an interest greater than that of the language itself. It has proved (1) that people in general are ready to adopt an artificial language, and (2) that an artificial language is easier to learn than any national language, and supplies an efficient means of communication between those who have no other language in common. Volapük had no special philological merits to recommend it; yet, after a few years' incubation in south Germany, it spread, first to France (about 1885) and then in a few years over the whole civilized world, so that in 1889, when the third Volapük congress met at Paris, there were 283 Volapük societies all over the world, and the total number of Volapük students was estimated at over a million. At this congress every one—even the waiters—spoke Volapük, and the permanent triumph of the language seemed certain. But the year of its zenith was the beginning of a decline even more rapid than its rise. It fell to pieces through dissensions in its own camp, the first cause of which was the opposition of the inventor to those of his disciples who aimed at making the language mainly an instrument of commerce, correspondence, and advocated the greatest possible simplification of grammar and vocabulary. The divergence of views between the inventor and his colleagues became more and more marked; and after the third congress the breach between M. Schleyer and the Volapük Academy (founded at the second congress in 1887) became a definite one: the director of the Academy proposed a totally new scheme of grammar, and other members proposed others, although one of the objects of the foundation of the Academy was the preservation of the integrity of the language. A new director, M. R. Rieterer of St. Petersburg, was elected in 1893; and from this moment the Academy dissociated itself from Volapük and began to construct a new international language, Idiom Neutral (see Universal Languages). (H. Sw.)

VOLCAE, a Celtic people in the province of Gallia Narbonensis, who occupied the district between the Garumna (Garonne), Cerbenna Mons (Cévennes), and the Rhodanus (or even farther to the east in earlier times), corresponding roughly to the old province of Languedoc. They were divided into two tribes, the Arecomici on the east and the Tectosages (whose territory included the coast of Tolosate) on the west, separated by the river Arauris (Hérault) or a line between the Arauris and Orbis (Orbe). The Volcae were free and independent, had their own laws, and possessed the jus Latii. The chief town of the Tectosages was Tolosa (Toulouse); of the Arecomici, Nemausus (Nîmes); the capital of the province and residence of the governor was Narbo Martius (Narbonne). It was said that there was an early settlement of Volcae Tectosages near the Hercynia Silva in Germany; Tectosages was also the name of one of the three great communities of Gauls who invaded and settled in Asia Minor in the country called Galatia.

VOLCANO, an opening in the earth's crust, through which heated material is brought, permanently or temporarily, from the interior of the earth to the surface, where it usually forms a hill, more or less conical in shape, and generally with a hollow or crater at the top. This hill, though not an essential part of the volcanic mechanism, is what is commonly called the volcano. The name seems to have been applied originally to Etna and some of the Lipari Islands, which were regarded as the seats of Hephaestus, a Greek divinity identified with Vulcan, the god of fire in Roman mythology. All the phenomena connected directly or indirectly with volcanic activity are comprised under the general designation of vulcanism or vulcanicity—words which are also written less familiarly as volcanism and volcanicity; whilst the study of the phenomena forms a department of natural knowledge known as vulcanology. Vulcanicity is the chief superficial expression of the earth's internal igneous activity.

It may happen that a volcano will remain for a long period in a state of moderate though variable activity, as illustrated by the normal condition of Stromboli, one of the Lipari Islands; but in most volcanoes the activity is more decidedly intermittent, paroxysms of greater or less violence occurring after intervals of comparative, or even complete, repose. If the period of quiescence has been very protracted, the renewed activity is apt to be exceptionally violent. Thus, Krakatoa before the great eruption of 1883 had been dormant for something like two centuries, and it is believed that the Japanese
VOLCANO

By far the greatest proportion of the vapour is steam, which sometimes occurs almost to the exclusion of other gaseous products. Such, at least, is the usual and probably correct view, though it is opposed by A. Brun, who regards the volcanic vapours as chiefly composed of chlorides with steam in only subordinate amount. In the case of a mild eruption, like that occurring normally at Stromboli, the vapours may be discharged in periodical puffs, marking the explosion of bubbles rising more or less rhythmically from the scathing lava in the volcanic cauldron. S. Wise observed at the volcano of Sangay, in Ecuador, no fewer than 267 explosions in the course of an hour, the vapour here being associated, as is so often the case, with ashes. During a violent eruption the vapour may be suddenly shot upwards as a vertical column of enormous height, penetrating the passing clouds. For a short distance above the vent the superheated steam, in April 1906, a transparent vapour, but it soon suffers partial condensation, forming clouds, which, if not dispersed by winds, accumulate over the mountain. When the vapour is free from ash it forms rolling balls of fleecy cloud, but usually it carries in mechanical association more or less finely divided lava as volcanic dust and ashes, whereby it becomes yellow, brown, or even black, sometimes as foul as the densest smoke. In a calm atmosphere the dust-laden vapour may rise in immense rings with a rotatory movement, like that of vortex-rings. Frequently the vapours, emitted in a rapid succession of jets, form cumulus clouds, and are sometimes accompanied by a sound like a distant rumble. The general atmospheric disturbance is sometimes accompanied by a loud cracking noise, and the air is rendered electric. Sometimes the arrows may be seen, and frequently there is lightning in the sky. The phenomena are often continued for many hours, and the air is rendered electric for several days. The sound of the jet may be heard at a distance of many miles, and in some cases it is observable for several hundred miles.

Volcanic opinions of the atmosphere which endure for weeks and months are not unusual. When a volcano is in an active state, there is a discharge of steam, with quantities of gases, and ashes, sometimes in vast clouds. The phenomena are often accompanied by a loud cracking noise, and the air is rendered electric. Sometimes the arrows may be seen, and frequently there is lightning in the sky. The phenomena are often continued for many hours, and the air is rendered electric for several days. The sound of the jet may be heard at a distance of many miles, and in some cases it is observable for several hundred miles.

The electrical phenomena attending an eruption are often of great intensity and splendour. The dark ash-laden clouds of vapour are shot through and through by volcanic lightning, sometimes in rapid horizontal flashes, then in oblique forked streaks, or again in tortuous lines compared to fiery serpents, whilst the borders of the cloud may be brilliant with electric scintillations, often forming balls and stars of fire. During the great eruption of Krakatoa remarkable phenomena were observed by ships in the Strait of Sunda, luminous balls like "St Elmo's fire" appearing at the mast-heads and the...
yard-arms, whilst the volcanic mud which fell upon rigging and deck was strongly phosphorescent.

Quite distinct from any electrical phenomena is that intermittent reddish glare which is often seen at night in clouds hanging over an active crater, and which is simply a glow due to reflection from the incandescent lava and stones in the volcanic caldron below.

It is called Rush Mud.—The condensation of the vast volumes of steam exhaled during an eruption produces torrents of rain, which, mingling to a greater or less extent with the volcanic ashes, forms a hot muddy stream known in Italy as lava d'acqua and lave di fango, and in South America as naya. Debris of such mud-lava may rush violently down the mountain-side and spread over the neighbouring country with terribly destructive effect, whence they are greatly dreaded by those who dwell at the base of a volcano. The solidified volcanic mud, often mingled with larger fragments of lava, is known as tuff or tufa. Herculaneum was buried beneath a flood of mud swept down from Vesuvius during the Plinian eruption of 79, and the hard tufaceous crust which thus sealed up the infested city came in turn to be covered by lava-flows from subsequent eruptions: hence the difficulty of excavating at Herculaneum compared with similar work at Pompeii, where there was probably much less mud, since the city, having been at a greater distance from the volcanic centre, was overwhelmed in great measure by loose ashes, capable of removal with comparative ease.

It sometimes happens that volcanic mud is formed by the mingling of hot ashes not directly with rain but with water from streams and lakes, or even, as in Iceland, with melted snow. A torrent of mud was one of the earliest symptoms of the violent eruption of Mont Pelé in Martinique in 1902. This mud had its source in the Etang Sec, a crater-basin high up on the S.W. side of the mountain. By the explosive discharge of ashes and vapours mingled with the water of the tarn there was produced a vast volume of hot muddy matter which on the 5th of May suddenly escaped from the basin, when a huge torrent of boiling black mud, charged with blocks of rock and moving with enormous rapidity, rolled like an avalanche down the gorge of the Rivière Blanche. If a stream of lava obstructs the drainage of a volcano, it may give rise to floods.

**Ejected Blocks.—** When a volcano after a long period of repose starts into fresh activity, the materials which have accumulated in the crater, including probably large blocks from the disintegration of the crater-walls, have to be ejected. If the lava from the last eruption has consolidated as a plug in the throat of the volcano, the conduit may be practically closed, and hence the first effort of the renewed activity is to expel this obstruction. The hard mass becomes shattered by the explosions, and the angular fragments so formed are hurled forth by the outrushing stream of vapour. When the discharge is violent, the vapour, as it rushes impetuously up the volcanic duct, may tear fragments of rock from its walls and project them to a considerable distance from the vent. Such ejected blocks, by no means uncommon in the early stages of an eruption, are often of large size and naturally vary according to the character of the rocks through which the duct has been forced. They may be irregular masses of felsic rocks, possibly lavas of earlier eruptions, or they may be stratified, sedimentary and fissilose rocks representing the platform on which the volcano has been built, or the yet more deeply seated fundamental rocks. By Dr. H. J. Johnston-Lavis, who specially studied the ejected blocks of Vesuvius, the volcanic materials broken from the cone are termed "accessory" ejecta, whilst other fragmentary materials he conveniently calls "accidental" products, leaving the term "essential" ejecta for plastic lava, ashes, crystals, &c. Masses of Cretaceous or Apenine limestone ejected from Somma are scattered through the tuffs on the slopes of Vesuvius; and objects carved in such altered limestone are sold to tourists as "lava" ornaments. Under the influence of volcanic heat and vapours, the ejected blocks suffer more or less alteration, and may contain in their cavities many crystallized minerals. Certain blocks of sandstone ejected occasionally at Etna are composed of white granular quartz, permeated with vitreous matter and encased in a black scoriaceous crust of basic lava.

A rock consisting of an irregular aggregation of coarse ejected materials, including many large blocks, is known as a "volcanic agglomerate." Any fragmental matter discharged from a volcano may form rocks which are described as "pyroclastic.

**Cinders, Ashes and Dust.—** After the throat of a volcano has been cleared out and a free exit established, the copious discharge of vapour is generally accompanied by the ejection of fresh lava in a fragmentary condition. If the ejected masses bear obvious resemblance to the products of the hearth and the furnace, they are known as "cinders" or "scoriae," whilst the small cinders not larger than walnuts often pass under their Italian name of "lapilli" (q.v.). When of globular or ellipsoidal form, the ejected masses are known as "bombing" (g.v.) or "volcanic tears." Other names are given to the smaller fragments. If the lava has become granulated it is termed "volcanic sand"; when in a finer state of division it is called ash, or if yet more highly comminuted it is classed as dust; but the latter terms are sometimes used interchangeably. The pulverized material, consisting of lava which has been broken up by the explosion, or triturated in the crater, is often discharged in prodigious quantity, so that after an eruption the country for miles around the volcano may be covered with a blanket of fine ash. The fine ash is a combination of bone and snow, but often of greyish colour, looking rather like Portland cement, and in many cases becoming reddish by oxidation of the ferruginous constituents. Even when first ejected the ash is sometimes cocoa-coloured. This finely divided lava insinuates itself into every crack and cranny, reaching the interior of houses even when windows and doors are closed. A heavy fall of ash or cinders may cause great structural damage, crushing the roofs of buildings by sheer weight, as was markedly the case at Ottajano and San Giuseppe during the eruption of Vesuvius in 1906. On the sub-tropical slope of the sides of the volcanic cone like an avalanche, forming great ash slides with ridges and furrows rather like barrancos, or ravines, caused by rain. The burial of Ottajano and San Giuseppe in 1906 by Vesuvian ejecta, mostly lapilli, has been compared with that of Pompeii in 79.

Deposits of volcanic sand and ashes retain their heat long after ejected, so that rain will cause them to evolve steam, and if the wind be heavy and sudden it may produce explosions with emission of great clouds of vapour. The fall of ash is at first prejudicial to vegetation, and is often accompanied or followed by acid rain; but ultimately the ash may prove beneficial to the soil, chiefly if it is mixed with snow, but often of greyish colour, looking rather like Portland cement, and in many cases becoming reddish by oxidation of the ferruginous constituents. Even when first ejected the ash is sometimes cocoa-coloured. This finely divided lava insinuates itself into every crack and cranny, reaching the interior of houses even when windows and doors are closed. A heavy fall of ash or cinders may cause great structural damage, crushing the roofs of buildings by sheer weight, as was markedly the case at Ottajano and San Giuseppe during the eruption of Vesuvius in 1906. On the sub-tropical slope of the sides of the volcanic cone like an avalanche, forming great ash slides with ridges and furrows rather like barrancos, or ravines, caused by rain. The burial of Ottajano and San Giuseppe in 1906 by Vesuvian ejecta, mostly lapilli, has been compared with that of Pompeii in 79.
heavy, dark, crystalline minerals, whilst the dust at a distance was excessively fine and perfectly white. According to this observer, the parent mass had undergone a transformation and concretion of the finest particles into a yellowish, granulated, hard spar, glass. The finely comminuted material, carried to a great height in the atmosphere, consisted largely of delicate threads and attenuated spiral filaments, each of the form of a candle, and containing air-bubbles. The greater part of the dust was formed by the mutual attrition of fragments of brittle pumice as they rose and fell in the crater, which thus became a powerful "dust-making mill." By this tribulation of the numerous lava, carried on for the space of three months during which the eruption lasted, the quantity of finely pulverized material must have been enormous; yet the amount of ejected matter was probably very much less than that termed dust during some cases of historical eruptions, such as that at Tomboro in Sumbawa, in 1815. The explosions at Krakatoa were, however, exceptionally violent, having been sufficient to project as far as 15,000 feet into the atmosphere, and to have been at least 30 m. It is usually impossible during a great eruption to determine the height of the column of "smoke," since it hangs over the country as a pall of darkness.

The great black cloud, which was so characteristic a feature in the terrible eruptions in the West Indies, in 1902, was formed of steam with sulphur dioxide and other gases, very heavily charged with incandescent sand or dust, forming a dense mixture that in some respects behaved like a liquid. Unlike the Krakatoa dust, which was derived from a vitreous pumice, the solid matter of the black cloud was largely composed of fragments of crystalline minerals, which had been partially melted, and which were thrown up into the air by the explosions that during the afternoon of the 17th of May, 1902, the solid matter ejected from the Soufrière of St Vincent amounted to several billions of tons, and that some of the dust fell at distances more than 40 miles, and even to the sea.

In Mexico and Central America, under the favourable influence of warmth and moisture, rich soils are rapidly formed by the decomposition of the volcanic dust. In the central part of the volcanic areas in North America, especially in Nebraska and Kansas, are covered with thick deposits of volcanic dust, partly from recent eruptions but principally from volcanic activity in geologic time. The dust is used in the arts as an abrasive agent.

Lava.—The volcanic cinders, sand, ashes and dust described above are but varied forms of solidified lava. Lava is indeed the most characteristic product of volcanic activity. It consists of mineral matter which is, or has been, in a molten state; but the liquidity is not due to simple dry fusion. The magma, or subterranean molten matter, may be regarded as composed essentially of various silicates, or their constituents, in a state of mutual solution, and heavily charged with certain vapours or gases, principally water-vapour, superheated and under pressure. In consequence of the peculiar constitution of the magma, the order in which minerals separate and solidify from it is determined by the relative degree of fusibility, or the order of their relative fusibility. The lava differs from the magma before eruption, inasmuch as water and various volatile substances may be expelled on extrusion. The rapid escape of vapour from the lava contributes to the explosive phenomena of an eruption, whilst the rate at which the vapour is disengaged depends largely on the viscosity of the magma.

The lava on its immediate issue from the volcanic vent is probably at a white heat, but the temperature is difficult of determination since the molten matter is usually not easy of approach, by reason of the houing vapour. Determinations of temperature are generally made at a short distance from the exit, when the lava has undergone more or less cooling, on a small stream from a subordinate vent. A. Bartoli, using a platinum electric resistance pyrometer, found that a stream of lava near a beso, or source of emission, on Etna, in the eruption of 1892, had at a depth of one foot a temperature of 1090°C. On the return journey, where the lava stream was completely covered, but which were observed, and red and of copper have frequently been melted. Probably the lava at the surface of the stream has a temperature of something like 1100°C., but this must not be assumed to be its temperature at the volcanic focus. C. Doelter, in some experiments on the melting-point of lava by means of an electric furnace, found that a lava from Etna softened at from 962° to 979°C. and became fluid at 1010° to 1090°, whilst a Volcanian lava softened at from 962° to 1010°, and became fluid at 1080° to 1090°. These results were obtained at ordinary atmospheric pressure, but it has been assumed that the melting-point of lava at a great depth would, through pressure alone, exceed that obtained in the laboratory. On the centre of eruptions of Volcani in 1871, when the fiery torrent had a perpendicular fall of 50 ft.

In Hawaii the smooth shining lava, often superficially wavy and laccolithic, is known as pahoehoe, whilst the ragged cliffs, or aa. These terms are now used in a general terminology, having been introduced by American geologists. The fields of aa often contain lava-balls and bombs.
VOLCANO

pahoehoe corresponds practically with the *Fluiden lava* of German vulcanologists, and the aa with their *Schollen lava*. Rugged flows are known in Auvergne as *cheires*. The surface of a cinder-field has often a horribly jagged character, being formed of angular blocks bristling with sharp points. In the case of an obsidian-flow a most dangerous surface is produced by the keen edges and points of the fragmentary volcanic glass.

When the lava has become crusted over, the underlying magma should flow away, a long cavern or tunnel may be formed. Should the flow be rapid the roof may collapse and the fragments, falling in, may be consolidated inward and become absorbed in the fused mass. The walls and roof of a lava-cave are occasionally adorned with stalactites, whilst the floor may be covered with stalagmitic deposits of lava. The volcanic stalactites are slender, tubular, hollow, often fragmentary, and the crystalline, whilst the stalagmites are rounded, and the fragments are downed by convection-currents. On the other hand a solid piece, though denser than the corresponding liquid, may be buoyed up for a time by the viscous condition of the molten lava. Moreover, the presence of minutes of rest may lighten the mass. Although the minerals of a rock-magma may separately crystallize it does not follow that the magma itself, in which they probably exist in a state of solution, will not after crystallization a similar change of volume. On the whole, however, there seems reason to believe that lava on solidifying always almost diminishes in volume and consequently increases in density.

According to the experiments of C. Doelter the specific gravity of molten lava is invariably less than that of the same lava when solid, though in some cases the difference is but slight. In a vitreous or isotropic condition the lava has a lower density than when crystalline.

The figures are illustrated by the following table, where the figures give the specific gravity:

Experiments by Dr C. Barus showed that a diabase of specific gravity 3.017 formed a glass of sp. gr. 2.717, and melted to a liquid of specific gravity 2.818. In the various cases cited, he found that in all cases the rock in a vitreous state had a lower sp. gr. than in a crystalline condition, the difference being greatest in the acid plutonic rocks. A. Harker, however, has called attention to the remarkable change of specific gravity of the dyke rock, which is denser than the same rock in a crystalline condition in the interior of the dykes.

**Physical Structure of Lavas.**—An amorphous vitreous mass may result from the rapid cooling of a lava on its extrusion from the volcanic vent. The common type of volcanic glass is known as obsidian (q.v.). Microscopic examination usually shows that even in this glass some of the molecules of the magma have assumed definite orientation, forming the incipient crystalline bodies known as microlites, &c. By the increase of these minute enclosures, in number and magnitude, the lava may become devitrified and assume a lithoidal or stony structure. If the molten magma consolidate slowly, the various silicates in solution tend to separate by crystallization as their respective points of saturation are reached. Should the process be arrested before the entire mass has crystallized, the crystals that have been developed will be embedded in the residual magma, which may, on consolidation, form a vitreous base. It is believed that in many cases the lava brings up, through its conduit, certain crystals that have developed during solidification in the heart of the volcanic apparatus. Showers of crystals of leucite have occurred at Vesuvius, of labradorite at Etna, and of pyroxene at Vesuvius, Etna and Stromboli. They have been noticed as being magmatic, and had they remained in suspension, this magma might on consolidation have enveloped them as a ground-mass or base. A rock thus consisting of crystals surrounded by a ground-mass is termed a porphyry. In such a lava the large crystals, or phenocrysts, evidently represent an early phase of consolidation, and the minerals of the matrix a later stage. It is notable that the intercalated crystals often lack sharpness of outline, as though they had suffered corrosion by attack of the molten magma, whilst they may contain vitreous enclosures, suggesting that the surrounding mass was liquid during their consolidation. It is believed that the molten magma contained dissolved gases to a considerable depth, cooling slowly under great pressure, and forming rocks which are termed "plutonic" or "abyssal" to distinguish them from rocks truly volcanic, or those which, if not effusive, like lava-flows, have at least solidified very near the surface as dykes and sills. The volcanic and plutonic rocks pass, however, into each other by gradual transition. The dyke-rocks, or intrusive masses, form an intermediate group which may be distinguished under the name of "hypabyssal" rocks, as suggested by W. C. Brögger. Lavas extruded in submarine eruptions may have solidified under a great weight of sea-water, and therefore to that extent rather under plutonic conditions. The range of specific gravity of lavas is generally more than 50, between 30 and 60, or less than 50. Some lavas consist of various silicates, either crystallized as definite minerals or unidividualized as volcanic glass. In addition, however, to the mineral silicates, a volcanic rock may contain a limited amount of free acid and basic oxides represented by such minerals as quartz and magnesite. Rhyolite may be cited as a typical example of an acid lava, andesite as an intermediate and basalt as a basic lava. The various volcanic rocks are described under their respective headings, so that it is needless to refer here to their chemical or mineralogical composition. It may, however, be useful to cite a few selected analyses of some recent lavas and ashes:

In the course of the life of a volcano, the lava which it emits may undergo changes, within moderate limits, being at one time more acid, and at another more basic. Such changes are not always uniform, but may be modified by a shifting of the axis of eruption. Thus at Etna the lavas from the old axis of Trifoglietto in the Valle del Bove were andesites, with about 60 per cent of silica, but some of them were more doleritic, with a silica-content of only about 50%. It seems probable that, to a limited extent, changes in the character of a lava may sometimes be due to contact with the magma with different rocks underground; if these are in silica rich rocks, the lava will naturally increase; while if they are rich in calcareous and ferromagnesian constituents, the basalt will increase: the variation is consequently apt to be between andesite and basalt. In the above table, for instance, the basaltic andesite is intermediate between these extremes.

By various means and some others it has been held that during a long period of igneous activity a definite order in the succession of the erupted rocks is everywhere constant; but though some working coincidences may be cited, it is hard to find a generalization that has been satisfactorily established. It has, however, been often observed, as emphasized by Professor Iddings, that a volcanic centre will start with the emission of lavas of neutral or intermediate type, followed in the course of a geological period by
acid and basic lavas, and ending with those of extreme composition, indicating progressive change in the magma.

The old idea of a universal magma, or continuous pyroxisphere, has been abandoned, and there is reason to believe that in every case in the primitive condition of the interior of the earth, it seems necessary to admit that the magma must now exist in separate reservoirs. The independent identity of the large volumes of water and steam, which have escaped from them, has been the subject of much speculation among geologists of southern Italy and the neighboring islands exhibit little or no sympathy in their action, and emit lavas of diverse type. The lavas of Vesuvius, one of the Lipari Isles, are rhyolitic, whilst those of Stromboli, Lipari, and the Lipari islands, as well as Stromboli, are basaltic. The distinction, sometimes made after Prof. Iddings, as "consanguinity," and appears to be due to the fact that the rocks are drawn from a common source. Professor Judd pointed out the existence of a prior and lower generation, and that what are described as eruptive rocks during a given geological period have a certain family likeness and have appeared in definite succession. Thus he recognized a Brito-Icelandic petrographical province of Tertiary and recent lavas in the Pacific archipelagoes, and the analogous province of the Atlantic, which are generally associated with the Atlantic type of coast and sub-alkaline lavas of the Pacific type.

Although the character of an erupted product from a volcano is usually brought about very slowly, it has often been supposed that even in the course of a single prolonged eruption, or series of eruptions, the character of the lava may vary to some extent, and this is probably true of, and is engaged, in the case of basaltic lavas, as is usually the case with andesite. M. H. Arlandus, for instance, analysed the bombs of augite-andesite thrown out from Santorin at the beginning of the eruption of 1866, others ejected in 1867, and others again at the close of the same eruption. The chemical composition of the magma during these successive stages. Moreover, Professor A. Lacroix found that the material extruded from Vesuvius in 1906 remained practically the same composition from the beginning to the end of the eruption, and further, that it presented great analogy to that of 1872 and even to that of 1631.

All the Vesuvian lavas are of the type of rock known as leucophosphate or leucite-phyllite, or they pass by, in the presence of a little olivine, into leucite-basalts. Leucite is characteristic of the lavas of Vesuvius, and its olivine riet is excessively rare in those of Etna, where a normal doleritic type prevails. Nepheline, a felspathoid related to leucite, is common in the lavas of the islands. Many of the lavas from the volcanoes of South America consist of hornblende, a basic felspathoid, and the lavas of Guatemala are the result of the eruptions of St Vincent and Martinique in 1902 and from Krakatoa in 1883 were evidently derived from a magma of this Pacific type.

It commonly happens that acid lavas are paler in colour, less dense and less fusible than basic lavas, and they are probably drawn in some cases from shallower depths. As a consequence of the reasonable fusibility of many basic lavas, they flow freely on emission, running to great distances and forming far-spread sheets, whilst the more acid lavas, rapidly become viscous and tend to consolidate nearer to their origin, often in hummocky masses. The shape of a volcanic mountain is consequently determined by the activity of the material subterranean. When the lavas are of the product of the magma, it flows freely on a slope of less than one degree. In consequence, too, of this mobility, it is readily thrown into spray and even projected by the expansive force of the vapour into jets, which may rise to the height of hundreds of feet, and form columns of smoke, producing the appearance of "fire fountains." The emission is not usually accompanied, however, by violent explosions, such as are often found in the case of the composition of the lavas, and these are typically insular. L. Palmieri, however, described certain sublimes on lava at Vesuvius after the eruption of 1872 as deposits of "sea-salt," to show that they were not simply sodium chloride, but contaminated with other elements. L. Palmieri found that these were sea-salt, and he is a believer that the sea-salt is absorbed by certain basaltic lavas in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt in the course of their evolution, and becomes sea-salt.
When a stream of lava flows into the sea it no doubt immediately generates a prodigious volume of steam; but this is only a temporary phenomenon, for the lava rapidly becomes chilled by the cold water, with formation of a superficial solid layer, which by its low thermal conductivity prevents the internal heat from the stream being dissipated. In the great eruption of Krakatoa in 1883 the sea-water gained occasional access to the molten lava, and by its cooling effect checked the escape of vapour, thus temporarily diminishing the volcanic activity on the beach. It was found that the small balls of Siberian obsidian called marakeni threw off, when strongly heated, clouds of finely divided particles formed of pyroxene, olivine, quartz, and felspar, rather than mass through the escape of water. Fuses thus when ignited lose some cases as much as 10% of its weight, due to expulsion of water.

Much of the steam and other vapour brought up from below by a lava may be condensed on contact with the air, and a stream freshly extruded is generally beclouded with more or less vapour. Gaseous bubbles in the lava render it vesicular, especially in the upper part of a stream, where the pressure is relieved, and the formation of gases by subterranean subsidence or elongation in the direction of movement. Vesication, being naturally resisted by cohesion, is not common in very viscous lavas of the extrusive type, though such lavas become vesicular under great pressure, but it is seen to perfection in surface-flows of liquid lavas of basaltic character. A vesicular structure may sometimes be seen even in dykes, but the cavities are usually rounded rather than elongated, and are often arranged in bands parallel to the walls of the dyke. A very small proportion of water in a lava suffices to produce vesication. Secondary minerals developed in a cellular lava may be deposited in the steam-holes, thus producing an annular algal rock.

After the surface of a lava-stream has become rounded over, vapour may still be evolved in the interior of the mass, and in seeking release it forms fumaroles or gas vents. Such vents may, for instance, be thrown up on a lava-flow, and when vapour escapes from terminal or lateral orifices they are known as "spiracles." The stream may issue with sufficient projectile force to toss up the lava in little fountains, or it may overflow the very liquid lavas of the effusive type. In the Hawaiian lavas, it may after projection from the blow-hole fall back in drops and plastic clots, which on consolidation form, by their union, small cones.

During an eruption, the gaseous products may vary considerably. Johnston-Lavis found at Vesuvius that the vapour which first escaped from the boiling lava contained much sulphur and that hydrochloric acid and other chlorides appeared later.

If the vapours exhaled from volcanoes are derived originally from superficial sources, the lava would, of course, merely return to the earth what had been taken from it in the course of the cycle of change. But if, as is now rather generally believed, much if not most of the volcanic vapour is derived from original subterranean sources, and transported to the earth's surface by processes of the atmosphere and hydrosphere, and consequently becomes of extreme geological interest.

**Description of Special Gases and Vapours**—Hydrochloric acid, HCl, escapes abundantly from many vents, often accompanied with the vapours of certain metallic chlorides, and is responsible for much of the acid effects of volcanic exhalations. To avoid dangerous results, an active volcano should be ascended on the windward side. Free hydrochloric acid, HF, has sometimes been detected with the hydrochloric acid among Vesuvian vapours, and silicon fluoride, SiF₄, has also been reported. Sulphured hydrogen, H₂S, is a triangular gas, composed of two atoms of hydrogen and one of sulphur. This and the other combustible fumes have an unpleasant odour, and the lamp flames seen in some eruptions. It readily suffers oxidation, giving rise to sulphur dioxide and water. By the interaction of hydrogen sulphide and carbon dioxide, water and carbon oxyde are formed. CO₂, and often a portion of free carbon dioxide and free sulphur are produced, such being no doubt the origin of many deposits of volcanic sulphur. Hydrogen sulphide may be formed by the decomposition of certain metallic sulphides, like that of calcium, in the presence of moisture, as suggested by Anderson and Fleet with regard to certain muds at the Soufrière of St. Vincent. Sulphur dioxide, SO₂, is one of the commonest exhalations, especially in older eruptions, and is formed by the oxidation of various metallic sulphydrides, that of burning brimstone, even when present in very small proportion and in the presence of an excess of hydrochloric acid. By hydration it readily forms sulphurous acid, which may be further hydrated to sulphuric acid (with hydrochloric acid) in the water of the Rio Vinagre which issues from the volcano of Puracé in the Andes of Colombia; and it occurs, also in certain other volcanic waters. Carbon dioxide, CO₂, is generally a product of the later stages of an eruption, and is
VOLCANO

often evolved after all other gases have ceased to escape. Although it may sometimes be due to the decomposition of limestone, it seems to be mostly of true magmatic origin. At the well-known Grotta del Bue Marino in Italy, a first formation of a chloride resembling halite, KCl, was observed by the first visitors, and there has been for ages a copious discharge, and analyses of the air of the cave by T. Graham Young showed the presence of from 61.5 to 71.1% of chloride. Hence the first observer of this deposit, in the vapours (excluding water-vapour) emitted from the Solfatara near Pozzuoli in the Bay of Naples. The gas by its descent tends to accumulate in depressed areas, as in the Death Valley region of California, where the abundance of the yellow rhombohedral sublimate, which he proved to be a chloride of manganese and potassium, whence he proposed for it the name chloromanganokali. It was studied by L. J. Spencer, and found to be a mixture of CaCl2 and Na2MnCl4. But the yellow sublimate, CaCl2, has been found in cubic crystals on Vesuvius lava. Fluorite, or calcium fluoride, CaF2, is also known as a volcanic product. Lead chloride, PbCl2, a rare Vesuvian mineral, was named potinite, by Prof. Dr. Chappuz of Napoli. Therefore the yellow chloride may give rise to galena, PbS, found by A. Lacroix on Vesuvius in 1906. Atacacite, or cupric oxychloride, CuCl3/3Cu(OH)2, has been named by A. Lacroix in 1906. Another green mineral from Vesuvius was named by A. Sciacchi to be a sulphate containing copper, with potassium and sodium, which he named from its fine colour escholioria. The yellow in the sublimates on Vesuvius will sometimes plate the iron nails of a traveler's boots when crossing the newly erupted lava. Cupric oxide, CuO, occurs in delicate crystalline scales termed palmetire, by Prof. A. Lacroix. Sulphur, by A. Lacroix, was found in Vesuvius lava. The sulphur, which was formerly known as native sulphur, is called today the rimosus, which consists of the intergrowth of sulphur, FeS2, and FeS, and which is found in Vesuvius lava. As, which was named by A. Lacroix in 1874, and was named by O. Silvestri, who examined it, sideraetic.

Boric acid, H3BO3, occurs in the crater of Vesuvius so abundantly that it was at one time collected commercially. It has also led to the foundation of an industry in Tuscany, where it is obtained from the sifoni (v.g.) of the Maremma. From Sasso in Tuscany it has received the name of saponyl or sassoilit. Realgar, or arsenic sulphide, As4S4, occurs in certain volcanic exhalations and is deposited as an orange-red incrustation, often with a greenish tinge, as at the Solfatara, where it was named by A. Lacroix, As4S4, has also been found.

All of volcanic products, sulphur (g.) is in some respects the most interesting one. It may occur in quantities covering the area of a dormant volcano and be ignited by a fresh outburst of lava, thus producing flames which, from their position in the crater, may readily deal a death-blow to a vessel.
VOLCANO

has pointed out, similar phenomena have no doubt occurred elsewhere, especially in the Azores. By Drs Tempest Anderson and J. B. Flett, who were commissioned by the Royal Society to report on the phenomena, this type of explosive eruption is distinguished as the "Peléan type." Its distinctive character is found in the sudden emission of a dense black cloud of superheated and suffocating gases, heavily charged with incandescent dust, moving with great velocity and accompanied by the discharge of immense volumes of volcanic sand, which are not rained down in the normal manner, but descend like a hot avalanche. The cloud, with the avalanche, is called by Lacroix a nade Peléenne, or nade ardente, the latter term having been applied to a similar eruption on the island of San Jorge. This occurred in 1818. In its typical form, the cloud at Pelé appeared as a solid bank, opaque and impermeable, but having the edge in places hanging like folds of a curtain, and apparently of brown or purplish colour. Rolling along like an ink torrent, it produced in its passage intense darkness, relieved by vivid lightning. So much solid matter was suspended in the cloud, that it became too dense to mount ordinary obstacles and behaved rather like a liquid. It has, however, been suggested that its peculiar movement as it swept down the mountain was due not simply to its heavy charge of solids, but partly to the oblique direction of the wind and partly to the leaping of rough lava from the levees. The cloud, when it underwent enormous expansion, and Anderson and Flett were led to suggest that possibly at the moment of emission it might have been partly in the form of liquid drops, which on solidifying evolved large volumes of gas held previously in occlusion. The deadly effect of the blast seems to have been mostly due to the irritation of the mucous membrane of the respiratory passages by the fine hot dust, but suffocating gases, like sulphur dioxide and sulphuric hydrogen, were associated with the water-vapour. Possibly the incandescent dust was even hotter than this suffocating vapour, since the latter might be cooled by expansion.

It is said that the black cloud as it swept along was accompanied by an indraught of air, not however sufficiently powerful to check its rapid advance. The current of air was likened by Anderson and Flett to the irush of air at a railway station as an express train passes. An attempt was made to determine the temperature of the fatal blast which destroyed St Pierre, but without very definite results. Thus it was assumed that as the telephone wires were not melted the temperature was below the fusing-point of copper: possibly, however, the blast may have been hot enough to produce the effects which might normally be due to its temperature.

Shape of Volcanic Cones.—Those volcanic products which are solid when ejected, or, if solid, the sides of which are composed of lava, are generally a steep cone, their accumulation around the eruptive vent a hill, which, though generally more or less conical, is subject to much variation in shape. It occasionally happens that the hill is composed wholly of ejected blocks, not themselves of volcanic origin. In this case an explosion has rent the ground, and the effusive vapours have hurled forth fragments of the shattered rock through which the vent was opened. But no ash or other volcanic fragmentary material has been ejected, nor has any lava been poured forth. This exceptional type is represented in the Eifel by certain monticules which consist mainly of fragments of Devonian slate, more or less altered. In some cases the area within a ring of such rock is occupied by a hollow, or a rounded depression, known in the Eifel as a maar. Piles of fragmentary matter of this character, though containing neither cinders nor lava, may be fairly regarded as volcanic, inasmuch as they are due to the explosive action of hot subterranean vapours.

In the ordinary paroxysmal type of eruption, however, cinders and ashes are shot upwards by the explosion and then descend in showers, forming around the orifice a mound, in shape rather like the diminutive cone, but often larger. In very large eruptions the sides of cinder cones of this character may be formed within the crater of a large volcano during a single eruption: whilst large cones are built up by many successive discharges, each sheet of fragmentary material moving more or less regularly round the preceding layer. The symmetry of the hill is not infrequently affected by disturbing influences—a strong wind, for example, blowing the loose matter downwind. In some cases the cone has gradually prostrated itself into the shape of a cinder cone, then by further flow of lava, or by the growth of a scoriaceous cinder-cone, or by the formation of a scoria-cone, have developed into the form of a lava-dome. Many examples of this type are found around Vesuvius. The process is usually slow, varying from 30° to 45°, depending on the angle of repose of the ejectamenta. Excellent examples of small scoria-cones are found among the pyas of Auvergne in central France, whilst a magnificent illustration of this type of hill is furnished by Fujiyama, in Japan, which reaches an altitude of 12,000 ft. How such a cone may be rapidly built up was well shown by the formation of Monte Nuovo, near Pozzuoli—a hill 400 ft. high and a mile in circumference, which has been formed in the course of a few days in September 1538. The shape of a cinder cone may be retained for ages, since it is not liable to suffer greatly by denudation, as the rain soaks into the loose material and the latter is in consequence very firm. If the cone is built upon a porous substratum the water is carried away and the cone is liable to collapse. By a similar process it may be destroyed.

It often happens that the cinders and ashes ejected from a volcano become mixed with water, and so form a paste, which sets readily as a hard tufaceous mass. Such natural tuff is indeed similar to artifically built up tufa, such as that of a Roman temple. A remarkable example of such a formation is found in Auvergne, and is known as a tuff-cone. The world is remarkable for the occasional volcanic coverings of the sea. When lava and the volcanic mud are blown into the sea, they are quickly covered with the sea-bottom mud, and thus form a bed of volcanic material, and if this is subsequently carried away, it may be deposited as a volcanic deposit.

Lava-cones are built up of streams of lava which have consolidated and are usually accompanied by cinder-cones. As the lava usually flows from the volcano in different directions, it may be seen to flow from the centre, or flow from lateral or eccentric orifices, as irregular tongues, and do not generally form continuous sheets covering the mountain. The cone is the sole or chief element in the cone, the shape of the hill is determined to a great extent by the chemical composition and viscosity of the lava, its copiousness and the rapidity of flow. If the lava is highly plastic and mobile, it may spread to a great distance before solidifying, and thus form large cones and basaltic caves and rising perhaps to a great height, but remarkably flat in profile. Were the lava perfectly liquid, it would indeed form a sheet without any perceptible slope of surface. As a matter of fact, however, the lava are so fluent as to run down an incline of 1°, and it is probable that in some cases a slope of only 10° or even less. The colossal mass of Mauna Loa, in Hawaii, forms a remarkably flat broad cone, standing about 5000 ft. above sea-level, and spreading over a surface of 13,900 sq. ft. Major Dutton, writing in 1883, said that "a moderate eruption of Mauna Loa represents more material than Vesuvius has desquamated since the earliest period of its history. Yet the lava is so mobile that it generally wells forth quietly, without explosive demonstration, and therefore unaccompanied by fragmentary ejectaments. Fluent lavas like those of Hawaii are also poured forth from the volcanoes and volcanic fissures of Iceland.

If the lava be less basic and less fusible, the hill formed by its accumulation instead of being a low dome will take the shape of a cone with sides of higher gradient: in the case of andesitic cones, for example, the sides of the cone are often straight, or nearly so. If the lava contains much silica, as rhyolites and trachytes, may be emitted as very viscous lavas tending to form dome-shaped or bulbous masses. Such lavas solidify slowly, yet may be blown up into a cone, and in a semi-solid condition, it is possible to form large towers in size not by the lava running over the crater and down the sides, but by injection of the pasty magma within the expanding bulb of the cone. This is a mode of growth in which the dome consists of successive sheets that have been compared to the skins of an onion, has been illustrated by the experiments of Dr A. Reyner, and the structure is typically represented by the mamelons or steep-sided domes of the Isle of Bourbon. The Puy-de-Ingou in Auvergne is an example of a cone formed of the trachytic rock called from its locality domite, whilst the Dome sacroin in the same region illustrates the broad dome or saucer-shaped type of hill. Such domes may have or may not be crater, and it is then usually assumed that the top with the crater has been removed by denudation, but possibly in some cases such a feature has been formed by means of the water. If the lava be extremely fluid, acid lava extruded as a homogeneous mass, without conspicuous chymney or crater. Although domes are usually composed of acid rocks, it seems possible that they may be formed also of basic lavas, as the solidifying may be retarded slowly at a low temperature so as to be rapidly congealed.

The Spine of Pelé.—A peculiar volcanic structure appeared at Mont Pelé in the course of the eruption of 1902, and was the subject of much discussion by scientists in Europe and other parts of the world. One of the early observers, Mr. J. Wilson, of the Royal Geographical Society, says that the sandstone was excavated by means of a huge tuff cone, formed of scoria, the top of which had been removed, and other observers. It appears that from fissures in the floor of the Etang Sec a viscous andesitic lava, partly crystallized, was poured forth and rapidly solidified superficially, forming a dome-mound, which, by further activity, became sliced, and the interior was invaded by a more fluid lava. According to Lacroix, the crust soon became fractured, partly by shrinkage on consolidation and partly by internal tension, and the dome grew rapidly by injection of molten matter. Then there gradually rose from the dome a huge monolith or neckle, forming a terminal spine, which, in the course of its existence varied in shape and height, having been at its maximum in July 1903, when its absolute height was about
2376 ft. above sea-level. The walls of the spine, inclined at from 75° to 90° to the horizon, were apparently slickensided, or polished and scratched by friction; masses were occasionally detached and voluntarily fell inwards into the crater, and the whole of the cone has also formed. Some observers regarded the great spine as a solidified plug of lava from a previous outburst, expelled on a renewal of activity. Lacroix, however, believed it to be formed by the collapse of highly viscid magma, partly solidified before emission, and he compared the formation of the dome in the crater to the structure in Santorin in 1866, described by Kossuth. In any case, it has been regarded as a more or less perfect cone, of a kind of volcanic agglomerate, rising from a cone of talus formed of its ruins.

The exitive orifice in normal volcanoes—the beca of Italian vulcanologists—is usually situated at the bottom of a depression or cup, known as the crater. This hollow is formed and kept open by the explosive force of the elastic vapours, and when the volcano becomes dormant or extinct it may be closed, partly by rocks falling from its crumbling walls and partly by the solidification of the lava which it may contain. If a renewed outburst occurs, the floor of the old crater may reappear or a new outlet may be formed after a total breach of the cone. Hence a crater, with regard to position, be either terminal or lateral. The position of the crater will evidently be also changed on any shifting of the mountain, and in the cases of any very rapid movement of the earth's crust, the floor of a crater may be elevated to several hundred feet during the great eruption of 1906, the east side of the cone having lost, according to V. R. Matteucci, 120 metres.

While in many cases the crater is a comparatively small circular hollow around the orifice of discharge, it forms in others a large hollow, like cavity, such as is termed in some localities a "caldera." In the Sandwich Islands the craters are wide pits bounded by nearly vertical walls surrounded by a continuous concentric wall, or a great plain of black basalt, sometimes with lakes of molten lava. Professor W. H. Pickering compares the lava-pits of Hawaii to the crater-rings in the moon. Some of the pit-craters in the Sandwich Islands are known as Mauna Loa to the Hawaiians, after the great cone of the lunar craters. Dr. G. K. Gilbert, however, has suggested that the ring-shaped pits on the moon are not of volcanic origin, but are deformations formed by the impact of meteorites. Similarly has the "crater" of Coon Butte, near Canyon Diablo, in Arizona, which is 4000 ft. in diameter and 500 ft. deep, has been regarded as a vast pit due to collision of a meteorite of prodigious size. Probably the largest terrestrial volcanic crater is that of Aso-san, in the island of Kiushiu (Japan), which is a huge oval depression estimated by some observers to have an area of about 200 sq. m. Some of the large pit-craters have probably been formed by subidence, the core of the mountain being pushed back to the level of the surface. Asa-san, after the destruction of the cone, and the roof of the cavity having then subsided by loss of support. The term caldera has sometimes been limited to craters formed by subsidence.

On the floor of the crater, ejected matter may accumulate as a conical pile; and if such action be repeated in the crater of the new cone, a succession of concentric cones will ultimately be formed. The walls of a perfect crater form a ring, giving the cone a truncated appearance, but the ring may suffer more or less destruction in the course of the history of the mountain. A familiar instance of such change is afforded by Vesuvius. The mountain now so called, using the term in a restricted sense, is a huge composite cone, its base being within an old crateral hollow, the walls of which still rise as an encircling rampart on the N. and N.E. sides, and are known as Monte Somma; but the S. and W. sides of the ancient crater have disappeared, having been blown away during some former outburst, probably the Plinian eruption of 79. In like manner the relics of an old crater form an amphitheatre partially engulfing the Soufrière in St. Vincent, and other examples of "Somma sings" are known to vulcanologists.

Much of the fragmental material ejected from a volcano rolls down the inside of the crater, forming beds of tuff which incline towards the crater's margin. Beds of this kind, which are formed of sheets of cinder and lava which form the bulk of the cone slope away from the axis, or have a dip that is sometimes described as periclines, or folds, on their margins. These periclines, or "folds of theory," held especially by A. von Humboldt, L. von Buch and Elf de Beaumont, this inclination of the beds was regarded as mainly due to upheaval. It was contended that the volcanic cone owed its shape to "folds" created by differential subsidence of the earth's crust, burst at the summit to form the "elevation crater." Palma, in the Canaries, has been taken as a fine example of such an elevation. This view was opposed mainly by Poulet-Scorpée, Sir Chas. Lyell and Constant Prévost, who argued that the volcano, so far from being bladder-like, was practically a solid cone of erupted matter; hence this view came to be known as the "crater of eruption theory." Its general soundness has been demonstrated whenever an igneous structure of the cone of Krakatoa in 1883 a magnificent natural section of the great cone of Rakata, at the S. end of the island, was exposed—there is no doubt that having been lost. It is then evident that this mountain was a practically solid cone, built up from the successive accumulation of irregular beds of tuff and lava, braided together by intersecting dykes. The internal architecture of a volcano is rarely so simple; it is commonly composed of large and small fragments, the local expansion and rupture of the ground required by the old theory. It may be noted, however, that in recent years the view of elevation cones has been modified in order to explain certain facts.

Where the growth of a volcanic mound takes place within, as in certain steep-sides trachytic cones, there may be no perceptible crater or external outlet. Again, there are many volcanoes which have a crater at the summit, because the eruptions always take place from lateral outlets. Even when a terminal pit is present, the lava may issue from the body of the mountain, and in some cases it exudes from so many vents or cracks that the volcano has been described as "omega-shaped" or "mulberry-shaped.

Parasitic Cones.—In the case of a lofty volcano the column of lava may not have sufficient ascensional force to reach the crater at the summit, the greater part of it being blown away after a weak outburst. Thus at Etna, which rises to a height of more than 18,800 ft., the eruptions usually proceed from lateral fissures, sometimes at least a mile distant from the summit. Where such a weak outburst has ejected from a lateral vent a cinder-cone is formed, and by frequent repetition of such ejections the flanks of Etna have become dotted over with hundreds of scoria-cones much like the pays of Avuegno, of Monte Pelée in Martinique. It may be a feature of this kind.

The small cones which are frequently thrown up on lava streams were admirably exemplified on Vesuvius in the eruption of 1855 and figured by J. Schmidt. The name of "dribble cones" was given by Mr. Drury to those formed at the latter of the Krakatoa eruption. These were formed by avalanches of lava blown from escaping holes at Kilauea, the flows of lava remaining plastic and cohering as they fell. Such deposits form columns and plugs with almost a perfect cone, and the large or less of this character occur elsewhere, but are usually built up through spires. Small cones formed by mere dabs of lava are known trivially as "spatter cones."
a declining phase of volcanism. Sir Archibald Geikie, who has specially studied the subject of fissure eruptions, regards the Tertiary basaltic plateaus of N.E. Ireland and the Inner Hebrides as outflows from fissures, which may be represented by the gigantic submarine formations off the coast of Scotland. The structure of the northern part of Britain and Ireland. Those dykes extend over an area of something like 40,000 sq. m., while the outflows form an aggregate of about 5000 ft. in thickness. In parts of Scotland, on the other hand, the fissures are found to extend for miles, but the basalt from fissure eruptions occupy an area of about 200,000 sq. m., and constitute a pile at least 2000 ft. thick. In India the Deccan traps represent an outflow of volcanic matter, over an area of like extent but of Cretaceous date, while Switzerland furnishes other examples of similar outflows. Professor J. W. Gregory recognized in the Kaffe plains of East Africa evidence of a type of volcanic eruption extending over a similar extent of land.

Solidification.—Lava flows have cooled very slowly, both in water and air, or have been chilled by the earth, but the rock often consists of a close aggregate of regular polygonal prisms, mostly hexagonal. Each prism is divided at intervals by transverse joints, more or less curved, so that the portions are rather like the slices of cheese cut by a knife than by the holes through the columns of the columns at right angles to the cooling surface they are vertical in a horizontal sheet of lava, horizontal in a vertical dyke, and inclined or curved in other cases. It sometimes happens that in a basaltic dyke the formation of the prisms, having started from the opposite walls as chilling surfaces, has not been completed; and hence the prisms fail to meet in the middle. A spheroidal structure is often developed in basalt columns by weathering, the rock exfoliating in spherical shells, rather like the skins of an onion: such a structure is characteristically shown at the Kasekell, known also as the Ellen Grotto, at Berthier, near All on the Mosel, in Northern Ireland, in the Hebrides, in Ireland, and in the Hebrides, and is developed by the cooling of the molten lava. Some dyke, the rock exfoliates in the form of a prismatic sheet, and the rock is sometimes given the name of the slab.

Extrusive and Intrusive Magmas.—When the molten magma in the interior of the earth makes its way upward and flows forth superficially as a stream of lava, the product is described as extrusive, effusive, or effusive; but if, failing to reach the surface, the magma solidifies in a fissure or another subterranean cavity, it is said to be intrusive or intrusive. Many of the former group only are discovered at the surface as structures such as the dykes, the fissure variety of which is conventionally, at least in certain cases, to igneous rocks of the latter type, including therefore certain hypabyssal and even plutonic rocks. An intrusive magma has been forced into narrow irregular crevices it forms "veins," which may exhibit complex ramifications, especially marked in some acid rocks; but when injected into a rock mass, a lava flow, or lava sheet, composed of extrusive or intrusive rocks, that solidifies in situ is termed a "dyke." Most dykes are approximately vertical, or at least highly inclined in position. The inclination of a dyke to a vertical plane is termed its "hade.

When molten matter is thrust between beds of tuff or between successive lava-flows or even ordinary sedimentary strata, it forms an intrusive sheet of volcanic rock known as a "sill" or a "dyke," which may sometimes be traced to its connexion with a dyke, which reduced the channel up which the lava rose, but instead of reaching the surface the fluid found an easier path between the strata or perhaps through the tuff and flowed laterally. Although the "sill" may reach hundreds of feet in thickness, the process of formation, if the lava has been removed at the surface by denudation, the dyke termen terminates abruptly, so that its function as the former feeder of a lava sheet is indicated by the method of its formation.

Lava which has solidified itself between planes of stratification may, instead of spreading out as a sheet or sill, accumulate locally as a lenticular mass, known as a laccolith or laccolithic (q.v.). Such a mass, in many cases rather mushroom-shaped, may force the superincumbent rocks upwards as a dome, and though at first concealed may be ultimately exposed by removal of the overlying beds by erosion. The term laccolith was introduced by A. Harker to denote a meniscus-shaped mass of lava intruded in folded strata, along a previously existing fracture. The laccolithic of Professor Iddings is a laccolith of about 50,000 ft. in extent, a feature quite irregular in shape has been termed by R. A. Daly a chonolith (Gr. chonlith, a mound), whilst an intrusion of very great size and ill-defined form is sometimes described as a batholith or batholite.

Structural Peculiarities in Lava.—Many of the structures exhibited by lava are due to the conditions under which solidification has been effected. A dyke, for example, may be vitreous at the margin where it has been rapidly chilled by contact with the walls of the fissure into which it was thrown, or it may be crystalline or lithoidal or crystalline; hence a basalt dyke will sometimes have a selvage formed of the fassahic glass known as tachylite. A similar dyke frequently has a thin selvage of checkered or columnar structure or "perlitic cracks" of certain obsidians, indicating a tendency to assume a peculiar structure. The first-formed crystals of such a structure being removed by the accumulation of "spherulites," or globular masses with a radiating fibrous structure, sometimes well seen in devitrified glass. Occasionally the spherulitic bodies in lava are hollow, when they are known as lithophyses, of which excellent examples occur at Obsidian Cliff near the Yellowstone National Park, as described by Professor Iddings. Globular structure on a large scale is sometimes displayed by lavas, especially those of basic type, such as the basalt of Acé Castello in Portugal, the basalt of Platañia, by flow of the lava into subaqueous sill of the Mediterranean, and the basalt of Savages. Joints, or cracks formed by shrinkage on solidification, may occasionally occur at the surface of a lava, but are more commonly recognized in the form of cracks or fissures in the lava in which it is intruded. In the rock of the Mediterranean. Dr T. Anderson has observed them in the recent lavas of Savages.

Submarine Volcanoes. Considering how large a proportion of the face of the earth is covered by the sea, it seems likely that volcanic eruptions must frequently occur on the ocean-floor. When, as occasionally though not often happens, the effects of a submarine eruption are observed during the disturbance, it is seen that the surface of the sea is violently agitated, with copious discharge of steam; the water passes into a state of ebullition, perhaps rising up huge fountains; showers of dead ashes, with volcanic cinders, bombs and fragments of pumice, float around the centre of eruption, and ultimately a small island may appear above sea-level. This new land is the peak of a volcanic cone which is based on the sea-floor, and if in deep water the submarine mountain must evidently be of great magnitude. Christmas Island in the Indian Ocean, described by Dr C. W. Andrews, appears to be a volcanic mountain, with Tertiary limestones, standing in water more than 14,000 ft. deep. Many volcanic islands, such as those abundantly scattered over the Pacific, must have started as submarine volcanoes which reached the surface either by continued upward growth or by upheaval of the sea-bottom. Etna began its long geological history by submarine eruptions in a bay of the Mediterranean, and Vesuvius in like manner represents what was originally a volcano on the sea-floor. As the ejectaments from a submarine vent accumulate on the sea-bottom they become intermingled with relics of marine organisms, and thus form fossiliferous volcanic tuffs. By the distribution of the ashes over the sea-floor, through the agency of waves and currents, these tuffs may pass insensibly into submarine deposits of normal sedimentary type.

One of the best examples of a submarine eruption resulting in the formation of a great island is the volcanic island of the Canaries between Sicily and the coast of Africa, where the water was known to have previously had a depth of 100 fathoms. After the eruptions of volcanic activity in 1436 and 1437, the volcanic cinders and ashes formed an island which reached at one point a height of 200 ft., so that the pile of erupted matter had a thickness of about 800 ft. The new island, which was studied by Constant in 1707, is considered by many to be the same as Vulcão de Ilheu and in Italy by various names as Isola Ferdinandea. Being merely a loose pile of scoriae, it rapidly suffered erosion by the sea, and in about three months was reduced to a shoal called Graham's
Reef. In 1891 a submarine eruption occurred near the island of Pantelleria in the same waters, and the eruptive centre was termed by Professor H. S. Washington and Fosseranti volcano, but it gave rise to no outflow. A well-known volcano, though small, was emplaced at Cerro del Totumo in 1796, and this eruption lasted about one month, and was observed by Humboldt, who considered it to be the most remarkable of the year. The eruption of some of the volcanic cones in the neighborhood of this volcano was similar to that of the volcanoes of the Duncan, and more distinct, including the largest volcanic mountains in the world. The grandest group of South American volcanoes, though generally rather insignificant, is in Ecuador. Cotopaxi, seen in activity from the summit of Chimborazo, in 1850 by Humboldt, and reported by him to be the highest volcano in the world, is an active volcano which, in 1880, produced a considerable amount of ash and sand. The crater of Cotopaxi is 3,000 ft. in diameter, and is surrounded by a rise of black sand which has continued to rise to an elevation of about 500 ft. The mud oozes from the top and spreads over the sides, or is spurted forth with the gases. Occasionally the discharge is vigorous, mud and stones being thrown up to a considerable height, sometimes accompanied by flames due to combustion of the hydrocarbons. Mud volcanoes occur in groups, and have a wide distribution. They are known in Iceland; in Modena; at Taman and Ketch, in the Crimea; at Baku on the Caspian; in Java and in Trinidad; Humboldt described those near Turbaco, in Colombia. In Sicily they occur in the Gergenti, and a group is known at Patagona on Elba. By the Sicilians they are termed, masolude, a word of Arabic origin. The "paint-pots" of the Yellowstone National Park are mud volcanoes. Many so-called mud volcanoes appear to be due to the drainage of subterranean water-flow or to landslips in connection with earthquakes, whilst others may be referable to certain chemical reactions going on underground; but there are others again which seem to be truly volcanic origin. Hot water and steam escaping through clay, or crumbling tufts reduced to a clayey condition, may form conical mounds of pumice, which rise to an elevation of about 500 ft. Sometimes mud volcanoes give an appearance of being connected with the mountain and destroyed Old Guatemala, but this flood was probably not of volcanic origin.

The plateau of Mexico is the seat of several active volcanoes which occur in a band stretching across the country from Colima, in the west to Tuxtlas near Vera Cruz. The highest of these volcanic mountains is Oraiba, or Cithaltepetl, rising to an altitude of 17,880 ft. and known to have been active in the 19th century. The Popocatepetl ("the smoking mountain") reaches a height of about 17,880 ft., and from its crater sulphur was at one time systematically collected. The famous volcano of Jorullo, near Toluca, at a distance of about 150 m. from the sea, has been the centre of much scientific discussion since it was regarded by Humboldt, who visited it in 1803, as a striking proof of the elevation theory. It came into existence rapidly during an eruption which began in September 1814, and by January 1815 it was said to be about 500 ft. high. The ground became suddenly inflated from below. The cone, though not of exceptional magnitude, is situated in an elevated district, and its foundation is doubtless to a large extent subterranean. The cone of Jorullo is divided into several parts, and from these numerous vents form a mass of rough barren surfaces, which pass under the name of malpais, or bad lands. In the United States very few volcanoes are active at the present day, though many have been active in times that are comparatively recent. An eruption occurred in 1857 at Tres Virgenes, in the south of California, and the cinder cone on Lassen's Peak (California) was also active in the 19th century. The Mono Valley craters and Mount Shasta, in California, are extinct. The Cascade Range contains numerous volcanic peaks, but only a few do not show signs of activity. Mount Hood, in Oregon, exhalas vapour from a number of vents, but the most interesting are Mount Rainier (Washington) was in eruption in 1811 and 1822, and Mount Baker (Washington), the most northern of the volcanoes connected with the Cascade Range, is said to have been active in 1834. Few volcanic peaks occur in the Rocky Mountains, but evidence of lingering activity is very marked in the geysers and hot springs of the Yellowstone National Park. The earth's internal heat is also manifested at many points elsewhere, as at Steamboat Springs on the Virginia Range, an offshoot of the Sierra Nevada, and in the Comstock Lode. Volcanic activity is prominent in Alaska, along the Coast Range and in the neighbouring islands. The crater of Mount Edgecumbe, in Lazard Island, is said to have been active in 1796, but this is doubtful. Mount Fairweather has probably been in recent activity, and the lofty cone of Mount Wrangell, on Copper River, is reported to have been in eruption in 1819. In the neighbourhood of Cook's Inlet there are several volcanoes, including the island of St Augustine. Unimak Island has two volcanoes, which have supplied the natives with sulphur and obsidian; one of these volcanoes being Mount Shishaldin, a cone rivalling Fishtyama in graceful contour. The great volcanic ring may be traced, though with many and extensive interruptions, from Cape Horn to Alaska. In South America the chain of the Andes between Corcovado in the south and Tolima in the north is composed of volcanic rocks, and these volcanoes are more distinct, including the loftiest volcanic mountains in the world. The grandest group of South American volcanoes, though mostly quiescent, is in Ecuador. Cotopaxi, seen in activity from the summit of Chimborazo, in 1850 by Humboldt, and reported by him to be the highest volcano in the world, is an active volcano which, in 1880, produced a considerable amount of ash and sand. The crater of Cotopaxi is 3,000 ft. in diameter, and is surrounded by a rise of black sand which has continued to rise to an elevation of about 500 ft. The mud oozes from the top and spreads over the sides, or is spurted forth with the gases. Occasionally the discharge is vigorous, mud and stones being thrown up to a considerable height, sometimes accompanied by flames due to combustion of the hydrocarbons. Mud volcanoes occur in groups, and have a wide distribution. They are known in Iceland; in Modena; at Taman and Ketch, in the Crime; at Baku on the Caspian; in Java and in Trinidad; Humboldt described those near Turbaco, in Colombia. In Sicily they occur in the Gergenti, and a group is known at Patagona on Elba. By the Sicilians they are termed, masolude, a word of Arabic origin. The "paint-pots" of the Yellowstone National Park are mud volcanoes. Many so-called mud volcanoes appear to be due to the drainage of subterranean water-flow or to landslips in connection with earthquakes, whilst others may be referable to certain chemical reactions going on underground; but there are others again which seem to be truly volcanic origin. Hot water and steam escaping through clay, or crumbling tufts reduced to a clayey condition, may form conical mounds of pumice, which rise to an elevation of about 500 ft. Sometimes mud volcanoes give an appearance of being connected with the mountain and destroyed Old Guatemala, but this flood was probably not of volcanic origin.

**VOLCANO**
Aletian volcanic belt is a narrow, curved chain of islands, extending from Cook’s Inlet westwards for nearly 1,600 m. It is notable that the convexity of the curve faces the great ocean, as has been observed in other cases, the arcs following the direction of the rock-folds. Approximately, by the time of T. C. Russell, the geologist of N. America, there are in the Aletian Islands and in the peninsula no fewer than 57 craters, either active or recently extinct.

It is known that a long band of the Pacific changes its direction, and passing to the peninsula of Kamchatka, where 14 volcanoes are said to be active, turns southwards and forms the festoon of the Kurile Islands. Here again the convexity of the island faces the great ocean. This volcanic archipelago leads on to the great islands of Japan, where the volcanoes have been studied by Professor J. Milne, who also described those of the Kuriles. Of the 54 volcanoes recognized as now active or recently extinct, the best known are the group of the sacred mountain Fujiyama, but others less pretentious are far more dangerous. The great eruption of Bandaian, about 120 m. of Toku, which occurred in 1888, blew off the side of the peak called Kohandai, removing, according to Professor Sekiya’s estimate, about 2,982 million tons of material. Aso-san in Kiushii, the southernmost large island of Japan, is notable for the enormous size of its crater. In the Bonin group of islands volcanic activity is indicated by such names as Volcano Island and Sulphur Island.

South of the Japanese archipelago the train of volcanoes passes through some small islands in or near the Loo Choo (Li Kiu) group and the Kurile Islands, where a large number of active and subterranean activity finds abundant expression in earthquakes and volcanoes. After leaving this region the linear arrangement of the islands is more irregular, though towards the south, for instance, every island in the Moluccas and the Sunda Archipelago teams with volcanoes, solfataras and hot springs. Possibly, however, a broken zone may be traced from the Moluccas through New Guinea and the Celebes, and outwards, perhaps, into the islands of the Philippines (for though no active volcanoes are known there, relics of comparatively recent activity are abundant); or again by way of the Bismarck Archipelago, the Solomon Islands, the New Hebrides, the Fiji Islands and Kerama Islands.

The great volcanic district in New Zealand is situated in the northern part of North Island, memorable for the eruption of Tarawera in 1886, which covered a mountain range with a layer of ash Tarawera, not previously known to have been active, suddenly burst into action; a huge rift opened, and Lake Rotomahana subsided, with destruction of the famous sinter terraces. The crater of Tarawera has become a lake, Mount Rihoua, which was regarded as extinct. On White Island in the Bay of Plenty the cone of Whakariki is feebly active.

Far to the south, on Ross Island, off South Victoria Land, in Antarctica, are the volcanoes of Erebus and Terror, the former of which is active. These are often regarded as remotely related to the Pacific zone, but Dr G. T. Prior has shown that the Antarctic volcano category which he examined belonged to the Atlantic and not the Pacific type.

Within the great basin of the Pacific, imperfectly surrounded by its broken girdle of volcanoes, there is a vast number of scattered islands. Some of these islands of minor origin, of volcanic or submarine birth, and having in many cases active craters. The most important group is the Hawaiian Archipelago, where there is a chain of islands, including active volcanoes, extending from the extreme of the exception of three in Hawaii, namely Mauna Loa, Kilauea and Kualalii; and of these Kualalii has been dormant since 1811. It is notable that the two present gigantic centres of activity, though within 20 m. of each other, appear to be independent in their eruption. Several of the Hawaiian Islands, as pointed out by J. D. Dana, who was a very high authority on this group, consist of two volcanoes united at the base, forming volcanic twins or doublets.

The volcanic regions of the Pacific are connected with those of the Indian Ocean by a grand train of islands rich in volcanoes, stretching from the west of New Guinea through the Moluccas and the eastern extremity of the Philippine Islands, and of which the Java and Sumatra.

Here is situated the principal theatre of terrestrial volcanicity, apparently representing an enormous fissure, or system of fissures, in the earth’s crust, sweeping in a bold curve, with its convexity towards the Indian Ocean.

Numerous volcanic peaks occur in the string of small islands to the east of Java—notably in Flores, Sumbawa, Lombok and Bali; and the Java group of terrestrial eruptions and volcanic activity of the world occurred in the province of Java, in the island of Sumbawa, in the year 1815. Java contains within its small area as many as 49 great volcanic mountains—active, dormant and extinct. The largest of these is Mt. Gunung Memanggo, a volcanic cone which is said to be Gunung Lamongang, which is in almost uninterrupted activity, emitting usually only ashes and vapour, though in 1883 Java stream as through. Many of the Javanese volcanoes possess great and deep craters. The cones of the Java and Sumatra, like those of the Pyrenees, are vastly more symmetrical and rugged, some being conical, others irregular and slightly sunken; many being steeply furrowed by tropical rains and sometimes riddled by ash-slides. The radian furrows on volcanic cones are sometimes known as "barrancos."

The little uninhabited island of Krakatoa in the Strait of Sunda appears to be situated at a volcanic node, or the intersection of two curved fissures, and it is believed that the island itself represents part of the basal wreck of what was once a volcanic gigantic. After two centuries of repose, a violent catastrophe occurred in 1833, and since then this island has been the scene of two eruptions and its effects were made the subject of careful study by Vorbeek, Brion and Judd.

On the western side of Sumatra, on the island of Sumatra, is a chain of volcanoes which, running north and south, contains the Mascarenne group, several craters in Réunion (Bourbon) being still active. Far south in the Indian Ocean are the volcanic islands of New Amsterdam and St Paul. The Comoro Islands in the Atlantic Ocean contains the peaks of the African volcanoes, and in Central Africa there are several centres, mostly extinct but some partially active, associated with the Rift Valleys. The enormous cones of Kenia and Kilimanjaro are extinct, but on the Kusoi of the summits of the latter, a crater is still preserved. The Mombacho volcanoes, S. of Lake Edward, rise to a height of more than 14,700 feet. Kirunga, N. of Lake Kivu, is still partially active. Elgon is an old volcanic peak, but Ruwenzori is not of volcanic origin. On the west side of Africa, the Cameroon Peak is a volcano which was active in 1909, and the island of Fernando Po is also volcanic. Along the Red Sea there are not wanting several examples of volcanic activity, Suez and Akakus.

Passing to the Atlantic, a broken band of volcanoes, recent and extinct, may be traced longitudinally through certain islands, some of which are noted for the formation of small volcanoes in part of its length, into an eastern and a western trough. The northern extremity of the series is found in Jan Mayen, an island in the Arctic Ocean, where an eruption occurred in 1818. Iceland, too, is a volcanic land, and is the largest point of the end of all the Atlantic centres. According to Dr T. Thoroddsen there are in Iceland about 130 post-glacial volcanoes, and it is known that from 25 to 30 have been in eruption during the historical period. Many of the Icelandic lava-floors, such as the immense flood from Lak (Skapa Jökull) in 1783, are referable to fissure eruptions, which are the characteristic though not the only kind of lava formations. They are also responsible for the sheets of old lava in the terraced hills of the Faroe Islands, to which may have been related the Tertiary volcanoes of the west of Scotland and the north of Ireland.

An interesting development from the volcanic archipelagoes of the Azores, the Canaries and the Cape Verde Islands. Palma—a little island in the Canary group, with a caldera or large crater at its summit, from which fissions of volcanic radiate—is famous in the history of volcanology, in that it furnished L. von Buch with evidence on which he founded the "crater-of-elevation" theory. The remaining volcanic islands of the Atlantic are not of volcanic origin. The island of Tristan da Cunha, whilst in the western part of the South Atlantic are the small volcanic isles of Trinidad and Ferdinandino do Noronha. St Paul’s rocks appear also to be of volcanic origin.

One of the most remarkable facts in the geology of the world is found in the West Indies, where the Lesser Antilles—the scene of the great catastrophes of 1902—form a string of islands, stretching in a regular line from the island of Tobago to the island of Martinique, about 400 miles in length, and separated from the Greater Antilles by the Caribbean Sea. Subject to frequent seismic disturbance, and rich in volcanoes, solfataras and hot springs, these islands seem to form the summit of a great earth-fold which, rising as a curved ridge from deep water, separates the Caribbean Sea from the Atlantic. The volcanoes are situated on the inner border of the curve. It is notable that the Antilles and the Sunda Islands, two of the grandest theatres of volcanicity on the face of the earth, are situated at the antipodes of each other—one being apparently an eastern and the other a western offshoot of the great Pacific girdle.

The European volcanoes, recent and extinct, may be regarded as forming a great girdle around the main body of the Atlantic land. Vesuvius is the only active volcano on the mainland, but in the Mediterranean there are Etna on the coast of Sicily; the Lipari Islands, with Stromboli and Vulcano in chronic activity; and another, the Etna, on the island of Sicily, where new islands have appeared in historic times. Submarine eruptions have occurred also between Sicily and the coast of Africa; one in 1870, which is believed to have given rise to the island of a small volcanic cone, 100 feet through. In 1891, appearing near Pantelleria, itself a volcanic isle. Of the extinct European volcanoes, some of the best known are in Auvergne, in the Eifel, in Bohemia and in Catalonia, whilst the volcanic activity of Italy is one of the most notorious phenomena of the Phlegrean Fields, &c. The great lakes of Bolsena and Bracciano occupy old craters, and many smaller sheets of water are on similar sites. The volcanic islands no longer active include Iceland, with the immense crater of the Grænavatn, and a number of the Balearic Islands, the Porza Islands, Nisi, Vivera and others near Naples, and several in the Greek archipelago, such as Milos, Kimolos and Paros.

From the eastern end of the Mediterranean evidence of former
volcanic activity may be traced into Asia Minor and thence to Armenia and the Caucasus. East of Smyrna is there a great desolate tract which the ancients recognized as volcanic and termed Euxine Desert. The volcanic districts of Lydia were studied by Professor H. S. Washington. In the plateau of Armenia there are several extinct volcanic mountains, more or less destroyed, of which the best known is Ararat. Nimrud Dugh on the shore of Lake Van is said to have been in eruption in the year 1441. Dr F. Oswald has described the volcanoes of Armenia. Of the volcanoes in Persia territory now not active, Demavend, south of the Caspian, is the most important. But it has been doubted whether it still active, and recent volcanic rocks are known from the Przevalsky chain and other localities.

The number of volcanoes known to be actually active on the earth is generally estimated at between 300 and 400, but there is reason to believe that this estimate is far too low. If account be taken of those volcanic cones which have not been active in historic time, the total will probably rise to several thousands. The distribution of volcanoes at various periods of the earth's history, as revealed by the local occurrence of volcanic rocks at different horizons in the crust of the earth, is discussed in Part II. Periods of great earth-movement have been marked by exceptional volcanic activity.

Causes of Volcanicity.

In discussing the cause of volcanicity two problems demand attention: first the origin of the heat necessary for the manifestation of volcanic phenomena, and secondly the nature of the force by which the heated matter is raised to the surface and ejected. According to the old view, which assumed that the earth was a sphereol of molten matter invested by a comparatively thin crust of solid rock, the explanation of the phenomena appeared fairly simple. The molten interior supplied the heated matter, while the shrinkage of the cooling crust served to produce the volcanic eruptions. It is, however, probable that subterranean reservoirs of magma were the origin of all volcanic activity, the crust of the earth being capable of being squeezed out in the process of contraction. When physicists urged the necessity of assuming that the globe was practically solid, volcanologists were constrained to modify their views. Following a suggestion of W. Hopkins of Cambridge, they supposed that there were, instead of existing in a general central cavity, was located in comparatively small subterranean lakes. Some authorities again, like the Rev. O. Fisher, regarded the magma as constituting a liquid zone, intermediate between a solid core and a solid shell.

If solidification of the primitive molten globe proceeded from the centre outwards, so as to form a sphere practically solid, it is conceivable that portions of the original magma might nevertheless be retained in cavities, and thus form "residual lakes." Although the mass might be for the most part solid, the outer portion, or "crust," could conceivably have a honeycombed structure, and any magma retained in the cells might serve indirectly to feed the volcanoes. Neighbouring volcanoes seem in some cases to draw their supply of lava from independent sources, favouring the idea of local cisterns or "intercrustal reservoirs." It is, however, probable, that subterranean reservoirs of magma, if they exist, do not represent relics of an original fluid condition of the earth, but the molten material may be merely rock which has become fused locally by a temporary development of heat or more likely by a relief of pressure. It should be noted that the quantity of magma required to supply the most copious lava-flows is comparatively small, the greatest recorded outflow (that of Tomboro in Sumhava, in 1815) not having exceeded, it is said, six cubic miles; and even this estimate is probably too high. Whilst in many cases the magma-cisterns may be comparatively small and temporary, it must be remembered that there are regions where the volcanic rocks are so similar throughout as to suggest a common origin, thus needing intercrustal reservoirs of great extent and capacity. It has been suggested that comparatively small basins, feeding individual volcanoes, may draw their supply from more extensive reservoirs at greater depths.
centre outwards, caused local fusion of the rocks, though without forming distinct reservoirs of molten magma, and the fused matter charged with gases rose in liquid threads or tongues, which worked their way upwards, some reaching the superficial part of the earth and escaping through fissures in the zone of fracture, thus giving rise to volcanic phenomena. It is held that the explosive activity of a volcano is due to the pressure which has been built up from the interior of the earth, whilst only a small and perhaps insignificant part is played by water of superficial origin.

Entirely new views of the origin of the earth's internal heat have resulted from the discovery of radioactivity. It has been shown by the Hon. R. J. Strutt, Professor J. Joly and others, that radium is present in all igneous rocks, and it is estimated that the quantity in the crust of the earth is ample sufficient to maintain its temperature. An ingenious hypothesis was enunciated by Major C. E. Dutton, who found in the radioactivity of the rocks a sufficient source of heat for the explanation of all volcanic phenomena. He believes that the development of heat arising from radioactivity may gradually bring about the local melting of the rocks so as to form large subterranean pools of magma, from which the volcanoes may be supplied. The supply is usually drawn from shallow sources, probably, according to Dutton, from a depth of not more than three or rarely four miles, and in some cases at not more than a mile from the surface. If the water in the local magma should attain sufficient expansive power, it will rupture the overlying mantle and give rise to an eruption. Before the reservoir becomes exhausted the eruption ceases, but if more heat be generated by continued radioactivity further fusion may ensue, and in time the eruption be repeated. According, however, to Professor Joly, it is improbable that sufficient heat for the manifestation of volcanic phenomena could be developed by the local radioactivity of the rocks in the upper part of the earth's crust.

Himalayas, and North America, are divided into genera and subgenera. Examples of some of these are afforded by the English representatives of the group.

The first of these is the common short-tailed field-mouse, or "field-vole," *Microtus agrestis*, which belongs to the typical section of the upper Volga with the Neva, the commercial mouth of the Volga has been transferred, so to speak, from the Caspian to the Baltic, thus making St Petersburg, the capital and chief seaport of Russia, the chief port of the Volga basin as well. Other less important canals connect it with the Western Dvina (Riga) and the White Sea (Archangel); while a railway only 5 m. in length joins the Volga with the Don and the Sea of Azov, and three great trunk lines bring its lower parts into connexion with the Baltic and western Europe.

The Volga rises in extensive marshes on the Valdai plateau, where the W. Dvina also has its origin. Lake Seiger was formerly considered to be the principal source; but that distinction is now given to the rising issuing between the Volga and the Oka (L. *...*) in the midst of a large marsh to the west of Seiger. The honour has also been claimed, not without plausibility, for the Kuna rivulet. Recent exact surveys have shown these originating streams to be no more than 2 ft. above sea-level, and the Volga first traverses several small lakes, all having the same level, and, after its confluence with the Kuna, enters Lake Volga. A dam 5 m. from its mouth 5 miles below the source with a capacity of 5,000,000 million c.f. of water, makes it possible to raise the level of the Volga as far down as the Shelkina, thus rendering it navigable, even at low water, from its 65th mile onwards.

The Volga flows with a very gentle descent towards the south-east, past Yaroslavl and Kostroma, along a broad valley hollowed to a depth of 150-200 ft. in the Permian and Jurassic deposits. In fact, its course lies through a series of depressions from which the lakes are huddled together. When the Volga at length assumes a due south-east direction it is a large river (8250 cuf. ft. per second, rising occasionally in high flood to as much as 178,300 cuf. ft.) of its numerous tributaries, the Uzha (365, 339 navigable), from the north, is the most important.

The next great tributary is the Oka, which comes from the southwest after having traversed, on its course of 950 m., all the greatest Russian provinces of central Russia. It rises in the govern-

ment of Orel, among hills which send tributaries to the Dnieper and the Don, and receives on the left the Upa, the Dvina (600 m. above the mouth of the Ugra (300 m. above the mouth of the Dnieper), the Klyazma (305 m.), on whose banks arose the middle-Russian principality of Suzdal, and on the right the navigable tributaries of the Volga, the Kama and the Seiger (20 m. above the mouth of the Seiger and the Kama) and the tracts of the Caspian sea, all navigable, are connected with some important event in the history of Great Russia. The drainage area of the Oka is a territory of 97,000 sq. m. It has been maintained that, of the two rivers which unite at Nizhny-Novgorod, the Oka, not the Volga, is the chief; the fact is that both in length (818 m.) and drainage area above the confluence (86,500 sq. m.), as well as in the aggregate length of its tributaries, the Volga is the inferior stream.

At its confluence with the Oka the Volga enters the broad lacustrine depression which must have communicated with the Caspian during the post-Pliocene period by means of at least a broad strait. This deep lake is only 90 ft. above that of the Caspian. Immediately below the confluence the breadth of the river ranges from 350 to 1750 yds. There are many islands which change their appearance and position after each inundation. On rising 5 ft. the level of the Caspian, the Volga is joined by the Seiger, which drains a large area and brings a volume of 2700 to 22,000 cuf. ft. of water per second, the Vetluga (456 m. long, of which 365 are navigable), from the forest-fracts of Yaroslav, and many smaller tributaries. Then the Volga enters the Young Russian, or the Caspian depression, where it receives the Kama, below Kazan. Remains of mounds still exist in the Caspian on the Caspian to the Caspian.

The Kama, which brings to the Volga a contribution ranging from 32,000 to 144,400 cuf. ft. and occasionally reaching 315,000 cuf. ft. per second, might again be considered as the more important of the two rivers. It rises in the Northern Urals, takes a wide swing towards the Caspian sea, and then flows south and west-south to join the Volga after a course of no less than 1150 m.

The Volga is navigable from Yaroslavl and the Dnieper to the mouth of the Dvina, a distance of 650 m., in summer; but its navigability is not sufficient for the serious traffic of Russia. Its current in summer is fairly moderate, but from March to October the river is subject to great fluctuations of current, dependent on the state of the Caspian sea and the Kama, which join the Volga at Kazan. 

1 To the Voytaks it is known as the Budzh-kin. To the Chuvash it is known as the Shoja-agil, and to the Tatars as the Cholman-ideil or Ak-ideil, all words signifying "White river."
Along the next 375 m. of its course the Volga—now 580 to 2500 yds. wide—flows south-west and south-west, with but one great bend at Samara.

The Samara bend.

At this point, where it pierces a range of limestone hills, the river is anastomosed by a large number of tributaries, all of which is the delta of the river is very picturesque, fringed as it is by cliffs which rise 1000 ft. above the level of the stream (which is only 54 ft. above the sea at Samara). Along the whole of the Samara bend the Volga is accompanied on its right bank by high cliffs which it is constantly and in some places by broad lowland areas stretch along the left or eastern bank, and are intersected by several old beds of the Volga.

At Tsaritsyn the great river reaches its extreme south-western limit, and there is separated from the Caspian sea by an isthmus only 45 m. in width. The isthmus is too high to be crossed by means of a canal, but a railway to Kalat brings the Volga into some sort of connection with the Don and the Sea of Azov. At Tsaritsyn the river takes a sharp turn in a south-easterly direction towards the Caspian; it enters the Caspian steppes, and a few miles above Tsaritsyn sends off a branch—the Akhtuba—which accompanies it for 330 m. before falling into the Caspian. Here the Volga receives no tributaries; its right bank is skirted by low hills, but on the left it anastomoses freely with the Akhtuba when its waters are high, and floods the country for 15 to 35 m. The width of the main stream ranges from 550 to 3500 yds. and the depth exceeds 80 ft. The delta proper begins 40 m. above Astrakhan, and the branches subdivide so as to reach the sea by as many as 200 separate mouths. Below Astrakhan navigation is difficult, and on the sand-bars at the mouth the maximum depth is only 12 ft. in calm weather.

The figures given show how immensely the river varies in volume, and the greatness of the changes which are constantly going on in the channel and on its banks. Not only does its level occasionally rise in flood as much as 50 ft. and overflow its banks for a distance of 5 to 15 m.; even the level of the Caspian, which is only affected by the sudden rise and fall brought by the Volga. The amount of suspended matter brought down is correspondingly great. All along its course the Volga is eroding and destroying its banks with great rapidity; towns and loading ports have constantly to be shifted farther back.

The question of the gradual desiccation of the Volga, and its causes, has often been discussed, and in 1838 a committee which included Karl Baer among its members was appointed by the Russian academy of sciences to investigate the subject. No positive result was, however, arrived at, principally on account of the want of regular measurements of the volume of the Volga and its tributaries—measurements which began to be made on scientific principles only in 1880. Still, if we go back two or three centuries, it is indisputable that rivers of the Volga basin which were easily navigable then are now hardly accessible to the smallest craft. The desiccation of the rivers of Russia has been often attributed to the steady destruction of its forests. But it is obvious that there are other general causes at work, which are of a much more important character, as for instance the steady rise of the Caspian sea, which is the principal cause of the general desiccation of Eastern and Western Turkestan are contemporaneous manifestations. The gradual elevation of the whole of northern Russia and Siberia, and the consequent draining of the marshes, is one of these deeper-seated, ampler causes; another is the desiccation of the lakes all over the northern hemisphere.

Fisheries.—The network of shallow and still limans or "cut-offs" in the delta of the Volga and the shallow waters of the northern Caspian, where these are by far the largest of the Russian fish, the Kura and the Terek, is exceedingly favourable to the breeding of fish, and as a whole constitutes one of the most productive fishing grounds in the world. As soon as the ice breaks up in the delta, in late April (Luciottutia leucichthys), which is formerly neglected, but has now become more important than sturgeon; the sturgeon A. stellatus and "wels" (Silurus glanis) follow, and finally the sturgeon Anguilla, which is so much talked of for its caviar and as a food. A gravelly spawning-ground the sturgeon go up the river as far as Saratov (250 m.). The lamprey, now extensively pickled, the sterlet (A. ruthenus), the tench, the gudgeon and other species are immensely important. It is estimated that 180,000 tons of fish of all kinds, of the value of considerably over 1,500,000, are taken annually in the four fishing districts of the Volga, Ural, Terek and Kura. Seal-hunting is carried on off the Volga mouth, and every year about 40,000 of Phoca vitulina are killed to the north of the Manghishlak peninsula on the east side of the Caspian.

Ice Changes.—In winter the numberless tributaries and sub-tributaries of the Volga become highways for sledges. The ice lasts 90 to 160 days, and breaks up earlier in its upper course than in some parts lower down. The average date of the break-up is April 11th at Yar, and 14 days later at Kronstadt and St. Petersburg. The upper river traffic consists chiefly of manufactured goods and timber, the latter mostly for the treeless governments of Samara, Saratov and Astrakhan, as well as for the region adjacent to the lower course of the Don. Drifting fisherman and the numerous whalers who are stationed near the most dangerous sandbanks to assist vessels that run aground. The following table shows the principal river ports, with the movement of shipping in an average year:

Formerly tens of thousands of buraki, or potteries, were employed in dragging boats up the Volga and its tributaries, but this method of traction has disappeared unless from a few of the tributaries. Horse-power is still extensively resorted to along the three canal systems. The first large steamers of the American type were built in 1872. Thousands of steamers are now employed in the traffic, to say nothing of smaller boats and rafts. Many of the steamers use as fuel mazut or petroleum refuse. Large numbers of the boats and rafts are broken up after a single voyage.

History.—The Volga was not improbably known to the early Greeks, though it is not mentioned by any writer previous to Ptolemy. According to him, the Rha is a tributary of an interior sea, formed from the confluence of two great rivers, the sources of which are separated by twenty degrees of longitude, but it is scarcely possible to judge from his statements how far the Slavs had by that time succeeded in penetrating into the basin of the Volga. The Arab geographers throw little light on the condition of the Volga during the great migrations of the 3rd century, or subsequently under the invasion of the Huns, the growth of the Khazar empire in the southern steppes and of that of Bulgaria on the middle Volga. But we know that in the 9th century the Volga was a navigable river by Khazars and various Turkish races in the south. The Slavs, driven perhaps to the west, had only the Volkov and the Dnieper, while the (Mohammedan) Bulgarian empire, at the confluence of the Volga with the Kama, was so powerful that for some time it was an open question whether Islam or Christianity would gain the upper hand among the Slav idolaters. But, while the Russians were driven from the Black Sea by the Khazars, and later on by a tide of Ugrian migration from the north-east, a stream of Slavs moved slowly towards the north-east, down the upper Oka, into the backwaters between the Finnish and Samogitian regions. After two centuries of struggle the Russians succeeded in colonizing the fertile valleys of the Oka basin; in the 15th century they built a series of fortified towns on the Oka and Klyazma; and finally they reached the mouth of the Oka, there founding (in 1122) a new Novgorod—the Novgorod of the Lowlands, now Nizhny-Novgorod. The great lachrymose depression of the middle Volga was thus reached; and when the Mongol invasion of 1239-42 came, it encountered in the Oka basin a dense agricultural population with no signs of military resistance which the Mongols found they could conquer, indeed, but were unable to drive before them as they had done so many of the Turkish tribes.
This invasion, checkmate by the Germans, did not stop the advance of the Russians down the Volga. Two centuries elapsed before the Russians crossed the river and which separate the mouths of the Oka and the Kama and took possession of Kazan. But in the meantime a flow of Novgorodian colonization had moved eastward, along the upper portions of the left-bank tributaries of the Volga, and had reached the Ural.

With the capture of Kazan (1552) the Russians found the lower Volga open to their boats, and eight years afterwards they were masters of the mouth of the river at Astrakhan. Two centuries more elapsed before the Russians secured a free passage to the Black Sea and became masters of the Sea of Azov. The town of Wellstown maintains this free distribution and was that which Volodymyr Semenov's company used to sell their goods to the merchants of Petersburg, not the city itself.

The Germans in Wellstown was called New Lublin (1200 ft. above the town) was a center of the trade of amber and salt, and was on one of the roads along which the traffic was carried. It is called Wellstown.

VOLHYNIA—VOLLMAR

VOLHYNIA, a government of south-western Russia, bounded by the Polish governments of Lublin and Siedloc on the W., Grodno and Minsk on the N., Kiev on the E. and Podolia and Galicia (Austria) on the S., with an area of 27,690 sq. m. A broad, flat spur of the Carpathians—the Avratynsk plateau—which enters from the west and stretches out eastward towards the Dnieper occupies its southern portion, reaching a maximum elevation of 1200 ft.; another branch of the Carpathians in the west of the government ranges between 700 and 900 ft. at its highest points. Both are deeply grooved in places, and the average gives a hilly aspect to the district in which they occur. The remainder of the government, which is quite flat, with an imperceptible slope towards the marshes of Pinnk, is known as the Polyesie (see Minsk).

The population in 1906 was estimated at 3,547,500. Some three-fourths of the population are Little Russians; the other elements are White and Great Russians, Poles (5.2%), Jews (13.2%) and Germans (5.7%). The government is divided into twelve districts, the chief towns of which are Zhitomir, the capital, Dubno, Kovel, Kremenets, Lutsk, Nizhny Novgorod, Volynsky, Ostrog, Ovruch, Vladimir Volynsky, Rovno, Staro-Konstantinov and Zaslaw. The conditions of peasant ownership differ from those which prevail in other parts of Russia, and of the total area the peasants hold approximately one-half; 42% of the total is in the hands of private owners, a considerable number of Germans having settled and bought land in the government.

Forests cover nearly 90% of the area in the north (that is, in the Polissia) and 15% elsewhere. Agriculture is well developed in the south, and in 1906 there were 2,223,000 acres (24%) under cereal crops alone. In the Polyesie the principal occupations are connected with the export of timber and firewood, the preparation of products of wood and the manufacture of and wood furniture. Lignite and coal, some graphite and kaolin, are mined, as also amber, which is often found in big lumps. Manufacturing industries are not very highly developed. The factories are confined to sugar works, distilleries, and railroad ways, tobacco, paper, and agro-cultural machinery works. Domestic industry in the villages is chiefly limited to the making of wooden goods, including parquets. The production of tobacco and timber, chiefly to Germany and Great Britain, and of wool and flax, are considerable.

Vohynia has been inhabited by Slavs from a remote antiquity. In Nestor's Annals its people are mentioned under the name of Duels, and later in the 12th century they were known as Velhynians and Buzhans (dwellers on the Bug). From the 9th century the towns of Velhynia-Vladimir, Ovruch, Lutsk and Dubno were ruled by descendants of the Scandinavian or Varangian chief Rurik, and the land of Velhynia remained independent until the 14th century, when it fell under Lithuania. In 1569 it was annexed to Poland, and so remained until 1795, when it was taken possession of by Russia.

VOLK, LEONARD WELLS (1826–1899), American sculptor, was born at Wellstown (now Wells), Hamilton county, New York, on the 7th of November 1828. He first followed the trade of a marble cutter with his father at Pittsfield, Massachusetts. In 1848 he opened a studio at St Louis, Missouri, and in 1855 was sent by his wife's cousin, Stephen A. Douglas, to Rome to study. Returning to America in 1857, he settled in Chicago, where he helped to establish an Academy of Design and was for eight years its head. Among his principal works at Chicago was the Douglas monument at Chicago and the Soldiers' and Sailors' monument at Rochester, New York, and statues of President Lincoln and Stephen A. Douglas (in the Illinois State Capitol at Springfield, III.), and of General James Shields (in Statuary Hall, Capitol, Washington), Elijah B. Washburn, Zachariah Chandler and David Davis. In 1860 he made a life-mask (now in the National Museum, Washington) of Lincoln, of whom only one other, by Clark Mills in 1865, was ever made.

His son, Douglas Volk (b. 1856), figure and portrait painter, who studied under J. L. Gérôme in Paris, became a member of the Society of American Artists in 1880 and of the National Academy of Design in 1889.

VOLKSRUST, a town on the Transvaal, 75 m. S.E. of Johannesburg and 308 m. N.N.W. of Durban. Pop. (1904) 2382, of whom 1342 were whites. The town lies at an elevation of 3520 ft. just within the Transvaal frontier and 4 m. N. of the pass through the Drakensberg known as Laing's Nek. It is the centre of a rich agricultural district. It was founded by the Boer government in 1885. As a customs port of entry it was of some importance, and it maintains its position as a distributing depot. It was created a municipality in 1903. Volkmarsen is quarried in the district.

VOLLENHEIM, a small village of Holland in the province of North Holland, adjoining Edam on the shores of the Zuider Zee. It is remarkable for the quaintness of the buildings and the picturesque costume of the villagers, who are of a singularly dark and robust type. Many artists have been attracted to settle here. Vollenhove has its origin in the building of the great sea-dam for the new waterway to Edam in the middle of the 14th century. On the seaward side of the dike are some houses built on piles in the style of lake dwellings.

VOLLMAR, GEORG HEINRICH VON (1830–90), German Socialist, was born at Munich in 1830. He was educated in a school attached to a Benedictine monastery at Aschaffenburg, and in 1855 entered the Bavarian army as a lieutenant in a cavalry regiment. He served in the campaigns of 1859 and 1860, and then entered the papal army as a volunteer. In 1869 he returned to Germany, and during the war with France served in the army railway department. He was severely wounded at Blois and pensioned. Permanently crippled by his wounds, he devoted himself to political and social studies. In 1872 he was converted to the principles of Social Democracy, and threw himself with great energy into political agitation. In 1877 he became head of the party at Dresden, and under the Socialist law was repeatedly condemned to various terms of imprisonment, and was also expelled from that city. From 1879 to 1882 he lived at Zürich, then the headquarters of Social Democracy, where, besides attending the university, he took part in editing the Social Demokrät. In 1881 he was elected member of the Reichstag, and from 1883 to 1889 was a member of the Saxon diet. After 1885 he resided in Bavaria, and it was to him that was chiefly due the great success of the Socialists in the older Bavarian provinces. He identified himself with the more moderate and opportunist section of the Socialist party, decisively dissociating himself from the doctrine of a sudden and violent overthrow of society, and urging his associates to co-operate in bringing about a gradual development towards the Socialist state. He refused to identify Social Democracy with the extreme views as to religion and the family advocated by Bebel, and successfully resisted attempts made in 1891 to expel him from
the party in consequence of his opinions. He became a member of the Bavarian Diet in 1893.

In addition to a couple of books on the preservation of forests, he published Der isolierte Soziale Staat (Zürich, 1889).

**VOLNEY, CONSTANTIN FRANÇOIS CHASSÉBOURG, COMTE DE** (1753-1820). French savant, was born at Creuse (Maine-et-Loire) on the 3rd of February 1753, of good family; he was at first surnamed Boisgrais from his father's estate, but afterwards assumed the name of Volney. He spent some four years in Egypt and Syria, and published his Voyage en Égypte et en Syrie in 1787, and Considérations sur la guerre des Turcs et de la Russie in 1788. He was a member both of the States-General and of the Constituent Assembly. In 1791 appeared Les Ruines, ou méditations sur les révolutions des empires, an essay on the philosophy of history, containing a vision which predicts the final union of all religions by the recognition of the common truth underlying them all. Volney tried to put his politico-economic theories into practice in Corsica, where in 1792 he bought an estate and made an attempt to cultivate colonial produce. He was thrown into prison during the Jacobin triumph, but escaped the guillotine. He was some time professor of history at the newly founded École Normale. In 1795 he undertook a journey to the United States, where he was accused in 1797 of being a French spy sent to prepare for the reoccupation of Louisiana by France. He was obliged to return to France in 1798. The results of his travels took form in his Tableau du climat et du sol des États-Unis (1803). He was not a partisan of Napoleon, but, being a moderate man, a savant and a Liberal, was impressed into service by the emperor, who made him a count and put him into the senate. At the restoration he was made a peer of France. He became a member of the Institute in 1795. He died in Paris on the 25th of April 1820.

**VOLO** (Second Part), a town and seaport of Greece, on the east coast of Thessaly, at the head of the gulf to which it gives its name. Pop. (1907) 23,319. It is the chief seaport and second industrial town of Thessaly, connected by rail with the town of Larissa. The anchorage is safe, vessels loading and discharging by means of lighters. The port has a depth of 23 to 25 ft.

The *Kastri*, or citadel, of Volos stands on or close to the site of Pagasa, whence the gulf took the name of Sinus Pagassaeus or Pagasicus, and which was one of the oldest places of which mention occurs in early history and legend. From Pagasa a Phoenician Argonautic expedition was said to have sailed, and it was already a flourishing place under the tyrant Jason, who from the neighbouring Phereae ruled over all Thessaly. Two miles farther south stand the ruins of Demetrias, founded (200 B.C.) by Demetrius Poliorcetes, and for some time a favourite residence of the Macedonian kings. On the opposite side of the little inlet at the head of the gulf rises the high mountain which stands over the ancient city of Iocasus. At Dimini, about 3 m. W. of Volos, several tombs have been found and which yielded remains of the later Mycenean Age.

**VOLOGASES (Vologaes, Vologasae; on the coins Ologases; Armen. Valarst; Mod. Pers. Balash), the name of five Parthian kings.**

1. **VOLOGASES I.**, son of Vonones II. by a Greek concubine (Tac. Ann. xii. 44), succeeded his father in A.D. 51 (Tac. Ann. xii. 14; cf. Joseph. Ant. xx. 3, 4). He gave up the kingdom of Media Atropatene to his brother Pacorus, and occupied Armenia for another brother, Tiridates (Tac. Ann. xii. 50, xv. 2; Joseph. Ant. xx. 3, 4). This led to a long war with Rome (54-63), which was ably conducted by the Roman general Corbulo. The power of Vologases was weakened by the attack of the Dahan and Sacan nomads, a rebellion of the Hyrcanians, and the usurpation of Vardanes II. (Tac. Ann. xii. 7, 37; xiv. 25; xv. 1; cf. Joseph. Ant. xx. 4, 2, where he is prevented from attacking the vassal king of Sacania by an intervention of the eastern nomads). At last a peace was concluded, by which Tiridates was acknowledged as king of Armenia, but had to become a vassal of the Romans; he went to Rome, where Nero gave him back the diadem (Tac. Ann. xv. 1 ff.; Dio Cass. lixi. 19 ff., lxiii. 1 ff.); from that time an Arsacid dynasty ruled in Armenia under Roman supremacy. Vologases was satisfied with this result, and honoured the memory of Nero (Suet. Ner. 57), though he stood in good relations with Vespasian also, to whom he offered an army of 40,000 archers in the war against Vitellius (Tac. Hist. iv. 51; Suet. Vespas. 6; cf. Joseph. Ant. vii. 5, 2, 7, 5; Dio Cass. lixi. 11). Soon afterwards the Alani, a gold nomadic tribe beyond the Caucasus, invaded Media and Armenia (Joseph. Bell. vii. 7, 4; 4); Vologases applied in vain for help to Vespasian (Dio Cass. lixi. 11; Suet. Tit. Domit. 2). It appears that the Persian losses in the east also could not be repaired; Hryciana remained an independent kingdom (Joseph. Bell. vii. 7, 4; Aurel. Vict. Epit. 15, 4). Vologases I. died about A.D. 77. His reign is marked by a decided reaction against Hellenism; he built Vologosesca (Balashkert) in the neighbourhood of Ctesiphon with the intention of drawing to this new town the inhabitants of the Greek city Seleucia (Plin. vii. 222). Another town founded by him is Vologesiana on a canal of the Euphrates, south of Babylon (near Him; cf. Nödlke in Zeitschrift der deutschen-morgeng. Gesellschaft, xxviii. 93 ff.). On some of his coins the initials of his name appear in Arabic letters.

2. **VOLOGASES II.**, probably the son of Vologases I., appears on coins, which bear his proper name, in 77-70, and again 121-47. During this time the Parthian kingdom was torn by civil wars between different pretenders, which reached their height during the war of Trajan, 114-17. Besides Vologases II. we find four coins in the authors Pacorus (178-186), Artabazus (186-97), Vologases III. (807), Osroes (196-205), Mithridates V. (c. 195-47) and some others; thus the Parthian empire seems during this whole time to have been divided into two or three different kingdoms. By classic authors Vologases II. is mentioned in the time of Hadrian (c. 131), when Capadocia, Armenia and Media were invaded by the Alani (Dio Cass. lixix. 15).

3. **VOLOGASES III.**, 147-91. Under him, the unity of the empire was restored. But he was attacked by the Romans under Marcus Aurelius and Verus (162-65). In this war Seleucia was destroyed and the palace of Ctesiphon burnt down by Avidius Cassius (164); the Romans even advanced into Media. In the peace, western Mesopotamia was ceded to the Romans (Dio Cass. lixix. 1 f.; Capitolin. Marc. Aur. 8 f.; Verus 8 f., &c.). Vologases III. is probably the king Volgas of the Parsee tradition, preserved in the Dinkart, who began the gathering of the writings of Zoroaster.

4. **VOLOGASES IV.**, 191-209. He was attacked by Septimius Severus in 195, who advanced into Mesopotamia, occupied Nisibis and plundered Ctesiphon (199), but attempted in vain to conquer the Arabic fortress Atra; in 202 peace was restored. Soon after his accession his brother Artabanus IV., the last Arsacid king, rebelled against him, and became master of the greater part of the empire (Dio Cass. lixixii. 12). But Vologases V. maintained himself in a part of Babylonia; his dated coins reach down to A.D. 222. (Ed. M.)

**VOLOGDA**, a government of north-eastern Russia, having the government of Archangel on the N., Tobolsk on the E., Perm, Vyatka, Kostroma and Yaroslavl on the S., Novgorod, Olonets and Archangel on the W. This immense government, which, as it comprises an area of 1,218,000 square miles, is almost one-third of the whole empire, extends in a north-easterly direction for 800 m., from Novgorod to the Urals, and includes the broad depression drained by the Sukhona from the S.W., and the Yychegda from the N.E., both head-waters of the N. Dvina. From the basin of the Volga it is separated by a flat, swampy, wooded swelling, where the heads of tributaries belonging to both Arctic and Caspian drainage-areas are closely intermingled. The eastern boundary of Volgoda follows the main water-parting of the Urals, which has but few peaks over 1300 ft.; wide parnas, or woody plateaux, rest up the space between the main chain of the Urals and the southern spurs of the Timan Mountains, in the upper basin of the Pechora. It is above the parnas—especially those over which are nearest the Urals proper—that the highest summits of the Urals rise in the form of dome-shaped mountains (Toll-pož-iz, 5535 ft.; Kožhem-iz, 4225 ft.; Shadamaha, 4115 ft.). The Timan
Mountains are a swampy plateau, where the rivers flowing to the N. Dvina or to the Pechora take their rise in common marshes; so that on the Mylva portage boats have to be dragged a distance of only 3 m. to be transported from one system to the other.

Perman sandstones and cupferiferous slates cover most of the territory; in patches of Jurassic clay overlie them; in the east, in the Ural *parmas*, coal-bearing Carboniferous, Devonian and Silurian slates and limestones appear, wrapping the crystalline slates of the foundation; the sands, clay, loam and Lias beds overlap the whole. Rock-salt and salt springs, iron ore, millstones and grindstones are the chief mineral products; but mining is in its infancy.

The Dvina, which rises in the south-west and flows north-east, is navigable for 375 m. After its confluence with the Yug (390 m. long), which flows from the south, it becomes the N. Dvina, which proceeds north-west, and receives the Volga, 740 m. long and navigable for 570 m., though it passes through a nearly uninhabited region. The Luza, a tributary of the Yug, is also navigated for more than 250 m. The Pechora, which flows through eastern Vologda, is an artery for the export of corn and the import of fish. The Pingea, the Mezen and the Vaga, all belonging to the Arctic basin, rise in northern Vologda. In the south-west the Sukhona is connected by means of Lake Kubina and the canal of Alexander the Great with Lake Ladoga. Its course through smaller lakes occurs, and marshes cover a considerable part of the surface.

The climate is severe. The average annual temperature being 36° in Vologda (Jan., 19°; July, 63°) and 32°-35° at Ust-Syosolsk (Jan., 4°-8; July, 61°-7).

The flora and the physical aspects vary greatly as the traveller moves north-eastward. The *parmas* of the Pechora. In the south-west the forests are cleared, and the dry slopes of the hills have been converted into fields and meadows; the population is relatively dense, and nearly one-quarter of the area is cultivated. There is a surplus of grain, especially rye, which is used for distilleries, and apples are extensively cultivated. The flora is middle-Russian. Further north-east the climate grows more severe; but still, until the Dvina is reached, corn succeeds well, and there is no lack of excellent meadows on the river-terras. Flax is cultivated for export; but only 4% of the area is tilled, the remainder being covered with thick fir forests with occasional groups of deciduous trees (birk, aspen, oak). At 40° E. the larch forest is no longer accompanied by fir. Several plants unknown in western Russia make their appearance (*Silene tartarica, Anthyllis vulneraria, Euphorbia palustris, Filipago arenaria, Lycopodium complanatum, Sanguisorba officinalis*). The *Verem* is especially characteristic; it sometimes encroaches on the meadows to such an extent as to compel their abandonment. The region of the upper Mezen (the Udora) again has a distinctive character. The winter is severe; the snow lies on the ground for 100 days; the springs are sometimes compelled to clear away the snow from their barley-fields. But the summer is so hot (a mean of 54° for the three summer months) that barley ripens in 30 days, being ready for harvest. The Timan plateau is a marked boundary for the middle-Russian flora.

Those to the east of them are uninhabitable; even on the banks of the rivers the climate is so severe, especially on account of the dry winds, that most of the land is cleared and large hayfields and orchards. The whole is covered with quite impenetrable forests, growing on a soil saturated with water. Mosquitoes swarm in the forests; birds are rare. The Siberian cedar begins and the lime trees disappear. Fir, cedar, pine and larch compose the forests, with birch and aspen on their outskirts. Hunting is the chief occupation of the Syryenian inhabitants.

The population was estimated in 1906 at 1,517,500, of whom 57,407 lived in towns; 90% were Great Russians and 50% Syryenians. The population is divided into ten districts, the chief towns of which are Vologda, Gwyjatk, Latski, Nikolsk, Svolychegodsk, Totma or Totyma, Ustyug Velikiy, Ust-Syosolsk, Velik and Yarenok. The agriculture thrives in the south-western districts. Live-stock breeding occupies considerable numbers of people. A little salt is raised, and there are a few ironworks, but manufacturing industries are in their infancy; the chief branch is the weaving of linen in the villages.

Vologda, a town of Russia, capital of the government of the same name, situated in its south-east corner on the river Vologda, above its confluence with the navigable Suiker; 127 m. by rail N. of Yaroslav. Pop. (1887) 17,025; (1897) 27,822. It is an old town, having many ancient churches, including one which dates from the 12th century, and the cathedral, founded in 1568. Vologda is a considerable commercial centre—flax, fished, oats, hemp, butter and eggs being exported to both St Petersburg and Archangel. It has distilleries, tanneries, and oil, soap, tobacco, candle and furnishing works.

Vologda existed as a trading town as early as the 12th century. It was a colony of Novgorod, and was founded in 1147, and carried on a brisk trade in furs, salt, flax, sugar, corn, etc. In 1273 it was plundered by the prince of Tver in alliance with the Tatars, but soon recovered. Moscow disputed its possession with Novgorod until the 15th century; the Moscow princes intrigued to find support amidst the poorer inhabitants against the richer Novgorod merchants, and four successive times Vologda had to fight against its metropolis. It was definitely annexed to Moscow in 1447. When Archangel was founded, and opened for foreign trade in 1533, Vologda became the chief depot for goods exported through that channel. Polish bands plundered it in 1613, and the plague of 1648 devastated it; but it maintained its commercial importance until the foundation of St Petersburg, when Russian foreign trade took another channel.

VOLSCI, an ancient Italian people, well known in the history of the first century of the Roman Republic. They inhabited the partly hilly, partly marshy district of the S. of Latium, bounded by the Aurunci and Samnites on the S., the Hernici on the E., and stretching roughly from Norba and Cora in the N. to Antium in the S. They were among the most dangerous enemies of Rome, and frequently took part in the great feuds of the Hernici, with whom they were often at war. At the same time their relations with the Latin towns were friendly. In the Samnium Wars, and later, when the Hernici were submitted, their lands formed part of the Latium of Rome. The territory lay between the towns of Vernalia (Vellertii), the birthplace of Augustus. From this town we have a very interesting though brief inscription dating probably from early in the 3rd century B.C.; it is cut upon a small bronze plate (now in the Naples Museum), which must have once been fixed to some votive object, dedicated to the god Decluns (or the goddess Decluna).

The language of this inscription is clear enough to show the very marked peculiarities which rank it close beside the language of the Iguvine Tables (see *Icuvium*). It shows on the hand the localization of the original velar *g* (Volscan *pis* = Latin *quis*), and on the other hand it palatalizes the guttural *c* before a following *i* (Volscan *facia* = Latin *faciat*). Like Umbrian also, but unlike Latin and Oscian, it has degraded all the diphthongs into simple vowels (Volscan *se* parallel to Oscan *sai*; Volscan *dene*, Old Latin and Oscan *detuai* or *detuari*). This phenomenon of what might have been taken for a piece of Umbrian text appearing in a district remote from Umbria and hemmed in by Latine on the north and Oscan-speaking Samnites on the south is a most curious feature in the geography of the Illyrian and most of the Italic dialects, and is clearly the result of some complex historical movements.

In seeking for an explanation we may perhaps trust, at least in part, the evidence of the Ethnicon itself. The name *Volsci* belongs to what may be called the -CO- group of tribal names in the centre, and mainly on the west coast, of Italy, all of whom were subdued by the Romani before the end of the 4th century B.C. ; and many of whom were conquered by the Samnites about a century or more earlier. They were, from south to north, Osci, *Umbri*, Etrusc, Volsci, with whom there was no doubt associated the original inhabitants of *Aricia* and of *Sidici-num*, of *Vescia* among the *Aurunci*, and of *Labici* close to Hernic territory. The same formative element appears in the adjective *Mons Massicus*, and the names *Glancio* and *Morico* belonging to the Auruncean district, with *Gratisciae* in south Etruria, and a few other names in central Italy (see "I due strati nella popolazione Indo-Europea dell' Italia Antica," in *Attis del Congresso Internazionale di Storie Sotlie*, Rome, 1903, p. 17). With these names must clearly be judged the forms *Tusci* and *Etrusi*, although these forms must not be regarded as anything but the names given to the Etruscans by the folk among whom they settled. Now the historical fortune of these tribes is reflected in several of their names (see *Sabin*). The Samnite and Roman conquerors tended to impose the form of their own Ethnicon, namely the suffix -NO-,
the tribes they conquered; hence the Marrucini became the Marruci, the *Ariici became Articini, and it seems at least probable that the forms Sidicini, Corecini, and others of this shape are the results of this same process. The conclusion suggested is that these -CO tribes occupied the centre and west coast of Italy at the time of the Etruscan invasion (see *ETRURIA: Language); whereas the -NO tribes only reached this part of Italy, or at least only became dominant there, long after the Etruscans had settled in the Peninsula to which they had previously been transferred.

It remains, therefore, to ask whether any information can be had about the language of this primitive -CO folk, and whether they can be identified as the authors of any of the various archaeological strata now recognized on Italian soil. If the conclusions suggested under Sarbini may be accepted as sound we should expect to find the Volsci speaking a language similar to that of the Ligures, whose fondness for the suffix -so- we have noticed (see *LIGURES), and identical with that spoken by the plebeians of Rome; and that this branch of Indo-European was among those which preserved the original Indo-European Velars (sqq.).

In that of *Volus- *volus- is phonetically regular in Latin. The name Marciaco (*godess of the salt-marshes*) among the Aurunci appears also both on the coast of Picenum and among the Ligurians; and Stephanus of Byzantium identified the Osic with the Siculi, whom there is reason to suspect were kinmen of the Ligures.

It is remarkable in how many marshy places this *co-* or -ca-suffix is used. Besides the Aurunci and the dea Marica and the intertemporacque Gratiae (Virg. Aen. x. 184), we have the *Ustica cubani* of Horace (Odes i. 17, 11), the *Hercini* in the Trerus valley, *Satricum* and *Glosina* in the Pompeite marshes.

For the text and fuller account of the Volscian inscription, and for other notes of the dialect, see R. S. Conway, The Italian Dialects, pp. 267 sqq.

**VOLSIINI, an ancient town of Etruria, Italy.** The older Volscia occupied in all probability the isolated tufo rock, so strongly defended by nature, upon which in Roman times stood the town which Procopius (B.G. ii. 11 seq.) calls *Ophiopetros* (Urbs vetus, the modern Orvieto). This conjecture, first made by O. Muller, has been generally accepted by modern archaeologists; and it is a strong point in its favour that the bishop of Orvieto in 595 signs himself episcopus civitatis Bolsinensis (Gregor. Magn. Regist. v. 57a; cf. ii. 11, vi. 27). It had, and needed, no outer walls, being surrounded on all sides except the S.W. by abrupt tufo cliffs; but a massive wall found by excavation on the S.W. side of the town may have belonged to the acropolis. No remains of antiquity are to be seen within the city; but at the foot of the hill on the N. a large Etruscan necropolis was found in 1874, dating from the 5th century B.C. The tombs, constructed of blocks of stone and arranged in rows divided by passages (like houses in a town), often had the name of the deceased on the façade. Many painted vases, &c., were found; some of the best are in the Museo Civico at Orvieto. Tombs with paintings have also been found to the W. of the town on the way to Bolsena.

Volsci was reputed the richest of the twelve cities of Etruria. Wars between Volscia and Rome are mentioned in 592, 208 and 294 B.C., and in 265-64 B.C. the Romans assisted the inhabitants against their former slaves, who had successfully asserted themselves against their masters and took the town. Fulvius Flaccus gained a triumph for his victory, and it was probably then that the statue of Vertumnus which stood in the Vicus Tuscus at Rome was brought from Volsci. Zonaras states that the city was destroyed and removed elsewhere, though the old site continued apparently to be inhabited, to judge from the inscriptions found there. The new city was certainly situated on the hills on the N.E. bank of the Lake of Bolsena (*Lacus Volsciensis*), 12 m. W.S.W. of Orvieto, where many remains of antiquity have been found, on and above the site of the modern Bolsena (q.v.). These remains consist of Etruscan tombs, the sacred enclosure of the goddess Nortia, with votive objects and coins ranging from the beginning of the 3rd century B.C. to the middle of the 3rd century A.D., remains of Roman houses, &c., and an amphitheatre of the imperial period (E. Gabrici in Monumenti dei Lancisi, xvi, 1906, 169 sqq., and in Notizie degli Scavi, 1906, 59 sqq.).

The history of the new Volsci is somewhat scanty. Sejanus, the favourite of Tiberius, and Musonius Rufus the Stoic were natives of the place. The earliest dated inscription from the cemetery of S. Christina (discovered with its subterranean church in 1880-81) belongs to A.D. 376 and the first known bishop of Volsci to A.D. 499. In the next century, however, the see was transferred to Orvieto. Etruscan tombs have been found on the Isola Biscinta, in the lake; and on the west bank was the town of Visentium, Roman inscriptions belonging to which have been found. The site is marked by a medieval castle bearing the name Bisesanu.

See E. Bornman in Corp. Inscr. Latin. xi, 1888, pp. 423 sqq.; Notizie degli Scavi, passim; G. Dennis, op. cit. (ii. 18 sqq.).

(T. As.)

**VOLTA, ALESSANDRO (1745-1827),** Italian physicist, was born at Como on the 18th of February 1745. He is celebrated as a pioneer of electrical science, after whom the "volt" is named. In 1774 he was appointed professor of physics in the gymnasium of Como, and in 1777 he travelled through Switzerland, where he formed an intimate friendship with H. B. de Saussure. In 1779 a chair of physics was founded in Pavia, and Volta was chosen to occupy it. In 1782 he journeyed through France, Germany, Holland and England, and became acquainted with many scientific celebrities. In 1791 he received the Copley medal of the Royal Society. In 1807 Napoleon called him to Paris, to show his experiments on contact electricity, and a medal was struck in his honour. He was made a senator of the kingdom of Lombardy. In 1815 the government of Austria made him director of the Royal Technological School and professor of physics at the University of Padua. He retired in 1819 and settled in his native town, where he died on the 5th of March 1827. For Volta's electrical work, and his place in the history of discovery (see *ELECTRICITY; also VOLTMETER*).

**VOLTA, the largest river of the coast of Upper Guinea, between the Gambia and the Niger, with a length of about 900 m. Its mouth and the greater part of its course are in British territory. Its lower course had been known since the discoveries of the Portuguese, from whom it received (15th century) its name of Gambia. It runs through the forest and savannah regions to the coast of Guinea, its mouth is about 20 m. wide, and there are here great falls. So far as we can judge from the charting of the British, French and Spanish, it is navigable by small vessels.**

**There are two main upper branches, the Black and the White Volta. Their sources lie on the grassy plateaus north of the forest belt of the Guinea coast, the Black Volta rising (as the Baule) in about 17° N. latitude and the White Volta, which joins it at a point about 19° N. latitude, about 14° N. — the most northerly point of the basin,—it turns sharply south. From the vicinity of the ninth parallel the river forms the boundary between the Northern Territories of the Gold Coast (British) and the French Ivory Coast colony. The southerly course of the stream ceases at 8° 15' N. where it is deflected E., and even N., by a mountain range composed of sandstone and granite, which it finally breaks through by a narrow pass, in which its width is only some 60 yds.** Elsewhere
VOLTAIRE

it has a general width of 150 to 200 yards. In $o^\circ 50' W.$ it receives the White Volta, which flows generally south from about $13^\circ N.$ and like the other both serves to make an escape. Both rivers shrink greatly in the dry season, reaching their lowest level at the end of January. Below the junction the Volta flows S.E. and S., turning, however, E. for 40 m. just north of $1^\circ 37' N.$ It receives on the left bank a large tributary, the Oti, coming from $12^\circ N.$ In its lower course, through the forest belt, the river has often a width of over half a mile, with a depth in places of 60 to 90 ft. In the rains, but in $6^\circ 18' N.$ it traverses a pasture, and its width is narrowed to 30 yds. Its use as a water-way is limited by a number of rapids, the lowest of which occur in $6^\circ 7' N.$ above the trading port of Akuse. Its mouth is also obstructed during the greater part of the year by rocks and sandbars, and is usually navigable by small vessels from its mouth for about 60 m.

The lower Volta was explored by M. J. Bonnât in 1875, but the upper basin was first traversed by the German traveller G. A. Krause (1886-87) and the French captain L. G. Binger (1888). It has since been explored by a number of colonial officials—German, French and British.

VOLTAIRE, FRANÇOIS MARIE AROUET (1694-1778), French philosopher, historian, dramatist and man of letters, whose real name was François Marie Arouet simply, was born on the 21st of November 1694 at Paris, and was baptized the next day. His father was François Arouet, a notary; his mother was Marie Marguerite Daumont or D'Aumard. Both father and mother were of Poitevin extraction, but the Arouets had been for two generations established in Paris, the grand-father being a prosperous tradesman. The family appear to have always belonged to the yeoman-tradesman class; their special home was the town of Saint-Loup. Voltaire was the fifth child of his parents—twins (of whom one survived), a girl, Marguerite Catherine, and another boy who died young, having preceded him. Not very much is known of the mother, who died when Voltaire was but seven years old. She pretty certainly was the chief cause of his early introduction to good society, the abbé de Châteauneuf (his sponsor in more ways than one) having been her friend. The father appears to have been somewhat peremptory in temper, but neither inaptorial nor tyrannical. Marguerite Arouet, of whom her younger brother was very fond, married early, her husband's name being Mignot; the elder brother, Armand, was a strong Jan- senist, and there never was any kind of sympathy between him and François.

The abbé de Châteauneuf instructed him early in belles-lettres and deism, and he showed when a child the unsupervised faculty for facile verse-making which always distinguished him. At the age of ten he was sent to the Collège Louis-le-Grand, where he showed in some things so early and so great a faculty that many doubted whether he had not been educated by some Jesuits, and remained there till 1711. It was his whim, as part of his general liberal-ism, to depreciate the education he received; but it seems to have been a very sound and good education, which formed the basis of his extraordinarily wide, though never extraordinarily accurate, collection of knowledge subsequently, and (a more important thing) disciplined and exercised his literary faculty and judgment. Nor can there be much doubt that the great attention bestowed on acting—the Jesuits kept up the Renaissance practice of turning schools into theatres for the performance of plays both in Latin and in the vernacular, had much to do with Voltaire's lifelong devotion to the stage.

It must have been in his very earliest school years that the celebrated presentation of him by his godfather to Ninon de Lenclos took place, for Ninon died in 1705. She left him two thousand francs "to buy books with." He worked fairly, played fairly, lived comfortably, made good and lasting friends. Some curious traits are recorded of this life—one being that in the terrible famine year of Malpaquet a hundred francs a year were added to the usual boarding expenses, and yet the boys had to eat pain bis.

In August 1711, at the age of seventeen, he came home, and the usual battle followed between a son who desired no profession but literature and a father who refused to consider literature a profession at all. For a time Voltaire submitted, and read law at least nominally. The abbé de Châteauneuf died before his godson left school, but he had already introduced him to the famous and dissipated coterie of the Temple, of which the grand prior Vendôme was the head, and the poets Chaulieu and La Fare the chief literary stars. It does not appear that Voltaire got into any great scrapes; but his father tried to break him from French society by sending him first to Caen and then, in the suite of the marquis de Châteauneuf, the abbé's brother, to the Hague. Here he met a certain Olympe Dunoyer ("Pimpette"), a girl apparently of respectable character and not bad connexions, but a Protestant, penniless, and daughter of a literary lady whose literary reputation was not spotless. The mother discouraged the affair, and, though Voltaire tried to avail himself of the mania for proselytizing which then distinguished France, his father stopped any idea of a match by procuring a lettre de cachet, which, however, he did not use. Voltaire, who had been sent home, submitted, and for a time pretended to work in a Parisian lawyer's office; but he again manifested a faculty for getting into trouble—this time in the still more dangerous way of writing libellous poems—so that his father was glad to send him to stay for nearly a year (1714-15) with Louis de Caumont, marquis de Saint-Angé, in the country. Here he was still supposed to study law, but devoted himself in part to literary essays, in part to storing up his immense treasure of gossiping history. Almost exactly at the time of the death of Louis XIV. he returned to Paris, to fail of official favours by and by not only the marquis de Créquy, but by and by not only the marquis de Créquy, but to the tragedy of Édipe, which he had already written, privately known. He was now introduced to a less questionable and even more distinguished coterie than Vendôme's, to the famous "court de Sceaux," the circle of the beautiful and ambitious duchesse du Maine. It seems that Voltaire lent himself to the duchess's frantick hatred of the regent Orleans, and helped to compose lampoons on that prince. At any rate, in May 1716 he was exiled, first to Tulle, then to Sully. Allowed to return, he again fell under suspicion of having been concerned in the composition of two violent libels—one in Latin and one in French—called from their first words the Puero Regnante and the Æcie, was inveigled by a spy named Beuregard into a real or burlesque confession, and on the 16th of May 1717 was sent to the Bastille. He there recast Édipe, began the Henriade and determined to alter his name. Ever after his exit from the Bastille in April 1718 he was known as Arouet de Voltaire, or simply Voltaire, though legally he never abandoned his patronymic. The origin of the famous name has been much debated, and attempts have been made to show that it actually existed in the Daumont family, and to maintain that it was an abbreviation of a childish nickname, "le petit volontaire." The balance of opinion has, however, always inclined to the hypothesis of an anagram on the name "Arouet le jeune," or "Arouet l. j.," u being changed to v and j to i according to the ordinary rules of the game.

A further "exile" at Châteanay and elsewhere succeeded the imprisonment, and though Voltaire was admitted to an audience by the regent and treated graciously he was not trusted. Édipe was acted at the Théâtre Français on the 18th of November of the year of release, and was very well received, a rivalry between parties not dissimilar to that which not long before had helped Addison's Cato assisting its success. It had run of forty-five nights, and brought the author not a little profit. With these gains Voltaire seems to have begun his long series of successful financial speculations. But in the spring of next year the production of Lagrange-Chancel's libels, entitled the Philippiques, again brought suspicion on him. He was informally exiled, and spent much time with Marshal Villars, again increasing his store of reminiscences. He returned to Paris in the winter, and the second part of Henriade was pro- recast with some success Voltaire never published it as a whole, and used parts of it in other work. He again spent much of
his time with Villars, listening to the marshal's stories and making harmless love to the duchess. In December 1721 his father died, leaving him property (rather more than four thousand livres a year), which was soon increased by a pension of half the amount from the regent. In return for this, or in hopes of more, he offered himself as a spy—or at any rate as a secret diplomat—to Dubois. But meeting his old enemy Beauregard in one of the minister's rooms and making an offensive remark, he was waylaid by Beauregard some time after and carried off to England, ostensibly bearing a message to the Duke of Ancaster.

His visiting espionage, as unkind critics put it—his secret diplomatic mission, as he would have liked to have it put himself—began in the summer of 1722, and he set out for it in company with a certain Madame de Rupelmonde, to whom he as usual made love, taught deism and served as an amusing travelling companion. He stayed at Cambrai for some time, where European diplomats were still in full session, journeyed to Brussels, where he met and quarrelled with Jean Baptiste Rousseau, went on to the Hague, and then returned. The Henriade got on considerably during the journey, and according to its lifelong habit, the poet, with the help of his friend Thiriô and others, had been "working the oracle" of puffy. During the late autumn and winter of 1722–23 he abode chiefly in Paris, taking a kind of lodging in the town house of M. de Bernières, a nobleman of Rouen, and endeavouring to procure a "privilege" for his poem. In this he was disappointed, but he had the work printed at Rouen nevertheless, and spent the summer of 1723 revising it. In November he caught smallpox and was very seriously ill, so that the book was not given to the world till the spring of 1724 (and then of course, as it had no privilege, appeared privately). Almost at the same time, the 4th of March, his third tragedy, Mariamne appeared, was well received at first, but underwent complete damnation before the curtain fell. The regent had died shortly before, not to Voltaire's advantage; for he had been a generous patron. Voltaire had made, however, a useful friend in another grand seigneur, as prolific and nearly as intelligent, the duke of Richelieu, and with him he passed 1724 and the next year chiefly, recasting Mariamne (which was now successful), writing the comedy of L'Inquisiteur, and courting the queen on the ministry, the favours of which everybody who seemed worth. The end of 1725 brought a disastrous close to this period of his life. He was insulted by the chevalier de Rohan, replied with his usual sharpness of tongue, and shortly afterwards, when dining with the duke of Sully, was called out and bastinadoed by the chevalier's hirelings. Rohan himself looking on. Nobody would take his part, and at last, nearly three months after the outrage, he challenged Rohan, who accepted the challenge, but on the morning appointed for the duel Voltaire was arrested and sent, for the second time to the Bastille. He was kept in confinement a fortnight, and was then packed off to England in accordance with his own request. Voltaire revenged himself on the duke of Sully for his conduct towards his guest by cutting Maximi lien de Béthune's name out of the Henriade.

No competent judges have ever mistaken the importance of Voltaire's visit to England, and the influence it exercised on his future career. In the first place, the ridiculous and incredulous incident of the beating had time to blow over; in the second, England was a very favourable place for Frenchmen of note to pick up guineas; in the third, and most important of all, his contact with it was formed in every conceivable way from their neighbours than any two peoples of Europe are different now, acted as a sovereign tonic and stimulant on his intellect and literary faculty. Before the English visit Voltaire had been an elegant triñler, an adept in the forms of literature popular in French society, a sort of superior Dorat or Bouillers of earlier growth. He returned from it with that of the foremost literary men in Europe, with views, if not profound or accurate, yet wide and acute on all les grands sujets, and with a solid stock of money. The visit lasted about three years, from 1726 to 1729; and, as if to make the visitor's luck certain, George I. died and George II. succeeded soon after his arrival. The new king was not fond of "bovery," but Queen Caroline was, and international jealousy was pleased at the thoughts of welcoming a distinguished exile from French illiberality. The Walpoles, Bubb Dodington, Bolingbroke, Congreve, Sarah, duchess of Marlborough, Pope, were among his English friends. He made acquaintance with, and at least tried to appreciate, Shakespeare. He was much struck by English manners, was deeply persuaded by English liberal republican republican and eccentricity, and gained some thousands of pounds from an authorized English edition of the Henriade, dedicated to the queen. But he visited Paris now and then without permission, and his mind, like the mind of every exiled Frenchman, was always set thereon. He gained full licence to return in the spring of 1729.

He was full of literary projects, and immediately after his return he is said to have increased his fortune immensely by a lucky lottery speculation. The Henriade was at last licensed in France. Brusius, a play which he had written, was accepted for performance, but kept back for a time by the author; and he began the celebrated poem of the Pucelle, the amusement and the torment of great part of his life. But he had great difficulties with two of his chief works which were ready to appear, Charles XII. and the Lettres sur les Anglais. With both he took all imaginable pains to avoid offending the censorship; for Voltaire had, more than any other man who ever lived, the ability and the willingness to stoop to conquer. At the end of 1730 Brusis indeed actually got acted. Then in the spring of the next year he went to Rouen to get Charles XII. and some other poems printed, which he accomplished. In 1732 another tragedy, Eriphone, appeared, with the same kind of halting success which had distinguished the appearance of its elder sisters since Iphigene. But at last, on the 13th of August 1732, he produced Zaore, the best (with Mepope) of all his plays, and one of the ten or twelve best plays of the whole French classical school. Its motive was borrowed to some extent from Othello, but that matters little. In the following winter the death of the comtesse de Fontaine-Martel, whose guest he had been, turned him out of a comfortable abode. He then took lodgings with an agent of his, one Demoulins, in an out-of-the-way part of Paris, and was, for some time at least, as much occupied with contracts, speculation and all sorts of means of gaining money as with literature. In the middle of this period, however, in 1733, two important books, the Lettres philosophiques sur les Anglois and the Temple du goët. Both were likely to make bad blood, for the latter was, under the mask of easy verse, a satire on contemporary French literature, especially on J. B. Rousseau, and the former was, in the guise of a criticism or rather panegyric of English ways, an attack on everything established in the church and state of France. It was published with certain "remarks" on Pascal, more offensive to orthodoxy than itself, and no mercy was shown to it. The book was condemned (June 10th, 1734), the copies seized and burnt, a warrant issued against the author and his dwelling searched. He himself was safe in the independent duchy of Lorraine with Emilie de Breteuil, marquise du Châtelet, with whom he began to be intimate in 1733; he had now taken up his abode with her at the château de Cirey.

If the English visit may be regarded as having finished
VOLTAIRE

201

Voltaire's education, the Cirey residence may be justly said to be the first stage of his literary manhood. He had written important and characteristic work before; but he had always been in a kind of literary Wanderjahre. He now obtained a settled home for many years, and, taught by his numerous brushes with the authorities, he began and successfully carried out that system of keeping out of personal harm's way, and of at once denying any awkward responsibility, which made him for nearly half a century at once the chief and the most prosperous of European heretics in regard to all established ideas. It was not till the summer of 1734 that Cirey, a half-dismantled country house on the borders of Champagne and Lorraine, was fitted for his residence. Richelieu's quarters of himself, of his hostess, and now and then of her accommodating husband. Many pictures of the life here, some of them not a little malicious, survive. It was not entirely a bed of roses, for the "respectable Emily's" temper was violent, and after a time she sought lovers who were not so much des écrubusques as Voltaire. But it provided him with a safe and comfortable retreat, and with every opportunity for literary work. In March 1735 the ban was formally taken off him, and he was at liberty to return to Paris, a liberty of which he made good use by polishing off his "Essai sur les moeurs" and the "Sûlè de Louis XIV." composed. He also returned, not too well-advisedly, to the business of courtiership, which he had given up since the death of the regent. He was much employed, owing to the incident, in the fêtes of the dauphin's marriage, and was rewarded through the influence of Madame de Pompadour on New Year's Day 1745 by the appointment to the post of historiographer-royal, once jointly held by Racine and Boileau. The situation itself and its accompanying privileges were what Voltaire chiefly aimed at, but there was a salary of two thousand livres attached, and he had the year before come in for three times as much by the death of his brother. In the same year he wrote a poem on Fontenoy, he received medals from the pope and dedicated "Mahomet" to him, and wrote court divertissements and other things to admiration. He was not only a courtier, he was a courtier with the best of the known of Voltairiana is the contempt or at least silence with which Louis XV.--a sensualist but no fool--received the maladroit and almost insolent inquiry "Trojan est-il content?" addressed in his hearing to Richelieu at the close of a piece in which the emperor had appeared with a transparent reference to the king. All this asentation had at least one effect. He, who had been for years admittedly the first writer in France, had been repeatedly passed over in elections to the Academy. He was at last elected in the spring of 1746, and received on the 14th of May. The tide began to turn. His name at court had naturally exasperated his enemies; it had not secured him any real friends, and even a gentlemanship of the chamber was no solid benefit, except from the money point of view. He did not indeed hold it very long, but was permitted to sell it for a large sum, retaining the rank and privileges. He had various proofs of the instability of his hold on the king during 1747 and in 1748. He once lay in hiding for two months with the duchesse de Maine at Sceaux, where were produced the comedietta of "La Prude" and the tragedy of "Rome sourte" and, afterwards for a time lived churlily at Lunéville; here Madame de Chatelet had established herself at the court of King Stanislaus, and carried on a liaison with Saint-Lambert, an officer in the king's guard. In September 1749 she died after the birth of a child.

The death of Madame du Chatelet is another turning-point in the history of Voltaire. He was fifty-five, but he had nearly thirty years more to live, and he had learnt much during what may be called his Cirey cohabitation. For some time, however, after Madame du Chatelet's death he was in a state of pitiable unsetlement. At first, after removing his goods from Cirey, he hired the greater part of the Châtelet town house, and then the whole. He had some idea of settling down in Paris, and might perhaps have done so if mischief had not been the very breath of his nostrils. He went on writing satiric tales like "Zadig." He engaged in a foolish and undignified struggle with Crébillon tère (not filé), a rival set up against him by Madame de Pompadour, but a dramatist who, in part of one play, "Rhodamiste et Zénobie," has struck a note of tragedy in the grand Cornelian strain, which Voltaire could never hope to echo. "Semiramis" (1748), "Oreste" (1750) and "Rome sourte" itself were all produced by an unsuccessful courtier, and the public, if he used the most extraordinary efforts to make himself more popular than he was, but he could not help being uncomfortable.

All this time Frederick of Prussia had been continuing his invitations. Voltaire left Paris on the 15th of June 1751, and reached Berlin on the 10th of July. This Berlin visit is more or less familiar to English readers from the two great essays of Macaulay and Carlyle as well as from the Frederick of the
latter. But these two masters of English were not perhaps the best qualified to relate the story. Both were unjust to Voltaire, and Macaulay was unjust to Frederick as well. It is lucky that the king so behaved together like a king to his guest. He pressed him to remain; he gave him (the words are Voltaire's own) one of his orders, twenty thousand francs a year, and four thousand additional for his niece, Madame Denis, in case she would come and keep house for her uncle. But Voltaire's conduct was from the first Voltairean. He insisted on the consent of his own king, which was given without delay. But Frenchmen, always touchy on such a point, regarded Voltaire as something of a deserter; and it was not long before he bitterly repented his desertion, though his residence in Prussia lasted nearly three years. It was quite impossible that Voltaire and Frederick should get on together for long. Voltaire was not humble enough to be a mere butt, as many of Frederick's led poets were; he was not enough of a gentleman to hold his own place with dignity and discretion; he was constantly jealous both of his equals in age and reputation, such as Maupertuis, and of his juniors and inferiors, such as Buculard d'Arnaud. He was greedy, restless, and in a way Bohemian. Frederick, though his love of teasing for teasing's sake has been exaggerated by Macaulay, was a martinet of the first water, keenly though one-sidedly. He had not the slightest intention of allowing Voltaire to insult or to tyrannize over his other guests and servants. If he is to be blamed in this particular matter, the blame must be chiefly confined to his imprudence in inviting Voltaire at the beginning and to the brutality of his conduct at the end. Within Voltaire there was always a mischievous and ill-behaved child; and he was never more mischievous, more ill-behaved and more childish than in these years. He tried to get d'Arnaud exiled, and succeeded. He got into a quite unnecessary quarrel with Lessing. He had not been in the Netherlands before he engaged in a spectacular piece of financial gambling with Hirsch, the Dresden Jew. He was accused of something like downright forgery—that is to say, of altering a paper signed by Hirsch after he had signed it. The king's disgust at this affair (which came to an open scandal before the tribunals) was so great that he was on the point of ordering Voltaire out of Prussia, and Darget the secretary had no small trouble in arranging the matter (February 1753). Then it was Voltaire's turn to be disgusted with an occupation he had undertaken himself—occupations! "A king and a Frederick the Great! Have you succeeded in finishing and printing the Salle de Louis XIV., while the Dictionnaire philosophique is said to have been devised and begun at Potsdam? But Voltaire's restless temper was brewing up for another storm. In the early autumn of 1751 La Mettrie, one of the king's parasites, and a man of much more talent than is generally allowed, hurried Voltaire by telling him that Frederick had in conversation applied to him (Voltaire) a proverb about "sucking the orange and flinging away its skin," and about the same time the dispute with Maupertuis, which had more than anything else to do with his exclusion from Prussia, came to a head. Maupertuis got into a dispute with one König. The king took his president's part; Voltaire took König's. But Maupertuis must needs write his Letters, and thereupon (1752) appeared one of Voltaire's most famous, though perhaps not one of his most read works, the Diatribe du Docteur Akakia. Even Voltaire did not venture to publish this lampoon on a great official of a prince so touchy as the king of Prussia without some permission, and if all tales are true he obtained this by another piece of something or forgery—getting the king to endorse a totally different pamphlet on its last leaf, and affixing that last leaf to Akakia. Of this Frederick was not aware; but he did get some wind of the Diatribe itself, sent for the author, heard it read to his own great amusement, and either actually burned the MS. or believed that it was burnt. In a few days printed copies appeared. Frederick did not like disobedience, but he still less liked being made a fool of, and he put Voltaire under arrest. But again the affair blew over, the king believing that the edition of Akakia confiscated in Prussia was the only one. Alas! Voltaire had sent copies away; others had been printed abroad; and the thing was irrecoverable. It could not be proved that he had ordered the printing, and all Frederick could do was to have the pamphlet burnt by the hangman. Things were now drawing to a crisis. One day Voltaire sent his orders, &c., back; the next Frederick returned them, but Voltaire had quite made up his mind to fly. A kind of reconciliation occurred in March, and after some days of good-fellowship Voltaire at last obtained the long-sought leave of absence and left Potsdam on the 26th of the month (1753). It was nearly three months afterwards that the famous, ludicrous and brutal arrest was made at Frankfort, on the persons of himself and his niece, who had met him meanwhile. They were given some faint excuse for Frederick's wrath. In the first place, the poet chose to linger at Leipzig. In the second place, in direct disregard of a promise given to Frederick, a supplement to Akakia appeared, more offensive than the main text. From Leipzig, after a month's stay, Voltaire moved to Gotha. Once more, on the 23th of May, he moved on to Frankfort. Frankfort, nominally a free city, but with a Prussian resident who did very much what he pleased, was not like Gotha and Leipzig. An excuse was provided in the fact that the poet had a copy of some unpublished poems of Frederick's, and as soon as Voltaire arrived hands were laid on him, at first with courtesy enough. The resident, Freytag, was not a very wise person (though he probably did not, as Voltaire would have it, spell "poesie" "poesie"); constant references to Frederick were necessary; and the affair was prolonged so that Madame Denis had time to join her uncle. At last Voltaire tried to steal away. He was followed, arrested, his niece seized separately, and sent to join him in custody; and the two, with the secretary Collini, were kept close prisoners at an inn called the Goat. This situation was at last put an end to by the city authorities, who probably felt that they were not playing a very creditable part. Voltaire left Frankfort on the 7th of July, travelled safely to Mainz, and thence to Mannheim, Strasbourg and Colmar. The last-named place he reached (after a leisurely journey and many honours at the little courts just mentioned) at the beginning of October, and here he proposed to stay the winter. finish his Annals of the Empire and look about him.

Voltaire's second stage was now over. Even now, however, in the sixtieth year, it required some more external pressure to induce him to make himself independent. He had been, in the first blush of his Frankfort disaster, refused, or at least not granted, permission even to enter France proper. At Colmar he was not safe, especially when in January 1754 a pirated edition of the Essai sur les mœurs, written long before, appeared. Permission to establish himself in France was now absolutely refused. Nor did an extremely offensive performance of Voltaire's—the solemn partaking of the Eucharist at Colmar after due confession—at all mollify his enemies. His exclusion from France, however, was chiefly metaphorical, and really meant exclusion from Paris and its neighbourhood. In the summer he went to Plombières, and after returning to Colmar for some time journeyed in the beginning of winter to Lyons, and thence in the middle of December to Geneva. Voltaire had no purpose of remaining in the city, and almost immediately bought a country house just outside the gates, to which he gave the name of Les Délides. He was here practically at the meeting-point of four distinct jurisdictions—Geneva, the canton Vaud, Sanciena and Franches, while other cantons were within easy reach; and he bought other houses dotted about these territories, so as never to be without a refuge close at hand in case of sudden storms. At Les Délides he set up a considerable establishment, which his great wealth made him able easily to afford. He kept open house for visitors; he had printers close at hand in Geneva; he fitted up a private theatre in which he could enjoy what was perhaps the greatest pleasure of his whole life—acting in a play of his
own, stage-managed by himself. His residence at Geneva brought him into correspondence (at first quite amicable) with the most famous of her citizens, J. J. Rousseau. His *Orphée de la Chine*, performed at Paris in 1755, was very well received; the notorious *La Pucelle* appeared in the same year. The earthquake at Lisbon, which appalled other people, gave Voltaire an excellent opportunity for ridiculing the beliefs of the orthodox, first in verse (1756) and later in the (from a literary point of view) unsurpassable tale of *Candide* (1759). All was, however, not yet quite smooth with him. Voltaire had a law expressly forbidding theatrical performances in any circumstances whatever. Voltaire had infringed this law already, and the stage was being considered as a very suitable way Voltaire might establish himself and think of building a regular theatre, not indeed at Geneva but at Lausanne. In July 1755 a very polite and, as far as Voltaire was concerned, indirect resolution of the Consistory declared that in consequence of these proceedings of the Sieur de Voltaire the pastors should notify their flocks to abstain, and that the chief syndic should be informed of the Consistory's perfect confidence that the edicts would be carried out. Voltaire obeyed this hint as far as Les Délèces was concerned, and consoled himself by having the performances in his Lausanne house. But he never was the man to take opportunities of the kind without some meditations. He undoubtedly instigated D'Alembert to include a censure of the prohibition in his *Encyclopédie* article on "Geneva," a proceeding which provoked Rousseau's celebrated *Lettre à D'Alembert sur les spéciales*. As for himself, he looked about for a place where he could combine the social liberty of France with the political liberty of Geneva, and he found one.

At the end of 1758 he bought the considerable property of Ferney, on the shore of the lake, about four miles from Geneva, and on French soil. At Les Délèces (which he sold in 1759) he had been a householder no small settlement; and the purchase of Ferney (which he increased by other purchases and leases) he became a complete country gentleman, and was henceforward known to all Europe as sire of Ferney. Many of the most celebrated men of Europe visited him here, and large parts of his usual biographies are composed of extracts from their accounts of Ferney. His new occupations by no means quenched his literary activity. He did not make himself a slave to his visitors, but reserved much time for work and for his immense correspondence, which had for a long time once more included Frequent and enthusiastic, getting on very well when they were not in contact. Above all, he now, being comparatively secure in position, engaged much more strongly in public controversies, and resorted less to his old labyrinthine tricks of disavowal, garbled publication and private libel. The suppression of the *Encyclopédie*, to which he had been a considerable contributor, and whose conductors were his intimate friends, drew from him a shower of lampoons directed now at "l'infini" (see infra) generally, now at literary victims, such as Le Franc de Pompignan (who had written one piece of verse so much better than anything serious of Voltaire's that he could not be forgiven), or Paissot (who in his play *Les Philosophes* had boldly gibbetted most of the persons so termed, but had not included Voltaire), now at Fréron, an excellent critic and a dangerous writer, who had attacked Voltaire from the conservative side, and at whom the patriarch of Ferney, as he now began to be called, levelled in return the very inferior farce-lampoon of *L'Écosaise*, of the first night of which Fréron himself did an admirably humorous criticism.

How he built a church and got into trouble in so doing at Ferney, by the pet phrase "Deo erexit Voltaire" on it (1760-61) and obtained a relic from his work for his new building, how he entertained a grand-niece of Cornelle, and for her benefit wrote his well-known "commentary" on that poet, are matters of interest, but to be passed over briefly. Here, too, he began that series of interferences on behalf of the oppressed and the ill-treated which, whatever mixture of motives may have prompted it, is an honour to his memory. Volumes and almost libraries have been written on the Calas affair, and we can but refer here to the only less famous cases of Sirven (very similar to that of Calas, though no judicial murder was actually committed), Espinasse (who had been sentenced to the galleys for harbouring a Protestant minister), Lally (the son of the unjustly treated but not blameless Irish-French commander in India), D'Etalonde (the companion of La Barre), Montbaillii and others. In 1768 he entered into controversy with the bishop of the diocese; he had differences with the superior landlord of part of his estate, the president *De Brosses*, and he engaged in a long and tedious return match with the republic of Geneva. But the general events of this Ferney life are somewhat of that happy kind which are no events. Voltaire may have been a little too easily appalled by whatever he established himself at Ferney, became a very old one almost without noticing it. The death of Louis XV. and the accession of Louis XVI. excited even in his aged breast the hope of re-entering Paris, but he did not at once receive any encouragement, despite the reforming ministry of Turgot. A much more solid gain to his happiness was the adoption, or practical adoption, in 1776 of Reine Philiberte de Varicourt, a young girl of noble but poor family, whom Voltaire rescued from the convent, installed in his house as an adopted daughter, and married to the marquis de Villette. Her pet name was "Belle et Bonne," and nobody had more to do with the happiness of the last years of the "patriarch" than she had. It is doubtful whether his last and fatal visit to Paris was due to his own wish or to the instigation of his niece, Madame Denis; but this lady—a woman of disagreeable temper, especially to her inferiors—appears to have been rather hardly treated by Voltaire's earlier, and sometimes by his later, biographers.

The suggestion which has been made that the success of Beaumarchais' piéce he has nothing impossible in it. At any rate he had, at the end of 1777 and the beginning of 1778, the most of his famous play *Le Misanthrope*, which was not only an immense success, but so far exceeded the limits of that spirit, that he was sent to prison. He was to have been able to attend a performance of it, which was to have been the last of his time, but was not able to be there and was set free. He was crowned with laurel in his box, amid the plaudits of the audience, and did not seem to be the worse for it. He even began or proceeded with another tragedy—*Agathoclée*—and attended several Academic meetings. But such proceedings in the case of a man of eighty-four were impossible. To keep himself up, he exceeded even his usual excess in coffee, and about the middle of May he became very ill. On the 30th of May the priests were once more sent for—to wit, his nephew, the abbé Mignot, the abbé Gaultier, who had cared for the former occasion, and the parish priest, the curé of St Sulpice. He was, however, in a state of half-insensibility, and petulantly motioned them away, dying in the course of the night. The legends about his death in a state of terror and despair are certainly false; but it must be regarded as singular and unfortunate that he, who had more than once gone out of his way to confer ostentatiously and with his tongue in his cheek, should have neglected or missed this last opportunity. The result was a difficulty as to burial, which was compromised by hurried interment at the abbey of Seillères in Champagne, anticipating the interdict of the bishop of the diocese by an hour or two. On the 15th of July 1791 the body was transferred to the Pantheon, but during the Hundred Days it was once more, it is said, disentombed, and stowed away in a piece of waste ground. His heart, taken from the body when it was embalmed, and given to Madame Denis and by her to Madame de Villette, was preserved in a silver case, and when it was proposed (in 1864) to restore it to
the other remains, the sarcophagus at Sainte Geneviève (the Pantheon) was opened and found to be empty.

In person Voltaire was not engaging, even as a young man. His smooth volatile manner is marked, among other things, by the very poor but well-known epigram attributed to Young, and identifying him at once with "Satan, Death and Sin." In old age he was a mere skeleton, with a long nose and eyes of preternatural brilliency peering out of his wig. He never seems to have been addicted to any manly sport, and took little exercise. He was sober enough (for his day and society) in eating and drinking generally; but drank coffee, as his contemporary, counterpart and enemy, Johnson, drank tea, in a hardened and inveterate manner. It may be presumed with some certainty that his attentions to women were for the most part platonic; indeed, both on the good, and the bad side of him, he was all brain. He appears to have had no great sense of natural beauty, in which point he resembled his generation (though one remarkable story is told of his being deeply affected by Alpine scenery); and, except in his passion for the stage, he does not seem to have cared much for any of the arts. Conversation and literature were, again as in Johnson's case, the sole gods of his idolatry. As for his moral character, the wholly intellectual cast of mind just referred to makes it difficult to judge that. His beliefs or absence of beliefs emancipated the mind from theorists and he held his opinions but for subject for those who maintain that a nice morality may exist independently of religion. He was good-natured when not crossed, generous to dependents who made themselves useful to him, and indefatigable in defending the cause of those who were oppressed by the systems with which he was at war. But he was inordinately vain, and totally unscrupulous in gaining money, in attacking an enemy, or in protecting himself when he was threatened with danger. His peculiar fashion of attacking the popular beliefs of his time has also failed to secure the approval of some who had very little sympathy with those beliefs. The only excuse made for the alternate cringing and insult, the alternate abuse and lying, which marked his course in this matter, has been the very weak plea that a man cannot fight with a system—a plea which is sufficiently answered by the retort that a great many men have so fought and have won. Voltaire's works, and especially his private letters, constantly contain the word "l'infâme" and the expression (in full or abbreviated) "écrase l'infâme." This has been misunderstood in many ways—the mistake going so far as in some cases to make it appear that Voltaire meant to disparage by this pejorative expression. No careful and competent student of his works has ever failed to correct this gross misapprehension. "l'infâme" is not God; it is not Christ; it is not Christianity; it is not even Catholicoism. Its briefest equivalent may be given as "persecuting and privileged orthodoxy" in general, and, more particularly, it is the particular system which Voltaire saw around him, of which he had felt the effects in his own exiles and the confiscations of his books, and of which he saw the still worse effects in the hideous sufferings of Calas and La Barre.

Vast and various as the work of Voltaire is, its vastness and variety meet in the presence of its nobility and clarity quality: The divisions of it have long been recognized, and may be treated regularly.

The first of these divisions is in order, not the least in bulk, and, though not the first in merit, inferior to none in the amount of congenial labour spent on it, is the theatre. Between fifty and sixty different pieces (including a few which exist only in fragments or sketches) are included in his writings, and they cover his literary life. "Vaste défense," whose com- power was undoubtedly far in excess of his tragic, should have written many tragedies of no small excellence in their way, but only one fair second-class comedy, Nantus. His other efforts in this latter direction are either slight and almost insignificant in scope, or, as in the case of the somewhat famous Ecossaise, deriving all their interest from being personal libels. His tragedies, on the other hand, are works of extraordinary merit and importance. Although Voltaire had neither the perfect versification of Racine nor the noble poetry of Corneille, he surpassed the latter certainly, and the former in the opinion of some not incompetent judges, in playing the difficult and artificial game of the French tragedy. Zenone is one of those who have adopted the moral, and Mérope, among those where this motive is excluded and lost in subordination, yield to no plays of their clasie in that same the, in stage effect and in uniform literary merit. The acknowledged first of his players are those who essay to win these prizes for a capable and successful dramatist, and he was determined to win these prizes. He therefore set all his wonderful energies to the task, and in the end to adopt a little even of that Romantic disobedience to the strict classical theory which he condoned, and no doubt sincerely, in Shakespeare.

As regards his poems proper, of which there are two long ones, the Henriade and the Thésée, both are, if not the best, a bare catalogue fills fourteen royal octavo columns, their value is very unequal. The Henriade has by universal consent been relegated to the position of a school reading book. Conceived and written in almost a year, it has very little of the Medium a very unsuitable vehicle—the Alexandre coupé (as rendered and rendered monotonous for dramatic purposes)—and animated rather by enthusiasm for. The subject not very real, standing thereof, it could not be an unsatisfactory performance. The Pucelle, if morally inferior, is from a literary point of view of far more value. It is desultory to a degree; it is a base libel on religion and history; it differs from its model Aristotel in being, not as Aristot is, a mixture of romance and burlesque, but a sometimes tedious tissue of burlesque pure and simple; and it is exposed to the objection—often and justly urged—that much of its fun depends on the fact that there is not enough in Christianity to make its jokes give pain to them and to make their disgust at such jokes piquant to others. Nevertheless, to the end of his life, Voltaire was to the public as much above the Pucelle as the Pucelle is above the Henriade. It is true that there is nothing, or hardly anything, that properly deserves the name of poetry in them—no passion, no sense of the beauty of nature, only a narrow 'criminal' life; but still, and philosophical optimism, L'Homme aux quarante-tous cent certain social and political views of the time, Zadig and others the received forms of moral and metaphysical orthodoxy, who some are mere lampoons in the Bible, the unfailing stock of Voltaire's But (as always happens in the case of literary work where the form exactly suits the author's genius) the purpose in all the best of them is not merely a satire, but an almost entirely independent for others that the peculiar quality of Voltaire—ironie style without exaggeration—appears. That he learned it partly from Saint Evremont, still more from Anthony Hamilton, partly even from the species of parody Le Sage, partly from the political and social租车s, and others the received forms of moral and metaphysical orthodoxy, who some are mere lampoons in the Bible, the unfailing stock of Voltaire's But (as always happens in the case of literary work where the form exactly suits the author's genius) the purpose in all the best of them is not merely a satire, but an almost entirely independent for others that the peculiar quality of Voltaire—ironie style without exaggeration—appears. That he learned it partly from Saint Evremont, still more from Anthony Hamilton, partly even from the species of parody Le Sage, partly from the political and social. If one especial peculiarity can be singled out, it is the extreme restraint and simplicity of the verbal treatment. There is never this force of skill and art in the making that he has said, elucidates or comments on his own jokes, guffaws over them or exaggerates their form. The famous "pour encourager les autres" (that the shooting of Byng did "encourage the others" very much is not to the point) is a typical example, and indeed the whole of Candide shows the style at its perfection.

The fourth division of Voltaire's work, the historical, is the bulkiest of all except his correspondence, and some parts of it are or have been among the most read works but it is far from being even among the best. The small treatises on Charles XII. and Peter the Great are indeed models of clear narrative and ingenious if somewhat dull and ordinary style, especially the curious account of Louis XIV. and Sibelle de Louis XV. (the latter inferior to the former but still valuable) contain a great miscellany of interesting matter, treated by a man of great acuteness and unsurpassed power of word, and who was able to attach much important private information. But in even these books defects are present, which appear much more strongly in the singular olla podrida entitled Essais sur les mœurs, in the Annales de l'empire and the Histoire philosophique. This absence of any comprehension of what has since been called the philosophy of history, the constant presence of gross prejudice, frequent inaccuracy of detail, and a certain lack of perspective, are the chief defects, except from the narrow standpoint of a half-pessimist and half self-satisfied philosophe of the 18th century.

His work in physics concerns us less than any other here; it is, however, not inconsiderable in bulk, and is said by experts to give proof of aptitude. To his own age Voltaire was pre-eminently a poet and philosopher; the unkindness of succeeding ages has sometimes questioned
VOLterra

whether he had any title to either name, and especially to the latter, is a question. His philosophical work, at least so called, is the curious medley entitled *Dictionnaire philosophique*, which is composed of articles contributed by him to the great *Encyclopédie* and of several minor philosophical works. In English, as he moved from one religious country to another, his personal foibles, and the whole being largely seasoned with that acute, rather supercilious, common-sense, but also commonplace, ethical, and social criticism which became so popular at that period, perhaps second only to the novels as showing the character, literary and personal, of Voltaire; and despite its form it is nearly as readable. The minor philosophical works of *Dictionnaire philosophique* is the brief essay *Définition de la meta physique* the author makes his grand effort, but scarcely succeeds in doing more than show that he had no real conception of what metaphysic is.

In general *criticism* and *miscellaneous* writing Voltaire is not inferior to himself in any of his other functions. Almost all his more substantive works, whether in verse or prose, are preceded by prefaces of one sort or another, which are models of pungent *causerie*; and in a vast variety of nonsensical pamphlets and writings he shows himself a perfect journalist. In literary criticism pure and simple his principal work is the *Commentaire philosophique* (1763). Here he needed to be at once as specific as possible, sometimes (as in his Life and notes of Molière) independently sometimes as part of his *Siciles*. Nowhere, perhaps, except when he is dealing with religion, are Voltaire's defects more than balanced by his merits. He has the sense of the history of language and literature, and more here than anywhere else he showed the extraordinarily limited and conventional spirit which accompanied the 18th century against limits and conventions in theological, ethical and political matters.

There remains only the huge division of his *correspondence*, which is constantly being augmented by fresh discoveries, and which, according to Georges Rosso, has never been fully or correctly printed, even in some of the parts longest known. In this great mass Voltaire's personality is of course best shown, and perhaps his literary qualities not worst. His immense energy and versatility, his absolute faith in himself, his almost unerring sense of the path to be chosen to fling the most ruthless sarcasm when he chose to be sarcastic, his utter unscrupulous business faculty, his more than rather unscrupulous sense of the public eye, his desire to escape home and enemies,—all these things appear throughout the whole mass of letters.

Most judgments of Voltaire have been unduly coloured by sympathy with or dislike of what may be briefly called his political side. When sympathy and dislike are both discarded or allowed for, he remains one of the most astonishing, if not exactly one of the most admirable, figures of letters. That he never, as Carlyle complains, gave utterance to one great thought is truly not true. That his character is not a Germanic charlatan rather than positive genius is also true. But that he was merely a mocker, which Carlyle and others have also said, is not strictly true either. In politics proper he seems indeed to have had few or no constructive ideas, and to have been entirely ignorant or quite reckless of the fact that his attacks were destroying a state of things for which as a whole he neither had nor apparently wished to have any substitute; but he was, probably, and sincerely, that his own attitude was not purely negative; but here also he seems to have failed altogether to distinguish between prudence and cutting down. Both here and elsewhere his great fault was an inordinate superficiality. But this superficiality was accompanied by such wonderful acuteness within a certain range, by such an absolutely unsurpassed literary aptitude and sense of style in all the lighter and some of the graver modes of literature, by such unerring energy and versatility in enterprise, that he has no parallel among ready writers anywhere. Not the most elaborate work of Voltaire is of much value for matter; but not the very slightest work of Voltaire is without value. In literary criticism and biography he was at once versatile and accomplished, he has no superior and scarcely a rival.

**BIBLIOGRAPHY.**—The bibliography of Voltaire is a very large subject. It is not the purpose of a discussion of a diplomatist of such erudition and judgment, Georges Bengesco, *Bibliographie de Voltaire* (4 vols., Paris, 1882–90). The best edition of the works is that by Louis Moland in 52 volumes (Paris, Garnier); the handsome edition issued in a fine royal octavo by Furne, and kept in print by the house of Didot. Of the earlier editions, though their bulk is an objection, several are indispensably important. The edition of 1736 at first noticed the full edition of Kehl, in which Voltaire himself, and later Beaumarchais, were concerned (70 vols., 1736–89); those of Dalibon and Baudourin, each in 97 volumes (from which 52 of the hundred volumes of *Voltaire* have been derived, from the edition of 1775); and the Lounsbury's (2 vols., 1785), also of the year 1775. Editions of separate or selected works are innumerable, and so are books upon Voltaire. There is no really good detailed life of him, with complete examina-

tion of his work, in any language, though the works containing materials for such are numerous (the first of importance being that of T. J. Du-Denier in 1797), and sometimes (especially in the case of M. Desnoyerestures, *Voltaire et la société française*, 1867 and others) has comprised a number of letters. The English edition of *G. S.*
82–80 B.C. As a result of its resistance Sulla carried a law for the confiscation of the land of those inhabitants of Volaterrae who had had the privileges of Roman citizenship. This, however, does not seem to have been carried out until Caesar as dictator divided some of the territory of Volaterrae among his veterans. Among its noble families the chief was that of the Caxaeae, who took their name from the river which runs close to Volaterrae and still retains the name Cecuia. Cicero defended one of its members in an extant speech. It is included by Flainy among the municipal towns of Etruria. In the 12th and 13th centuries it enjoyed free institutions, and in 1361 it fell under the power of Florence. It rebelled, but was retaken and pillaged in 1472. Persius the satirist and the painter Daniele da Volterra were both natives of the town. Several works of the latter are preserved there.

**VOLTMETER**

An instrument for measuring differences of electric potential (see **Electrostatics**) in terms of the unit called a volt. The volt (so called after A. Volta) is defined to be the difference of potential which exists between the terminals of a resistance of one ohm sends through it a continuous current of one ampere. A voltmeter is therefore one form of electrometer (q.v.), but the term is generally employed to describe the instrument which indicates on a scale, not merely in arbitrary units but directly in volts, the potential difference of its terminals. Voltmeters may be divided into two classes, (a) electrostatic, (b) electrokinetic.

Electrostatic voltmeters are based on the principle that when two conductors are at different potentials they attract one another with a force which varies as the square of the potential difference (P. D.) between them. This mechanical stress may be made the measure of the P. D. between them, if one of the conductors is fixed while the other is movable, this last being subject to a constraint due to a spring or to gravity, means being also provided for measuring either the displacement of the movable conductor against the constraint or the force required to hold it in a fixed position relative to the fixed conductor. One large class of electrostatic voltmeters consists of a fixed metal plate or plates and a movable plate or plates, the two sets of plates forming a condenser (see **Leiden Jar**). The movable system is suspended or pivoted, and when a P. D. is created between the fixed and movable plates, the latter are drawn into a new position which is resisted by the torque of a wire or by the force due to a weight. Utilizing this principle many inventors have devised forms of electrostatic voltmeter. One of the best known of these is Lord Kelvin’s multicellular voltmeter. In this instrument (fig. 1) there are two sets of fixed metal plates, connected to the other member of the circuit, and a difference of potential is created between them, then the movable needle is drawn in so as to balance the measured voltage more included between the fixed plates. This movement is resisted by the torsional elasticity of the suspending wire, and hence a fixed indicating needle attached to the movable plate is caused to indicate directly on a scale the difference of potential between the terminals of the instrument in volts. Instruments of this kind have been constructed not only by Lord Kelvin, but also by W. E. Ayrton and others, for measuring voltages from 1000 to 10,000 volts.

Other types of electrostatic instruments the movable system rotates a horizontal axis or rests upon knife edges like a scale beam; in others the movable system is suspended by a wire. In the former case the control is generally due to gravity, the plates being so balanced on the knife edge that they tend to take up a certain fixed position from which they are constrained when the electric force tends to move them into another displacement relatively to the fixed plates being shown on a scale and thus indicating the P. D. between them. In the case of high tension voltmeters, the movable plate takes the form of a single plate of paddle shape, and for extra high tensions it may simply be suspended from the end of a balanced arm; or the movable system may take the form of a cylinder which is suspended within, but not touching, another fixed cylinder, the position being such that the electric forces draw the suspended cylinder more into the fixed one. Electrostatic voltmeters are now almost entirely used for the measurement of high voltages, from 2000 to 50,000 volts employed in electrotechnics. For lower voltages, however, those that are always under 1000 volts, whether in a metal case, the indicating needle moving over a divided scale which is calibrated to show directly the potential difference in volts of the terminals of the instrument. One much-used electrostatic voltmeter of this type is the Kelvin multimeter electrometer voltmeter (fig. 2). For use at the switch-boards of electric supply stations the instrument takes another form known as the “edge-wise” pattern.

Another class of voltmeters comprises the **electrokinetic voltmeter**. In these instruments the potential difference between two points is measured by the electrokinetic current produced by making the two points of the wire connecting to two points. In any case of potential difference measurement it is essential not to disturb the potential difference being measured; hence it follows that in electrokinetic voltmeters the wire connecting to two points of which the potential difference is to be measured must be of very high resistance. The instrument, therefore, may simply become an ammeter of high resistance, and may take any of the forms of practically used ammeters (see **Ampermeter**). Electromagnetic voltmeters may therefore be thermal, electromagnetic or electrodynamic.

As a rule, electromagnetic voltmeters are only suitable for the measurement of relatively small potentials—0 to 200 or 300 volts. Numerous forms of hot-wire or thermal voltmeter have been devised. In that known as the Cardew voltmeter, a fine platinum-silver wire, having a resistance of about 300 ohms, is stretched in a tube or upon a frame retained in a tube. This frame or tube is so constructed of iron and brass (one-third iron and two-thirds brass) that its temperature coefficient of linear expansion is the same as that of the platinum-silver alloy. The fine wire is fixed to one end of the tube or frame by an insulated support and the other end is attached to a motion-multiplying gearing. As the frame has the same linear expansion as the wire, external changes of the temperature will not affect their relative length, but if the whole wire is heated by the passage of an electric current, its expansion will move the indicating needle over the scale, the motion being multiplied by the gear. In the Hartmann and Braun form of hot-wire voltmeter, the fine wire is fixed between two supports and the expansion produced when a current is passed through it causes the wire to sag down, the sag being multiplied by a gear and made to move an indicating needle over a scale. In this case, the actual working wire, being short, must be placed in series with an additional high resistance. Hot wire voltmeters, like electrostatic voltmeters, are suitable for use with alternating currents of any frequency as well as with continuous currents, since voltages are measured in opposition of phases. Voltmeters consist of a conducting channel connecting to the terminals of the instrument, and extended the current produced in that wire by a difference of potential between the terminals creates a magnetic field proportional at any point to the strength of the current. This magnetic field may be made to cause a displacement...
in a small piece of soft iron, as in the case of the corresponding ammeters, and this in turn may be made to displace an indicating needle over a scale so that corresponding to every given potential difference between the terminals of the instrument there is a corresponding fixed position of the needle. The instrument takes the form of an electromagnetic voltmeter that is generally known as a *movable coil voltmeter* (fig. 3). In this instrument there is a fixed permanent magnet, producing a magnetic field in the in the interspace between the poles is fixed a delicately pivoted coil of wire carried in jewel bearings. The neutral position of this coil is with its plane parallel to the lines of force of the field. The current produces the temperature of the movable coil by means of fine flexible wires. The movable coil has attached to it an index needle moving over a scale, and a fixed coil of high-resistance wire is included in series with the movable coil between the terminals of the instrument. When a difference of potential is made between the terminals, a current passes through the coil, and the needle is also driven over a scale to place itself with its plane more or less at right angles to the lines of force resembling the hair of a spring. With this arrangement there is also a capacity to place the coil at any point on the scale corresponding to each potential difference between the terminals, provided it is within the limits of the scale. The instrument is only adapted for the measurement of continuous potential difference, that is to say, unidirectional potential difference, but not for alternating voltages. Like the corresponding ammeters, they have the great advantage that the scales are most divisional and that there is no dead part in the scale, whereas both the electrostatic and electrothermal voltmeters, described above, labour under the disadvantage that the scales of divisions are too large, but there is also a rise of voltages, here concretely, is generally a portion of the scale near the zero point where the divisions are so close as to be useless for reading purposes and are therefore omitted. For the measurement of continuous voltages, movable coil voltmeters are much employed, generally constructed then in the "edgewise" pattern (fig. 4).

**Electrodynamic Voltmeters.**—A high-resistance electrodynamic meter may be employed as a voltmeter if both the fixed and movable circuits consist of fine wires, and the instrument is constructed and used in a manner similar to the Siemens potentiometer for measuring continuous alternating current (see below). Another method used for measuring continuous current or unidirectional potential difference employs the principle of potentiometer (p.e.). In this case a high-resistance wire is connected between the points of which the potential difference is required, and from some known fraction of this resistance wire are brought to an electrostatic voltmeter, or to a movable coil electrometer voltmeter, according as the voltage to be measured is alternating or continuous. This measurement is applicable to the measurement of high potentials, either alternating or continuous, provided that in the case of alternating currents the high resistances of the voltmeter are not increased and an electrostatic voltmeter is used. The high-resistance wire should, moreover, be one having a negligible change of resistance with temperature. For this purpose it must be an alloy such as manganin or constantan. Consider, for instance, a hot-wire electrostatic voltmeter for measuring potential difference if it is necessary to keep the voltmeter permanently connected to the two points. Any form of electrodynamic voltmeter for measuring alternating current through the wire necessitates the expenditure of energy to maintain this current and therefore involves cost of production. This amount may not by any means be an insignificant quantity. Consider, for instance, a hot-wire electrometer voltmeter. If the wire has a resistance of 300 ohms and is connected to two points differing in potential by 100 volts, the instrument passes a current of one-third of an ampere, say 33 watts in power. Since there are 8760 hours in a year, if such an instrument were connected continuously to the circuit it would take up energy equal to 263,000 watt-hours, or 260 Board of Trade units per annum. If the cost of production of this energy was only one penny per unit, the working expenses of keeping such a voltmeter in connexion with a circuit would therefore be more than £1 per annum, representing a capitalized value of, say, £10. Electrostatic instruments, however, take up no power and hence cost nothing for maintenance other than wear and tear of the instrument. The instructions required in a good voltmeter are:—(i.) It should be quick in action, that is to say, the needle should come quickly to a position giving immediately the P.D. of the terminals of the instrument. (ii.) The instrument gives the corresponding position of the needle to the same P.D. whether this has been arrived at by increasing from a lower value or decreasing from a larger value; in other words, there should be no indication of hysteresis. (iii.) The instrument should have no temperature correction; this is a good point for electrostatic instruments, but in all voltmeters of the electrokinetic type which are wound with copper wire an increase of one degree centigrade produces a motion of the needle equal to one-thousandth of its total travel of 0.4°, and therefore to the same extent alters the correctness of the indications. (iv.) It should, if possible, be available both for alternating and continuous currents. (v.) It should be portable for use in the field, and for that good quality of external electric or magnetic fields. This last point is important in connexion with voltmeters used on the switchboards of electric power stations, where the fields may be present, due to strong currents passing through conductors near or on the board. It is therefore always necessary to check the readings of such an instrument in situ. Electrostatic voltmeters are also liable to have their indications disturbed by electrostatic fields of the glass cover of the instrument; this can be avoided by varnishing the glass with a semi-conducting varnish so as to prevent the location of electrostatic charges on the glass.

---

**VOLTURNO—VOLUINSKY**

(anc. *Voluteum*, from *volvere*, to roll), a river of central Italy, which rises in the neighbourhood of Alfedena in the central Apennines of Samnium, runs S. as far as Venafro, and then S.E. After a course of some 75 m. it receives, about 5 m. E. of Caiazzo, the Calore, only 3 m. less in length, which runs first N. and then W., and after 37 m. reaches Benevento, near which it receives several tributaries; then curves round the mountain mass to the N. of the Caudine Forks, and so beyond Telese joins the Volturno. The united stream now flows W.S.W. past Capua (anc. *Castrum*), where the river fields may be present, due to strong currents passing through conductors near or on the board. It is therefore always necessary to check the readings of such an instrument in situ. Electrostatic voltmeters are also liable to have their indications disturbed by electrostatic fields of the glass cover of the instrument; this can be avoided by varnishing the glass with a semi-conducting varnish so as to prevent the location of electrostatic charges on the glass.

---

**VOLUINSKY, ARTEMY PETROVICH** (1689-1749), Russian general and statesman, son of Peter Voluinsky, one of the dignitaries at the court of Theodore III, Emperor of an ancient family. He entered a dragon regiment in 1704 and rose to the rank of captain; then, exchanging the military service for diplomacy, he was attached to the suite of Vice-Chancellor Shafirov. He was present during the campaign of the Truth, shared Shafirov's captivity in the Seven Towers and in 1715 was sent by Peter the Great to Persia to promote Russian influence there, and it possible to find an outlet to India. In 1718 Peter made him one of his six adjutant-generals, and governor of Astrakhan. In this post Voluinsky displayed distinguished administrative and financial talents. In 1723 he married Alexandra Narushkina, Peter's cousin. The same
year he was accused of peculation and other offences to the emperor, who caned him severely and deprived him of his plenipotentiary powers, despite his undeniable services in Persia, but for which Peter could never have achieved so triumphant from the difficult Persian war of 1723–25. Catharine, despite the severe losses of her artillery and infantry units, has been also divided Short time, and he held the same post for two years (1728–30) under Peter II. But his incorruptible courage and unbridled temper so discredited the government that he was deprived of the post shortly after the accession of Anne. From 1730 to 1736 Voluinsky served in the army under Münich. In 1737 he was appointed the second Russian plenipotentiary at the abortive congress of Nemirov held for the conclusion of peace with the Porte. In 1736 he was introduced into the Russian cabinet by Biren as a counterpoise against Andrei Osterman. Voluinsky, however, now voluntarily himself strong enough to attempt to supersede Biren himself, and openly opposed the favourite in the Council of State in the debates as to the indemnty due to Poland for the violations of her territory during the war of the Polish Succession, Biren advising that a liberal indemnty should be given, whereas Voluinsky objected to any indemnty at all. Biren thereupon forced Anne to order an inquiry into Voluinsky's past career, with the result that he was tried before a tribunal of Biren's creatures and condemned to be broken on the wheel and then beheaded. On the scaffold, "by the clemency of the empress," his punishment was mitigated. Voluinsky was exiled to Siberia, his fortune confiscated, his estate burnt, and his property confiscated. The whole business seems to have been purely a piece of vindictiveness on the part of Biren.

**Volunteers**, a general term for soldiers who are not professionals nor permanently embodied under arms in peace. Although it would be difficult to say when the principle of volunteer organization for national defence was first adopted in England, it is certain that voluntary military societies existed in various parts of the country in the reign of Henry VIII., who in fact granted a charter in 1537 to the "Fraternity of Gylde of Saint George: Maisters and Rulers of the said Science of Artillary as aforesaid rehearsed for long-bowes Cros-bowes and Hand-Gomes." This ancient corps is now the Honourable Artillery Company of London. Although the Honourable Artillery Company has always been a distinct association, it was at one time (notably during the Great Rebellion) a centre of instruction for the City-trained hands, and in later times the H.A.C., divided itself into various city units when one time or another were training and obligations to the Volunteer or Territorial Forces. Charters of a similar kind were granted to a Colchester society in 1619 and to one at Bury St Edmunds in 1628. In the 16th and 17th centuries also various temporary corps outside the militia or trained-band organization were called volunteers. At Boston, Massachusetts, there is established a corps bearing the name of the "Antient and Honourable Company of Volunteers of the Massachusetts." This company was formed in 1638 after its London prototype, and at the head of a large organized Volunteer Force, however, seems to have originated in England at the time of the Militia Bill of 1757, which was amended in 1758 so as to allow the militia captains to accept volunteers instead of the ordinary militiamen who were compulsorily furnished *pro rata* by each parish. In 1778 the volunteers were still voluntary substitutes for the militia, though formed in separate companies of the militia unit, but volunteer corps soon began to form themselves independently of the militia. In the meantime a large volunteer force had sprung up in Ireland. In 1770, Ireland being threatened with foreign invasion, a levy of 20,000 Protestants was made by the government in the north. The 20,000 Protestants had gone in 1782 to 100,000 of all arms and both creeds, and they used their strength effectively for political purposes. After the establishment of the parliament at Dublin, and the general peace of 1783, attempts were made to use this army for party purposes, and

The moderate men in parliament therefore hastened to disband it. But this military coup d'etat was not forgotten in England. Ireland indeed supplied 70,000 volunteers during the Napoleonic wars, practically in place of her militia quota. But the rebellion of 1798 kept alive the memory of 1782, and about 1804 the government of the French press became more and more formidable. Volunteer corps, some dependent as companies upon the militia, others independent units, were raised in 1794, volunteer service counting as militia service for the purposes of raising the county, town or parish quota. This was followed in 1798 by the formation, for purely local defence, of the Armed Associations, the equivalent of the modern "rifle clubs." At the peace of Amiens the 340,000 on active service were nearly all disbanded, but one or two corps passed into the regular army as entire regiments, and some others managed to avoid disbandment and therefore the renewal of the war. The danger of invasion was then at its height, and in a few months the force numbered 380,000 men, or 3% of a population which already kept up a regular army and a militia. But the training of this mass was very unequal; the numbers fell off as the likelihood of invasion decreased, and in the reaction from the first enthusiasm it began to be questioned whether the volunteers could be of much value under the existing conditions of service prevailing. In 1803, therefore, the Local Militia was revived, in which terms of enlistment and training liabilities were both stricter and better defined. The greater part of the volunteers transferred themselves to the Local Militia, which by 1812 (aided by the ballot) had reached a strength of 215,000 as against the 70,000 of the remaining volunteers. With the general peace of 1814 all these forces except the H.A.C. and the Yeomanry (g.v.) disappeared.

After an interval of nearly half a century the warlike attitude of France caused British citizens once more to arm for the protection of their country. The British army and navy had declined in strength and efficiency; France, on the other hand, by the energetic development of her military and naval power and the early application of steam to ships of war, brought the possibilities of the invasion of England in 1856 within measurable distance. England at this time was awakened to the gravity of the situation by the publication of a letter from Wellington to Sir John Burgoyne, followed by a well-timed pamphlet by Sir Charles Napier, entitled *The Defence of England by Volunteer Corps and Militia*. The French danger, in abeyance during the Crimean War, was revived in 1857, when the threat of the French press became more and more menacing. The war in China, the Indian Mutiny and difficulties with the United States taxed the regular army to the utmost; while at home, besides the actual garrisons, there were barely 36,000 militia. This threatening condition of affairs tended to aggravate, if not to produce, a serious commercial panic. It was then that the volunteer movement began, and the Orsini episode and the openly expressed threats of French officers were all that was necessary to free the pent-up enthusiasm.

A few rifle clubs were already in existence, and two of these, which were formed to assist the military administration of 1853–54, were the two senior volunteer battalions—1st V.B. (now 4th Bn.) Devonshire Regt., and Victoria Rifles (now 9th Bn. London Regt.). But it was not until the situation became acute that the War Office took the step of raising the "Volunteer Force." A circular letter, dated 12th May 1859, from the secretary for war to the lords-lieutenant of counties in Great Britain authorized the formation of volunteer corps. The general enrolment took place at first under the old statute (44 Geo. III.). The main provisions of that act, however, were found inapplicable to the altered conditions under which invasion was now possible, and they failed also to provide for the maintenance of the volunteer force on a permanent footing in peace. A new act (Volunteer Act 1863) was therefore passed, the most important provision of which was that apprehended invasion should constitute a

---

1 See *Life and Letters of Field-Marshal Sir John Burgoyne*. 

sufficient reason for the sovereign to call out the volunteers, in lieu of the old condition which required the actual appearance of the enemy. The volunteers were, when called out, bound to serve in Great Britain until released by a proclamation declaring the occasion to have passed. This was modified in 1900 during the South African War, a new enactment allowing the authorities to call them out at any time of "military necessity, under danger and great emergencies". In 1871 the volunteers were removed from the control of the lords-lieutenant and placed under the War Office. In 1881 the infantry battalions were affiliated to the various line regiments.

The force thus brought into existence was composed of corps of light horse, mounted rifles, garrison and heavy artillery, engineers and rifle volunteers. Later there existed also in connexion with the admiralty a corps of "Royal Naval Artillery Volunteers" for the coast defences. The terms of service and training liabilities underwent no alteration of principle during the forty-eight years of the force's existence. The property belonging to the corps was vested in the commanding officer and administered by a committee of officers under the rules of the corps. These rules were in the first instance agreed on at a general meeting of officers and men, and, having received the queen's approval, became legal, and could be enforced. The commanding officer could dismiss a man from the corps, and a volunteer not on actual service could terminate his engagement at fourteen days' notice. But, as it became the almost universal practice for the government or the regimental commander to issue clothing and equipment freely, the volunteersshade in return for his services than to retain the ranks in anticipation of war, cared no longer to bear arms. Their places were taken by the artisan class, which added materially to the number and permanence of the force. But, as contributions and subscriptions now flagged, it became evident that public grants would have to be voted for its maintenance, and a scale of capitation allowances, subject to regulation, was fixed, on the recommendation of a Royal Commission. This capitation allowance per efficient volunteer was thenceforward the only item of all regimental finance and administration.

The turnpike, in the history of the volunteers was the South African War. In January 1900, and on several subsequent occasions, the volunteers were invited to supply service companies for South Africa, to be incorporated in the regular battalions to which the volunteer battalions were affiliated. About one-third of the whole force volunteered for service in South Africa, and some 20,000 served in the volunteer companies with the line and in the "City Imperial Volunteers", besides a great number of volunteers whom the higher pay, the light horse and mounted rifles disappeared in the end, or else were converted into yeomanry. The "rifle" title was retained even after the infantry had been assimilated in drill, uniform and other respects to the line battalions. For this reason even scarlet-covered battalions had no colours, pouch-belts instead of sashes, &c.

Strength of the Volunteer Force

VOLUSENUS, FLORENTIUS [Florence Wilson, or Wolsey, in later writers Wilson, though in letters in the vernacular he writes himself Volusenue (c. 1504-c. 1547), Scottish historian, was born near Elgin about 1504. He studied philosophy at Aberdeen, and in the dialogue De Animis Tranquillitati says that the description of the abode of tranquillity was based on a dream that came to him after a conversation with a fellow-student on the banks of his native Lossie. He was then a student of philosophy for four years' standing. Proceeding to Paris, he became tutor to Thomas Wynter, reputed son of Cardinal Wolsey. He paid repeated visits to England, where he was well received by the king, and, after Wolsey's fall, he acted as one of Cromwell's agents in Paris. He was in England as late as 1534, and appears to have been rector of Speldhurst in Kent. In Paris he knew George Buchanan, and found patrons in the cardinal, Jean de Lorraine and Jean du Bellay. He was to have gone with du Bellay on his mission to Italy in 1535, but illness kept him in Paris. As soon as he recovered he set out on his journey, but at Avignon, by the advice of his friend Antonio Bonvisi (d. 1538), he sought the patronage of the bishop of the diocese, the learned and pious Paul Sadolet, who made him master in the school at Carpentras, with a salary of seventy crowns. Volusenus paid frequent visits to Lyons (where Conrad Gesner saw him, still a young man, in 1542), probably also to Italy, where he had many friends, perhaps even to Spain. A letter addressed to him by Sadolet from Rome in 1546 shows that he had then resolved to return to Scotland, and had asked advice on the attitude he should adopt in the religious dissensions of the time. He died on the journey, however, at Vienne in Dauphiné, in 1546, or early in the next year.

Volusenus's linguistic studies embraced Hebrew as well as Greek and Latin. His reputation, however, rests on the beautiful dialogue De Animis Tranquillitati, the first printed by S. Gryphius at Lyons in 1543. From internal evidence it appears to have been composed about that time, but the subject had exercised the writer for many years. The dialogue shows us Christian humanism at its best. Volusenus is a great admirer of Erasmus, but he criticizes the purity of his Latin and also his philosophy. His own philosophy is Christian and Biblical rather than classical or scholastic. He takes a fresh and independent view of Christian ethics, and he ultimately reaches a doctrine as to the witness of the Spirit and the
assurance of grace which breaks with the traditional Christianity of his time and is based on ethical motives akin to those of the German Reformers. The verses which occur in the dialogue, and the poetical context under which it is given, VOLVOLUMINA (Vulcanus) and Vulcans, but it is as a Christian philosopher that he attains distinction.

The dialogue was reissued at Leiden in 1637 by the Scots writer David Eclint, whose poems, with a selection of three poets, from the dialogue of Volvulusa, appear, with others, in the famous Dutch collection Deliaetae Poetarum Societatem hujus aevi, printed by Baev in 2 vols. in 1637. Later editions of the dialogue appeared by Edmundson (1879), the 70th ed. (D. G. Wishart). All the reissues contain a short life of the author by Thomas Wilson, advocate, son-in-law and biographer of Archibald Patrick Adamson. Supplemental facts are found in the entries under the poet, and in Sadleir's Letters.

VOLUTE (Lat. volutum, volvere, to roll up), in architecture, the spiral scroll of the capital of the Ionic order. As in the earliest example known, that of the archaic temple of Diana at Ephesus, the width of the abacus is twice that of the depth, constituting therefore a bracket-capital; it is probable that at first it consisted of an oblong block of timber, which, raised on a vertical post or column, lessened the bearing of the architrave or beam, and the first volutes or scrolls were painted on. In votive columns carrying a sphinx, as at Delphi, or seated figures of women, such as are found at Hagia Sophia, at least two volutes were retained, but in the porticoes of the Greek temples the abacus was made square and the volute diminished in projection on each side. In the side elevation of the capital which joins the two volutes is known as the cushion, and when the Ionic column was used in porticoes in the capitals of the angle columns the volute was brought out on the diagonal, so as to present the same design on front and side; this, however, at the back led to a very awkward arrangement with two half volutes at right angles to one another, which was not of much importance under the portico, but when, in the open peristyle of the Pompeian house, it faced the open court, another design was necessary, and the angle volute was employed on all four sides. A similar arrangement was devised by Ictinus for the capitals of the interior of the temple at Bassae (430 B.C.), and was employed in the semidetached columns of the raised stage at Epidaurus. The Romans adopted the angle volute in the temple of Fortuna Virilis at Rome, but, except in their porticoes and as semidetached between arches, the Ionic order was rarely employed by them, and few Roman examples are known.

The architects of the Revival in the 18th century entirely misused this form, and meanly detached the volute from the inner fillet of which was always carried horizontally across the abacus in Greek and Roman work, and mistook them for horse, which they turned down into the echinus moulding.

VONDEL, JOOST VAN DEN (1587-1679), Dutch poet, was born at Cologne on the 17th of November 1587. His father, a hatter, was an exile from Antwerp on account of his Anabaptist opinions; but he returned to Holland when Joost was about ten years old, and settled in Amsterdam, where he carried on a hosier business. Joost was the eldest son, and was expected to succeed to his father's shop. He was early introduced to the chamber of the Eglatine, however, and devoted most of his time to poetry and study. When the elder Vondel died he married Maria de Wolf, and seems to have left the management of his affairs in her capable hands. He read the French contemporary poets, and was especially influenced by the Divine Heptaméron of Du Bartas; he made some translations from the German; he was soon introduced to the circle gathered in the house of Roemer Visscher, and with these friends began to make a close study of classical writers. His first play, Iet Pascha, was printed in 1612, and proved to be the beginning of a long and brilliant literary career (see DUTCH LITERATURE).

After the production of his political drama of Palamedes, or Murdered Innocence (1623), which expressed his indignation at the judicial murder of Olenenearneveldt in 1619, Vondel had to go into hiding, but the Amsterdam magistrates eventually satisfied themselves with an exorbitant fine. In the following years he issued a number of stinging satires against the extreme Calvinists, and he entered into close relationship with Hugo Grotius, another sufferer for his liberal opinions. Vondel had long been attracted by the aesthetic side of the Roman Catholic Church, and this inclination was perhaps strengthened by his friendship with Marie Tesseachersch Visscher, for the Visscher household had been Catholic and liberal. Tesserarcs's husband died in 1634; Vondel's wife died in 1635; and the ties between the two were strengthened by time. Vondel eventually showed his revolt against the Calvinist tyranny in formally embracing the Roman Catholic faith in 1625.

The step was not made by many of his friends, and Hooff forbade him the hospitality of his castle at Middlen. In 1657 his only surviving son, who was entrusted with the hospitable business, mismanaged affairs to such an extent that he had to take ship for the East Indies, leaving his father to face the creditors. Vondel had to sacrifice the whole of his small fortune, and became a government clerk. He was pensioned after ten years' service, and died on the 5th of February 1679.

The more important of his thirty-two dramas are: Hierusalem Restovert ("Jerusalem had desolate") (1620); Palamede, of Vermoorde onnooselheyt ("Palamedes, or Murdered Innocence") (1625); Gijstbrecht van Aensel (1637); De Gereeders (1640), the subject of which is the rule of the Louvre; De Staat der Heere Maria Stuart, of gemarcellte majestee (1646); the pastoral De Leerouwenders (1683); Lucifer (1654); Solomonus (Solomon) (1657); Echlin (1640); Koning David in ballingschap ("King David in exile") (1660); Koning David in ballingschap and Samson (1660); Batasche Gereeders, of the subject of which is the story of Claudius Civila (1663); Adam in ballingschap ("Adam in exile") (1664), after which he retired.

He also wrote translations from the tragedies of Seneca, Euripides, and Sophocles; didactic poems; and much lyrical poetry besides what is to be found in the choruses of his dramas.

His complete works were edited by van Lennep (12 vols., 1880-1886). A bibliography (1888) was published by J. H. W. Unger, who revised van Lennep's edition in 1888-94. Lucifer was translated by L. C. van Nappen (New York, 1896). See also E. Cosse, Studies in Northern Literature (1897); E. Edmundson, Milton and Vondel (1885), where Milton's supposed indebtedness to Vondel is discussed; and critical studies by A. Baumgarten, Des H. H. D. Vondels Leben und Werke (1893); J. Thimm (Portretten van Joost van den Vondel, 1876); and especially the chapters on Vondel (pp. 133-329) in W. J. A. Jonckhote's Geschiedenis der nederlandsche letterkunde (vol. iv. 1890).

VON HOLST, HERMANN EDUARD (1841-1904), German-African historian, was born at Pella in the province of Luvonia, on the 19th of June 1841. He was educated at the universities of Dorpat and Heidelberg, receiving his doctor's degree from the latter in 1865. He emigrated to America in 1867, remaining there until 1872. He was professor of history in the newly reorganized university of Strassburg from 1872 to 1874, and at Freiburg in Baden from 1874 to 1892, and for ten years he was a member of the Baden Herrenhaus, and vice-president for four. He revisited the United States in 1878-79 and in 1884, and in 1892 he became head of the department of history at the university of Chicago. Retiring on account of ill-health in 1900, he returned to Germany and died at Freiburg on the 20th of January 1904. Both through his books and through his lectures at the university of Chicago, Von Holst exerted a powerful influence in encouraging American students to follow more closely the German methods of historical research. His principal work is his Constitutional and Political History of the United States (German ed., 5 vols., 1873-91; English trans. by Lator and Mason, 8 vols., 1877-92), which covers the period from 1783 to 1861, though more than half of it is devoted to the decade 1850-60; it is written from a strongly anti-slavery point of view. Among his other writings are: The Constitutional Law of the United States of America (German ed., 1885; English trans., 1887); John C. Calhoun (1882), in the American Statesmen Series; John Brown (1888), and The French Revolution Tested by Mirabeau's Career (1894).

See the Political Science Quarterly, v. 697-78; the Nation, lxxvii. 65-67.

VONNOH, ROBERT WILLIAM (1858- ), American portrait and landscape painter, was born in Hartford, Connecticut, on 10th of September 1858. He studied at the École des Beaux-Arts in Paris; became an instructor at the Cowles Art School, Boston (1884-85), at the Boston
VONONES—VORONEZH

211

VORONEZH, a government of southern Russia, bounded N. by the government of Tambov, E. by Saratov and the Don Cossacks, S. by Kharkov and W. by Kursk and Orel; area, 25,435 sq. m. It occupies the southern slopes of the middle-Russian plateau, and its average elevation is from 450 to 700 ft. The surface is hilly, and intersected by ravines in the west (where two ranges of chalk hills separated by a broad valley run north and south), but flat and low cast of the Don. Devonian sandstones crop out in the north: further south these are covered with Cretaceous deposits. Glacial valleys with erratic boulders extend as far south as Voronezh, and extensive areas are covered with Lacsunite clays and sands. The soil is very fertile, owing to the prevalence of black earth; it becomes, however, sandy towards the east.

VORONEZH—VORONTSOV

Voronezh lies on the border between the forest and meadow region of middle Russia and the southern steppes; the forests disappear rapidly towards the south, and those which in the time of Peter the Great stood on the upper tributaries of the Don, and were used for shipbuilding, have now been almost entirely destroyed. Less than one-tenth of the entire area is under wood.

The Don traverses Voronezh from N. to S.E., draining it for more than 400 m.; it is an important channel for the export of corn and other raw produce, as well as for the import of wood, floated down from the north. Its tributary, the Voronezh is also navigated, and the Bityug and Khoper, both left-hand affluents of the Don, flow in part through the government. Many other small streams flowing into the Don intersect the territory, but the influence of the dry steppes begins to make itself felt; there are no lakes, and marshes persist only in the valleys. The climate is continental, and although the mean temperature at the town of Voronezh is 4.2° F., that of January is as low as 8.5°, and that of July as high as 74.2°.

The estimated pop. in 1906 was 5,097,700. The inhabitants consist in nearly equal parts of Great Russians in the north and Little Russians in the south, but there are a few Poles, Germans and Jews, both Orthodox and Karaites. The government is divided into twelve districts, the chief towns of which are Voronezh, Biryuch, Bobrov, Boguchar, Korotoyak, Nizhnevodyetsk, Nove-Khopersk, Ostrogozhsk, Pavlovsk, Valuiky, Zadonsk and Zemlyansk. Agriculture is the chief occupation, and grain is exported to a considerable amount. The peasants own much land, the crown and the imperial domains 3% and private owners 36%.

The principal crops are rye, wheat, oats, barley and potatoes. Aniseed, sunflowers, tobacco and beetroot are extensively cultivated, and much attention is paid to the growth of the pineapple. There are large tracts of excellent pasture land, on which cattle are bred and herds of cart-horses and trotting-horses are found. There are nearly two hundred breeding establishments, those at Hrenovoye and Chesmenka being the most important. In many villages the inhabitants are engaged in the making of wooden wares. There are flour-mills, distilleries, oil, sugar and woolen mills, iron works and tobacco factories.

VORONEZH, a town of Russia, capital of the government of the same name, on the river Voronezh, 5 m. above its confluence with the Don and 367 m. by rail S.S.E. of Moscow. Pop. (1901) 54,146. It is one of the best-built and most picturesque provincial towns of Russia, and is situated on the steep bank of the river, surrounded by three large suburbs—Troitskaya, Yamskaya and Chizhovka. It has a military school of cadets, two museums, a monument (1860) to Peter the Great, a railway college, a pilgrimage church, and a theatre which figures in the history of the Russian stage. It was the birthplace of two peasant poets, who wrote some of the finest examples of Russian poetry—A. V. Kol'tsov (1809-1842) and I. S. Nikitin (1824-1861). A memorial to the former was erected in 1868. There are factories for cleansing wool and for the preparation of linens, woollens, hells, tallow and oil, as well as some distilleries. Voronezh is an important entrepôt for corn, flax, tallow, hides, sugar, wood and coal from the Don.

The city was founded in 1536, as a fort against Tatar raids, on a site which had been occupied from the 11th century by a Khazar town, but had been deserted during the 14th and 15th centuries. Four years afterwards it was burned by the Tatars, but again rebuilt, and soon became an important trading place. Peter the Great recognized its importance, and in 1695 built here a flotilla of boats for the conquest of Azov. The town was almost completely destroyed by fire in 1793, 1748 and 1773, but was always rebuilt.

VORONTSOV (or Voronzoff), the name of a Russian family, various members of which are distinguished in Russian history.

MIKHAIL ILARIKOVICH VORONTSOV (1714-1767), Russian imperial chancellor, was the first to become prominent. At the age of fourteen he was appointed a Kammer junker at the court of the cesarevna Elizabeth Petrovna, whom he materially assisted during the famous coup d'état of the 6th of December 1741, when she mounted the Russian throne on the shoulders of the Preobrazhensky Grenadiers. On the 3rd of January 1742 he married Anna Skavronskaya, the empress's cousin; and in 1744 was created a count and vice-chancellor. His jealousy of Alexis Bestuzhev induced him to participate in Lestocq's conspiracy against that statesman. The empress's affection for him (she owed much to his skillful pen and still more to the liberality of his rich kinsfolk) saved him from the fate of his accomplices, but he lived in a state of semi-eclipse during the domination of Bestuzhev (1744-1758). On the disgrace of Bestuzhev, Vorontsov was made imperial chancellor in his stead. Though well-meaning and perfectly honest, Vorontsov as a politician was singularly timorous and irresolute, and always took his cue from the court. Thus, under Elizabeth he was an avowed enemy of Prussia and a warm friend of Austria and France; yet he made no effort to prevent Peter III. from reversing the policy of his predecessor. Yet he did not lack personal courage, and endured torture after the Revolution of the 9th of July 1762 rather than betray his late sovereign. He generally refused to serve under her, though she reinstated him in the dignity of chancellor. When he found that the real control of foreign affairs was in the hands of Nikita Panin, he resigned his office (1763). Vorontsov was a generous protector of the nascent Russian literature, and, to judge from his letters, was a highly cultivated man.

ALEXANDER ROMANOVICH VORONTSOV (1741-1805), Russian imperial chancellor, nephew of the preceding and son of Count Roman Vorontsov, began his career at the age of fifteen in the Izmailovsky regiment of the Guards. In 1759, his kinsman, the grand chancellor Mikhail Illarionovich, sent him to Strasbourg, Paris and Madrid to train him in diplomacy. Under Peter III. he represented Russia for a short time at the court of St James's. Catherine II. created him a senator and president of the Board of Trade; but she never liked him, and ultimately (1791) compelled him to retire from public life. In 1802 Alexander I. summoned him back to office and appointed him imperial chancellor. This was the period of the triumph of the Vorontsovs, who had always insisted on the necessity of a close union with Austria and Great Britain, in opposition to Panin and his followers, who had leaned on France or Prussia till the outbreak of the Revolution made friendship with France impossible. Vorontsov was also an implacable opponent of Napoleon, whose "topsy-turvyness" he was never weary of denouncing. The rupture with Napoleon in 1803 is mainly attributable to him. He also took a leading part in the internal administration and was in favour of a thorough reform of the senate and the ministries. He retired in 1804. He possessed an extraordinary memory and a firm and wide grasp of history.

His "Memoirs of my Own times" (Rus.) is printed in vol. vii. of the Vorontsov Archives.

SEMEHN ROMANOVICH VORONTSOV (1744-1832), Russian diplomatist, brother of Alexander Romanovich, distinguished himself during the first Turkish War of Catherine II. at Larga and Kagula in 1770. In 1783 he was appointed Russian minister at Vienna, but in 1785 was transferred to London, where he lived for the rest of his life. Vorontsov enjoyed great influence and authority in Great Britain. Quickly acquainting himself with the genius of English institutions, their ways and methods, he was able to render important services to his country. Thus during Catherine's second Turkish War he contributed to bring about the disarmament of the auxiliary British fleet which had been fitted out to assist the Turks, and in 1793 obtained a renewal of the commercial treaty between Great Britain and Russia. Subsequently, his extreme advocacy of the exiled Bourbons, his sharp criticism of the Armed Neutrality of the North, which he considered disastrous to Russia and his denunciation of the partition of Poland as contrary to the first principles of equity and a shock to the conscience of western Europe, profoundly irritated
VÖRÖSMÁRTY—VORTIGERN 213

the empress. On the accession of Paul he was raised to the rank of ambassador extraordinary and minister plenipotentiary, and received immense estates in Finland. Neither Vorontsov's detention of the Russian squadron under Makarov in British ports nor his refusal, after the death of Bezborodko, to accept the dignity of imperial chancellor could alienate the favour of Paul. It was only when the emperor himself began to draw nearer to France that he began to consider Vorontsov as incompetent to serve Russia in England, and in February 1800 all the count's estates were confiscated. Alexander I. on his accession at once reinstated him, but ill-health and family affairs induced him to resign before he reached London; and that time, till the death in 1832, he continued to live in London.

Besides his valuable Note on the Russian War (Rus.) and numerous letters, Vorontsov was the author of an autobiography (in Russky Arkhiv, Petersburg, 1881) and "Notes on the Internal Government of Russia" (Rus.) (in Russky Arkhiv, 1881).

MIKHAIL SEMENOVICH VORONTSOV (1782-1836), Russian prince and field-marshall, son of the preceding, spent his childhood and youth with his father in London, where he received a brilliant education. During 1803-4 he served in the Caucasus under Tsinisianov and Gulyakov, and was mortally killed in the Zakatako disaster (January 15, 1804). From 1805 to 1807 he served in the Napoleonic wars, and was present at the battles of Pultusk and Friedland. From 1809 to 1811 he participated in the Turkish War and distinguished himself in nearly every important action. He was attached to Bagration's army during the war of 1812, was seriously wounded at Borodino, sufficiently recovering, however, to rejoin the army in 1813. In 1814, at Craonne, he brilliantly withstood Napoleon in person. He was the commander of the corps of occupation in France from 1815 to 1818. On the 9th of May 1823 he was appointed governor-general of New Russia, as the southern provinces of the empire were then called, which under his administration developed marvellously. He may be said to have been the creator of Odessa and the benefactor of the Crimea. He was the first to start steam-boats on the Black Sea (1828). The same year he succeeded the wounded Menshikov as commander of the forces besieging Varna, which he captured on the 28th of September. In the campaign of 1829 it was through his energetic efforts that the plague, which had broken out in Turkey, did not penetrate into Russia. In 1831 an edition of Vorontsov was appointed governor-in-chief and governor of the Caucasus with plenipotentiary powers. For his brilliant campaign against Shamyl, and especially for his difficult march through the dangerous forests of Ichkerinia, he was raised to the dignity of prince, with the title of Serene Highness. By 1838 he had captured two-thirds of Daghestan, and the situation of the Russians in the Caucasus, so long almost desperate, was steadily improving. In the beginning of 1853 Vorontsov was allowed to retire because of his increasing infirmities. He was made a field-marshall in 1856, and died the same year at Odessa. Statues have been erected to him both there and at Tiflis.

See V. V. Ogarkov, The Vorontsovs (Rus.) (Petersburg, 1892); Vorontsov Archives (Russ. and Fr.) (Moscow, 1870, &c.); M. P. Shelverbinin, Biography of Prince M. S. Vorontsov (Rus.) (Petersburg, 1858).

(R. N. B.)

VÖRÖSMÁRTY, MIHÁLY (1800-1853), Hungarian poet, was born at Pusztan-Nyék on the 1st of December 1800, of a noble Roman Catholic family. His father was a steward of the Nadasdys. Mihály was educated at Székesfehérvár by the Jesuits and at Pest by the Piarists. The death of the elder Vörösmarty in 1821 left his widow and numerous family extremely poor. As tutor to the Perczel family, however, Vörösmarty contrived to pay his own way and go through his aca
demical course at Pest. The doings of the diet of 1823 first enkindled his patriotism and gave a new direction to his poetical genius (he had already begun a drama entitled Salamon), and he flung himself the more recklessly into public life as he was consumed by a hopeless passion for Etelka Perczel, who socially was far above him. To his unrequited love we owe a whole host of exquisite lyrics, while his patriotism found expression in the heroic epos Zalán jutása (1824), gorgeous in colouring, exquisite in style, one of the gems of Magyar literature. This new epic marked a transition from the classical to the romantic school. Henceforth Vörösmarty was hailed by Kisfaludy and the Hungarian romanticists as one of themselves. All this time he was living from hand to mouth. He had forsaken the law for literature, but his contributions to newspapers and reviews were miserably paid. Between 1823 and 1831 he composed four dramas and eight shorter epics, partly historical, partly fanciful. Of these epics he always regarded Cserhalm as the best, and it was presented to the Pest Academy in return for Két szomszéd vir (1831), a terrible story of hatred and revenge. When the Hungarian Academy was finally established (November 17, 1830) he was elected a member of the philological section, and ultimately succeeded Karoly Kisfaludy as director with an annual pension of 500 florins. He was one of the founders of the Kisfaludy Society, and in 1837 started the Athenaeum and the Figyelőorvos, the first chief bellettiristic, the second the best critical periodical of Hungary. From 1830 to 1843 he devoted himself mainly to the drama, other his place of Vorontsov's collected works (1830) with the Academy's 100-golden-pistle prize. He also published several volumes of poetry, containing some of his best work. Század (1836), which became a national hymn, Az elhagyott anya (1837) and Az üröl hőgyéhs (1841) are all inspired by a burning patriotism. His marriage in 1843 to Laura Csajághy inspired him to compose a new cycle of erotics. In 1845, in conjunction with Arany and Petőfi, he set on foot an excellent translation of Shakespeare's works. He himself was responsible for Julius Caesar and King Lear. He represented Jankovics at the diet of 1848, and in 1849 was made one of the judges of the high court. The national catastrophe profoundly affected him. For a short time he was an exile, and when he returned to Hungary in 1850 he was already an old man. A profound melancholy crippled him for the rest of his life. In 1854 he wrote his last great poem, the touching A vén cígyh. He died at Pest in 1855 in the same house where Karoly Kisfaludy had died twenty-five years before. His funeral, on the 21st of November, was a day of national mourning. His penniless children were provided for by a national subscription collected by Ferencz Deák, who acted as their guardian.

In the allied genera Caschertium and Zoonanthium the two produced by fission remain united, so that a branching colony is ultimately produced. The genus is a large one, and many species are epizoic on various water animals.

VORTIGERN (Gruthiginus, Wyrtgern), king of the Britons at the time of the arrival of the Saxons under Hengest and Horsa. The records do not agree as to the date of the arrival of these chieftains or the motives which led them to come to Britain. It seems clear, however, that Vortigern
made use of them to protect his kingdom against the Picts and Scots, and rewarded them for their services with a grant of land. Later we find the Britons at war with the new-comers, now established in Kent, and four battles are fought, in the last of which, according to the Historia Brittonum, the king's son Vortemir, their leading opponent, is slain. The Historia Brittonum is our only authority for the marriage of Vortigern with the daughter of Hengest before the war. It also records the massacre of the British nobles after the death of Vortemir and the subsequent grant of Essex and Sussex to the invaders by Vortigern.

VOSGES, a frontier department of eastern France, formed in 1790 chiefly of territory previously belonging to Lorraine, together with portions of Franche-Comté and Champagne, and bounded N. by the department of Meurthe-et-Moselle, E. by Alsace, S.E. by the territory of Belfort, S. by the department of Haute-Saône, W. by Haute-Marne and N.W. by Meuse. Pop. 1906) 492,812; area, 2279 sq. m. The Vosges mountains (see below) form a natural boundary on the east, their highest French eminence, the Hohneck, attaining 4482 ft. The Monts Faucilles traverse the south of the department in a broad curve declining on the north into elevated plateaus, on the south encircling the upper basin of the Saône. This chain, dividing the basins of the Rhone and the Rhine, forms part of the European watershed between the basins of the Mediterranean and Atlantic. The Moselle and the Meuse, tributaries of the Rhine, have the largest drainage areas in the department; a small district in the N.W. sends its waters to the Seine, the rest belongs to the basin of the Rhone. The Moselle rises in the Col de Bussang in the extreme south-east, and in a N.W. course of about 70 m. in the department receives the Moselotte and the Vologne on the right; the Montagne and Meurthe on the right and the Madon on the left bank also belong to this department though they join the Moselle outside its borders. The source of the Saône is on the southern slope of the Faucilles. On the shore of Lake Gérardmer lies the beautifully situated town of Gérardmer, a well-known centre for mountain excursions.

The elevation and the northward exposure of the valleys make the climate severe, and a constant dampness prevails, owing both to the abundance of the rainfall and to the impermeability of the subsoil. The average temperature at Épinal (1070 ft.) is 49°F. The annual rainfall at Épinal is 28 in., at St Dié 32 in. and in the mountains more. Arable farming flourishing in the southern districts where wheat, oats and potatoes are largely grown. The vine is cultivated on the river banks, to best advantage on those of the Moselle. Pasture is abundant in the mountainous region, where cheese-making is carried on to some extent, but the best grazing is in the central valleys. Forests, which occupy large tracts on the flanks of the Vosges, cover about one-third of the department, and are a principal source of its wealth. Sawmills are numerous in the Vosges and the manufacture of furniture, sabot, brushes and wood-working in general are prominent industries. The department has mines of lignite and stone quarries of various kinds. There are numerous mineral springs, of which those of Contrexéville, Plombières, Vittel, Bains-les-Bains, Martigny-les-Bains and Plombières are the best. The manufacture of textiles is the chief industry, comprising the spinning and weaving of cotton, wool, silk, hemp and flax, and the manufacture of hosiery and of embroidery and lace, Mirecourt (pop. 5002) being an important centre for the two last. The department forms the diocese of St Dié (province of Besançon), it has its court of appeal and educational centre at Nancy, and belongs to the district of the XX. Army Corps. It is divided into the arrondissements of Épinal, Mirecourt, Neufchâteau, Remiremont and St Dié, which includes and contains.

VOSGES (Lat. Vosges or Vassag, Ger. Wassau or Vogezen), a mountain range of central Europe, stretching along the west side of the Rhine valley in a N.N.E. direction, from Basel to Mainz, for a distance of 150 m. Since 187 individuals, from the southern part, from the Ballon d’Alsace to Mont Donen, has been the frontier between France and Germany. There is a remarkable range of the Black Forest on the other side of the Rhine: both lie within the same degrees of latitude and have the same geological formation; both are characterized by fine forests on their lower slopes, above which are open pasturages and rounded summits of a uniform altitude; both have a steep fall to the Rhine and a gradual descent on the other side. The Vosges in their southern parts are composed of metamorphic, phyllitic rocks, mesetas, and porphyritic masses, and of a kind of red sandstone (occasionally 140 ft. in thickness) which on the western versant bears the name of "grets Vosgien."  

Geographically the range is divided south to north into four sections: the Grandes Vosges (62 m.), extending from Belfort to the valley of the Bruche; the Central Vosges (51 m.), between the Bruche and the Col de Saverne; the Lower Vosges (30 m.), between the Col de Saverne and the source of the Lauter; and the Hardt Vosges, the last named. The highest peak in the Grandes Vosges is called "ballons." The departments of Vosges and Haute-Saône are divided from Alsace and the territory of Belfort by the Ballon d’Alsace or St Maurice (4100 ft.). Thence northwards the average height of the district is 3000 ft., with an ascent of 300 ft. at the Col de Bussang (Gebweiler), or Soultz, rising to the east of the main chain to 4680 ft. The Col de Saeules, between the Grandes Vosges and the central section, is nearly 1900 ft. high; the latter is both lower and narrower than the other. The Great Vosges division reaches a second summit. The railway from Paris to Strassburg and the Rhine and Marine Canal traverse the Col de Saverne. No railway crosses the Vosges, though a line between Saverne and Belfort, but there are carriages over the passes of Bussang from Remiremont to Thann, the Schlucht (3766 ft.) from Gérardmer to Munster, the Bonhomme from St Dié to Colmar, and the pass from St Dié to Ste Marie-aux-Mines. The Grandes Vosges are a sandstone plateau ranging from 1000 to 1850 ft. high, and are crossed by the railway from Haguenau to Sarreguemines, defended by the fort of Bitche.

Meteorologically the difference between the eastern and western versants of the range, and the annual rainfall being much higher and the mean temperature being much lower in the latter than in the former. On the eastern slope the vine ripens to a height of 1300 ft.; on the other hand, its only rivers are the Ill and other shorter streams. The Moselle, Meurthe and Sarre all rise on the Lorraine side. Moraines, boulders and polished rocks testify the existence of the glaciers which formerly covered the Vosges. The lakes, surrounded by sires, benches and maples, the green meadows which provide pasture for large herds of cows, and the fine views of the Rhine valley, Black Forest and snow-covered Swiss mountains of the Jura in winter seem to make this district picturesque. On the eastern heights and buttresses of the main eminences of the Alsatian side are numerous castles, generally in ruins. At several points on the main ridge, especially at St Odile above Ribeauville (Rappoltsweiler), are curious buildings, called "forts," resembling, at a width of 6 to 7 ft. thick and 4 to 5 ft. high, called the paged wall (Mur Payen). It was used for defence in the middle ages, and archaeologists are divided as to whether it was built for this purpose by the Romans, or before their arrival.

VOSMAER, CAREL (1826-1888), Dutch poet and art-critic, was born at the Hague on the 26th of March 1826. He was trained to the law, and held various judicial posts, but in 1873 withdrew entirely from legal practice. His first volume of poems, 1860, did not contain much that was remarkable. His temperament was starved in the very thin air of the intellectual Holland of those days, and it was not until after the sensational appearance of Multatuli (Edward Douwes-Dekker) that Vosmaer, at the age of forty, woke up to a consciousness of his own talent. In 1860 he published a monograph on Rembrandt, which was issued in French. Vosmaer became a contributor to, and then the leading spirit and editor of, a journal which played an immense part in the awakening of Dutch literature; this was the Nederlandische Spectator, in which a great many of his own works, in prose and verse, originally appeared. The remarkable miscellanies of Vosmaer, called Birds of Diverse Plumage, appeared in three volumes, in 1872, 1874 and 1876. In 1879 he selected from these all the pieces in verse, and added other poems to them. They were published as a whole, and the story of the book was known as the Vosmaer, the scene of which was laid in Naples and Rome, and which described the raptures of a Dutch antiquary in love. Vosmaer
undertook the gigantic task of translating Homer into Dutch hexameters, and he lived just long enough to see this completed and revised. In 1873 he came to London to visit his lifelong friend, Sir (then Mr) Lawrence Alma-Tadema, and on his return published Londoniensis, an exceedingly brilliant mock-heroic poem in hexameters. His last poem was Nanno, an idyll on the Greek model. Vossmaer died, while travelling in Switzerland, on the 12th of June 1888. He was unique in his fine sense of plastic expression; he was eminently tasteful, lettered, refined. Without being a genius, he possessed immanence, talent, just as he had used his considerable writing the worn-out genre of Dutch poetry. His verse was modelled on Heine and still more on the Greeks; it is sober, without colour, stately and a little cold. He was a curious student in versification, and it is due to him that hexameters were introduced and the sonnet reintroduced into Holland. He was the first to repudiate the traditional, wooden alexandrine. In prose he was greatly influenced by Multatuli, in praise of whom he wrote an eloquent treatise, Een Eizer (A Soever). He was also somewhat under the influence of English prose models.

VOSS, JOHANN HEINRICH (1509-1579), German classical scholar and theologian, was born at Sommersdorf in Mecklenburg-Schlawitz on the 20th of February 1573, the son of a farmer. After attending (1566-69) the gymnasium at Neubrandenburg, he was obliged to accept a private tutorship in order to earn money to enable him to study at a university. At the invitation of H. C. Boie, whose attention he had attracted by poems contributed to the Göttingen Musenalmanach, he went to Göttingen in 1572. Here he studied philology and became one of the leading spirits in the famous Human or Dichterbund. In 1575 Boie made over to him the editorship of the Musenalmanach, which he continued to issue for several years. He married Boie's sister Ernestine in 1577 and in 1578 was appointed rector of the school at Otterndorf in Hanover. In 1578 he accepted the rectorship of the gymnasium at Eutin, where he remained until 1602. Retiring in this year with a pension of 600 thalers he settled at Jena, and in 1605, although Goethe used his utmost endeavours to persuade him to stay, accepted a call to a professorship at Heidelberg. Here, in the enjoyment of a considerable salary, he devoted himself entirely to his literary labours, translations and antiquarian research until his death on the 29th of March 1579.

Voss was a man of a remarkably independent and vigorous character. In 1789-95 he published in two volumes a collection of original poems, to which he afterwards made many additions. The best of these works is his idyllic poem Der Zauberbibe (1595). He afterwards, under the name of H. W. von der Wende, issued a series of more or less popular works, and applied the style and methods of classical poetry to the expression of modern German thought and sentiment. In his Mythologische Briefe (2 vols., 1794), in which he attacks the idea of Christian Godthob Hymnus, and in his Antiquitaten (2 vols., 1824-26), written in opposition to Georg Friedrich Creuzer (1771-1858), he in other writings he made important contributions to the study of mythology. He was also prominent as an advocate of the right of free judgment in religion, and at the time when some members of the Roman Catholic school were being converted to the Roman Catholic church he produced a strong impression by a powerful article, in Sophrinseum, on his friend, Johann von Stölberg's repudiation of Protestantism (1816). It is, however, as a translator that Voss chiefly owes his place in German literature. His translations include not only sound scholarship but a thorough mastery of the German language and rhythm. The most famous of his translations are those of Homer. Of these the best is the translation of the Odyssey, as originally issued in 1781. He also translated Hesiôd, Théocrite, Bion and Moschus, Virgîl, Horace, Tibullus, Propertius and other classical poets, and he prepared a critical edition of Tibullus. In 1818-29 was published, in 9 vols., a translation of Shakespeare's plays, which he completed with the help of his sons Heinrich and Abraham, both of whom were scholars and writers of considerable ability.

JOHANN HEINRICH Voss is mentioned in the following articles: Sämtliche poetische Werke published by his son Abraham in 1835; new ed. 1850. A good selection is in A. Suter, Der Vergleich der deutschen Literatur, vol. iv. (1867). His Letters were also published by his son in 4 vols. (1829-53). Voss left a short autobiography, Abriß meines Lebens (1816). See also W. Herbst, J. J. Voss (4 vols., 1872-76); A. von Schlabrendorff, J. H. Voss (1882).

VOSS, RICHARD (1851—). German dramatist and novelist, was born at Neugrape, in Pomerania, on the 2nd of September 1851, the son of a country squire. Though intended for the life of a country gentleman, he showed no inclination for outdoor life, and on his return from the war of 1870-71, in which he was wounded, he studied philosophy at Jena and Munich, and then settled at Berchtesgaden. In 1884 Voss was appointed by the grand duke of Weimar librarian of the Wartburg, but, in consequence of illness, he resigned the post.

Chief among his dramas are Sasanarks (1878); Mogda (1879); Die Patronetin (1880); Der Mahr der Zaren (1883); Ulrich Volk (1885); Alexandra (1888); Eva (1889); Wo die Besiegten (1899); Die neue Zeit (1891); Schuldig (1892). Among his novels may be mentioned San Sebastian (1883); Der Sohn der Valkenstein (1884); Der Monch von Berchtesgaden (1891); Der neue Gott (1898); Die Rächerin (1899); Alleher Erlebnen (1902); and Die Leute von Vorderen (1902).

VOTE

Commentarium Rhetoricon oratoriorum institutionum Libri VI. (1606 and often); De Historicis Gracis Libri III. (1624); De Historicis Latinis Libri III. (1627); De Theologia Gentilis (1642); Dissertationes Tres de Tribus Symbolis, Apotheosis, Apostolica, Augusti, Constantinopolitana (1642). Collected works published at Amsterdam (6 vols., 1695–1701).

VOTE and VOTING. The Latin votum, derived from voovere, to vow, meant a solemn promise, hence a wish, desire or prayer, in which sense the doublet "vow," derived through French, is used now chiefly. "Vote" is specially employed in the sense of a registering of one's choice in elections or on matters of debate, and the political meaning is the only one which requires comment.

Ancient.—In ancient Greece and Italy the institution of suffrage already existed in a rudimentary form at the outset of the historical period. In the primitive monarchies it was customary for the king to invite pronouncements of his folk on matters in which it was prudent to secure its assent beforehand. In these assemblies the people recorded their opinion by clapping (a method which survived in Sparta as late as the 4th century B.C.), or by the clashing of spears on shields. This latter practice may be inferred to have obtained originally in Rome, the word suffragium meaning literally a responsive crash. Owing to the lack of routine in the early monarchies and aristocracies of Greece and Italy the vote as yet lacked importance as an instrument of government. But in the days of their full political development the communities of these countries had firmly established the principle of government according to the will of majorities, and their constitutions required almost every important act to be directed by a formal vote. This rule applied equally to the decisions of general assemblies, administrative councils and law courts, and obtained alike in states where suffrage was universal and where it was restricted.

In every case the taking of votes was effected in the form of a poll. The practice of the Athenians, which is shown by inscriptions to have been widely followed in the other states of Greece, was to hold a show of hands (χειροποίησις), except on questions affecting the status of individuals: these latter, which included all lawsuits and proposals of ostracism (q.v.), were determined by secret ballot (ψῆφος ψηφοφορία, so called from the ψήφοι or pebbles with which the votes were cast). At Rome the method which prevailed up to the 2nd century B.C. was that of division (discessio). But the economic and social dependence of many voters on the nobility caused the system of open suffrage to be vitiated by intimidation and corruption. Hence a series of laws enacted between 252 B.C. and 107 B.C. provided for the use of the ballot ("tabella," a slip of wood coated with wax) for all business done in the assemblies of the people.

For the purpose of carrying resolutions a simple majority of votes was deemed sufficient. Regulations about a quorum seem to have been unusual, though a notable exception occurs in the case of motions for ostracism at Athens. As a general rule equal value was made to attach to each vote; but in the popular assemblies at Rome a system of voting by groups was in force until the middle of the 3rd century B.C. by which the richer classes secured a decisive preponderance (see PRINCIPLES OF VOTING).

As compared with modern practice the function of voting was restricted. Thus in the small democracies of Greece the use of the lot largely supplanted polling for the election of magistrates; at Athens voting was limited to the choice of officers with special technical qualifications. (2) In accordance with the theory which regarded residence at the seat of government as a condition of franchise, the suffrage could as a rule only be exercised in the capital town. The only known exception under a centralized government was in the event of an army moved out of its usual quarters to the country under Julius Caesar and Augustus, who arranged for polling stations to be opened at election-time in the country towns of Italy. In federal governments the election of deputies to a central legislature seems to be attested by the practice of the Achaean League, where the federal council was probably elected in the several constituent towns. But little is known as to ancient methods of electing delegates to representative institutions, and in general it may be said that the function of suffrage in Greece and Italy throws no light upon contemporary problems, such as the use of single-area constituencies and proportional representation.

Modern.—The modern method of obtaining a collective expression of opinion of any body of persons may be either "open" or secret. An open expression of opinion may be by some word of assent or negation, or by some visible sign, as the holding up of a hand. Indeed any method of voting which does not expressly make provision for concealing the identity of the person registering the vote is "open." Some methods of voting are still employed (as in the case of parliamentary elections for some of the English universities, where votes may be sent by post) must necessarily reveal the manner in which the elector has recorded his vote. It is in connexion with the election of members of representative bodies—especially legislative bodies—that the qualifications for and methods of voting become especially important. Practically every civilized country has accepted and put in force some form of representation, which may be defined as the theory and principles on which the obtaining of a vote is based. These are dealt with in the article REPRESENTATION, and it will be sufficient to give here the various qualifications which are considered by different countries as sufficient to give effect to the principle of representation and the methods of recording votes. In detail these are given for the United Kingdom and the United States in the articles REGISTRATION OF VOTERS and ELECTIONS, and for other countries under their respective titles in the sections dealing with the Constitution.

The first consideration is the age at which a person should be qualified for a vote. This in a large number of countries is fixed at the age of manhood, namely, twenty-one years of age, but in Hungary the age is fixed at twenty years, in Austria twenty-four years, while in Belgium, Baden, Bavaria, Hesse, Prussia, Saxony, Japan, the Netherlands and Norway the age is twenty-five years, and in Denmark thirty years. Some countries (e.g. Austria, Germany, France) have adopted the principle of what is often termed "manhood or universal suffrage," i.e. every male adult, not a criminal or a lunatic, being entitled to a vote, but in all cases some further qualifications may be involved as to the exercise of the franchise by manhood and property in a certain qualifying period of residence. This tangible sign of interest in the state may take the form of possession of property, however small in amount, or the payment of some specific amount of direct taxation, indeed in some cases, as will be seen, this is rewarded by the conferring of extra votes.

In the United Kingdom possession of freehold or leasehold property of a certain value or occupation of premises of a certain annual value gives a vote. This qualification of property may be said to be included in what is termed the "lodger" vote, given to the occupier of lodgings of the yearly value unfurnished of not less than 200 guineas. In Hungary, the payment of a small direct tax on house property or land or on an income varying with occupation is necessary. So in Prussia, Saxony, Bavaria, Hesse, Italy (unless a certain standard in elementary education has been reached), Japan, the Netherlands, Portugal (unless the elector is able to read and write) and Russia. Some of the states in the United States also require the payment of a poll tax. On the other hand, in Russia, students, soldiers, governors of provinces and police officers are disqualified from voting; in Portugal, bankrupts, beggars, disabled soldiers, servants, workmen in government service, and non-commissioned officers are not electors; it must be noted, however, that the government
VOTING MACHINES

of the new Portuguese republic promised in 1910 a drastic revision of the existing franchise. Italy disfranchises non-commissioned officers and men in the army while under arms, as do France and Brazil. The United Kingdom and Denmark disqualify those in actual receipt of parish relief, while in Norway, apparently, receipt of parish relief at any time is a disqualification, which, however, may be removed by the recipient paying back the sums so received. In some countries, e.g. Brazil, the suffrage is refused to members of monastic orders, &c., under vows of obedience. Apart from those countries where a modicum of education is necessary as a test of right to the franchise, there are, of course, the provisions made by law for determining who are entitled to vote, which in granting the franchise. In the United Kingdom the members of eight universities (Oxford, Cambridge, London, Dublin University, Glasgow, Edinburgh, Aberdeen and St Andrews) send nine members to parliament; in Hungary members of the professional, scientific, learned and other classes (over 80,000) are entitled to vote without any other qualification; in Brunswick the scientific classes elect three members to the legislative chamber; in Saxony, members of scientific or artistic professions have extra votes; in Italy, members of academies of science; in Algeria, qualified to vote by their position; while in the Netherlands legal qualifications for any profession or employment give a vote.

Many objections have been urged of late years to the principle of according a plurality of votes to one individual on account of superior qualifications over others which he may be considered to possess. In the United Kingdom, where, roughly speaking, the principle of representation is that of taxation, the possession of qualifying property in any number of electoral districts will give a vote in each of those districts. Whether those votes can be actually registered will of course depend on certain circumstances such as the distance of the districts apart and whether the elections are held on the same day or not. The Radical party in the United Kingdom have of late years been hostile to any system of plurality of votes (whether gained by educational, property, or other qualifications), though it may be said that the tendency of some recent electoral systems has been to introduce a steadying principle of this nature. In 1906 a bill was introduced for reducing the system of plural voting in the United Kingdom; it passed through the House of Commons, but was rejected by the House of Lords. The most remarkable system of plural voting that has been introduced in Belgium by the electoral law of 1894. Under it, every citizen over thirty-five years of age with legitimate issue, and paying at least 5 francs a year in house tax, has a supplemental vote, as has every citizen over twenty-five owning immovable property to the value of 2000 francs, or having a corresponding income from such property, or who for two years has derived at least 100 francs a year from Belgian funds either directly or through the savings bank. Two supplementary votes are given to citizens over twenty-five who have received a diploma of higher instruction, or a certificate of higher secondary instruction, or who fill or have filled offices, or engaged in private professional instruction, implying at least average higher instruction. Three votes is the highest number allowed, while failure to vote is punishable as a misdemeanour. In 1908-9 the number of electors in Belgium was 1,657,647, of whom 981,866 had one vote, 378,264 two votes and 291,517 three votes. In some other countries weight is given to special qualifications. In the town of Bremen the government is in the hands of a senata of 16 members and a Chamber of Bürgerschaft of 130 members. These latter are elected by the votes of all the citizens divided into classes. University men return 14 members, merchants 40 members, mechanics and manufacturers 20 members, and the other inhabitants the remainder. So in Brunswick and in Hamburg legislators are returned by voters representing various interests. In Prussia, representatives are chosen by direct electors who in their turn are elected by indirect electors. One direct elector is elected from every complete number of 250 souls. The indirect electors are divided into three classes, the first class comprising those who pay the highest taxes to the amount of one-third of the whole; the second, of those who pay the next highest amount down to the limits of the second third; the third, of all the lowest taxed. In Italy electors must either have attained a certain standard of elementary education, or pay a certain amount of direct taxation, or if peasant farmers pay a certain amount of rent, or if occupants of lodgings, shops, &c., in towns, pay an annual rent according to the population of the commune. In Japan, voters must pay either land tax of a certain amount for not less than a year or direct taxes other than land tax for more than two years. In the Dutch colonies, householders, or those who have paid the rent of houses or lodgings for a certain period, are qualified for the franchise, as are owners or tenants of boats of not less than 24 tons capacity, as well as those who have been for a certain period in employment with an annual wage of not less than £22, 18s. 4d., have a certificate of state interest of not less than 100 florins or a savings bank deposit of not less than 50 florins. The method now adopted in most countries of recording votes is that of secret voting or ballot (q.v.). This is carried out sometimes by a machine (see VOTING MACHINES). The success or failure of a candidate in a constituency varies greatly in different countries. In the United Kingdom the candidate who obtains a relative majority is elected, i.e. it is necessary only to obtain more votes than any other candidate (see REPRESENTATION). VOTING MACHINES. The complications in the voting at American elections have resulted in the invention of various machines for registering and counting the ballots. These machines are in fact mechanical Australian ballots. The necessity for them has been emphasized by election practice in many parts of the United States, where in a single election there have been from five to ten parties on the ballot, with an aggregate of four hundred or five hundred candidates, making the paper ballots large and difficult to handle. The objections to the paper ballot are further emphasized in the results obtained. The number of void and blank ballots is seldom less than 5% of the number of voters voting, and is often as high as 40%. This lost vote is often greater than the majority of the successful candidate. In close elections there is an endless dispute as to whether the disputed ballots do or do not comply with the law. The election contest and recount expenses from above $100,000. The aggregate number of the candidates to the office is frequently held in abeyance by a protracted contest until after the term of office has expired. A number of ways have been devised for marking the Australian ballot for identification without destroying its legality. The X is a very simple and well-known mark, yet in the case of Coulahan v. White, before the Supreme Court of Maryland, twenty-seven different ways of making the mark "X" were shown in the ballots in controversy, and all of them were a subject for judicial consideration, on which the judges of even the highest court could, find room for disagreement. Wigmore in his book on the Australian ballot system points out thirteen ways of wrongly placing the mark, and forty-four errors in the style of the mark, besides many other errors tending to invalidate the ballot, all of them having frequently occurred in actual practice. These errors are not confined to the illiterates, but are just as common among the best-educated people. The ballots can and have frequently been altered or discountered by unscrupulous election officers, and the detection of the fraud is frequently difficult and always expensive. Voting machines were devised first by English, and later with more success by American inventors. The earlier machines of Vassie, Chamberlain, Syderiff (1869) and Davie (1870) were practically all directed toward voting for the candidates of a single office by a ball, the ball going into one compartment or the other according to the choice of the voter. The use of the ball in accordance with the original idea of ballot, which means "a little ball"; and because of the requirement of many of the constitutions of the states of the United States, that "elections shall be by ballot," many American inventors
follow this idea of using balls to indicate their votes. Others, however, maintaining that secrecy was the essential idea of voting by ballot, and that the form of the ballot was immaterial, worked out a machine using a lever. If, for example, under date, the counter registering the successive impulses given to it by the key, the machine preventing the voter from giving the key more than one impulse, and preventing the voter from operating more keys than he is entitled to vote. The highest courts of four different American states have ruled that any form of voting machine that secured secrecy would be constitutional.

The first voting machine used in an election was the Myers Ballot Box. It was used in New York in 1892. It had a vertical keyboard with columns of push keys thereon, each column representing a party, and each key belonging to a candidate of that party, the keys of each horizontal line belonging to the candidates of the various parties for a particular office. The voter pushed one of the keys in each office line, which knob operated its counter and locked all other possible votes for the same office until the voter left the booth. The operated keys were released by the operation of the second booth door as the voter left the machine, and they were then reset by springs. The doors were so arranged that the voter must first pass through one and lock it behind him before he could pass through the second and get out. This both preserved secrecy and prevented repeating. Some sixty-five or more of these machines were used in the election in the city of Rochester, N.Y., in November 1886, and with marked success.

Punishing the machine, operated by keys which punched holes in a web of paper. On this web the votes of each candidate were all punched in a single column, each separate column representing a separate candidate. The voter did not see the paper until he had passed the machine by the election officers after the election is over, and the vote thereon is canvassed by passing the web through a pneumatic counting machine. The paper web makes a separate record of each vote cast, not that cast in the tabulated by a machine with a separate counter in the use of the machine. The machine is also slow in giving returns, due to the fact that the vote has to be counted after the election.

In the other types of machines each candidate had a separate receptacle, into which the machine dropped a ball for each vote that was cast for the candidate. These machines have so far been successful. The whole development of practical voting machines has been limited to the ballot box machine, but a separate counter is provided for each candidate, the counter being operated either directly or indirectly by the voter. Of this type is the Myers machine, the Bardwell Votometer had a separate counter for each candidate, with a single key for operating all the counters on the machine. A keyhole was provided in each counter, in which the key could be inserted, and by turning it the counter was indexed. The key could be removed for use in another counter. The voter could operate but one counter at a time, and could not operate the counters in very rapid succession. The separators were arranged to take care of the slowness with which it can be worked. The voter enters this machine by raising a bar at one end, which unlocks the counters for voting operation. Raising a similar bar at the other end, the voter passes out resets the machine for the next voter and locks it.

The Abbott Machine has attained considerable use in the state of Michigan. In this machine the counters for each office are carried on a separate slide, and the voter moves these slides for the various offices from left to right, until the counter carrying the name of the candidate of his choice in each office row is lined up with the operating bar. The vertical movement of the operating bar on each of these slides, rings a bell, which notifies the election officer that a vote has been cast, and locks the machine against further voting. The election officer then moves a slide which resets the bar in readiness for the next voter. The machine is not used because two or more candidates on the same office line cannot be voted for by the same voter, although the voter may be entitled to vote for more than one candidate.

The U.S. Patent Office has had the most extensive use of any. A separate key is provided for each candidate, which keys are arranged on the keyboard of the machine in horizontal rows and vertical office lines. Each key is indexed so that it swings downward from horizontal position and points to the name of the candidate below it. The key is indexed consecutively by party rows, and numbered by office rows, so that each key bears a number and a letter distinguishing it from all others. At the left of each party row is a party lever, by the movement of which all of the keys of that party are indexed. If the voter desires to have no candidates on the ballot these levers are omitted. Extending outward from the top of the machine is a rail, from which is suspended a curtain. Prorveted in the middle of the top of the machine is a lever, which extends outwardly and has a loose connection with a curtain. The operation of the lever by a convenient handle enables the voter to close the curtain and unlock the machine for voting, after which the voter cannot retire from the machine until he has voted on the machine to a certain extent. The operation of any one of the party levers rings a bell to show that he has voted, and permits the reverse movement of the curtain lever, which counts the vote, resets the machine for the next voter and opens the curtain. Before returning to the machine the voter is not permitted to be exposed to the light by lifting the curtain.

Each state that adopts voting machines first enacts a law specifying the requirements that must be met in the construction of the machines. These requirements are substantially the same in all the states, the laws being copied largely from the New York Voting Machine Law. The laws require in general that the machine shall give the voter all the facilities for expressing his choice which the Australian ballot gives him, and further require that the machine shall prevent such errors or frauds, which if made on an Australian ballot would invalidate it.

Many of the states have special requirements, to meet which many ingenious features have been provided on the various machines. Among these is the group of 18 supervisors in San Francisco, for whom office as many as 100 candidates have appeared upon one ballot, out of which the machine must permit the voter to vote any 18 and no more, regardless of the sequence in which they are selected, or the position in which they occur. A feature of these local features is the primary election feature required by Minnesota, in which state the various parties must hold their primary election at the same time and on the same machine. The voter announcing the party of his preference finds the voting machine has been locked against him, but the voting machines of his own party are open to his use.

Still another is the locking out, by which the voter of limited voting from publishing his preference. The counting machine provides in offices. Another is the endorsed candidate in a group. Here the same candidate's name is provided with two or more voting devices in a group wherein the voter is allowed to vote for two or more of the candidates. Special care must be taken to keep voters from voting twice for the same candidate.

As to the important benefits attending the use of machines, there can be mentioned accuracy both in the casting and the counting of the vote, speed in getting in returns, and economy in holding elections. The improvement in accuracy is shown by the fact that the vote for each office usually runs 99% or more of the highest possible vote that could be registered by the number of voters that have voted. Speed is shown by the fact that in the city of Buffalo, with 60,000 voters voting on election day, the complete returns, including the vote on over 100 candidates for the whole city, have been collected, tabulated and announced within 75 minutes from the closing of the polls.

Economy is shown by the fact that although these machines are used but one or two days in each year, election expenses are reduced to such an extent that the machines pay for themselves in five or six elections. This is partly due to the smaller number of precincts necessary and the smaller number of election officers in each precinct and the shorter hours that they must work. The city of Buffalo has a dozen or more precincts, in each of which 2500 or more are voted in an election, while in the city and county as a whole 1041 voters have voted in one election day on one machine.

(F. Kr.)
VOUSSOIR (Ger. Wöllestein), the French term used by architects for the wedge-shaped stones or other material with which the arch (q.v.) is constructed; the lowest stone on each side is termed the springer (Fr. coutoîs sommier) and the upper one at the crown of the arch the keystone (Fr. claveau).

VOW (Lat. votum, vow, promise; cf. VOTE), a transaction between a man and a god, whereby the former undertakes in the future to render some service or gift to the god or devotees something valuable now and here to his use. The god on his part is reckoned to be going to grant or to have granted already some special favour to his votary in return for the promise made or service declared. Different formalities and ceremonies may in different religions attend the taking of a vow, but in all the wrath of heaven or of hell is visited upon one who breaks it. A vow has to be distinguished, firstly, from other and lower ways of persuading or constraining supernatural powers to give what man desires and to help him in time of need; and secondly, from the ordered ritual and regularly recurring ceremonies of religion. These two distinctions must be examined a little more at length.

It would be an abuse of language to apply the term vow to the uses of imitative magic, e.g. to the action of a barren woman among the Battas of Sumatra, who in order to become a mother makes a wooden image of a child and holds it in her lap. For in such rites no promiss is given to the idea— even if it exists—of a personal relation between the petitioner and the supernatural power. The latter is, so to speak, mechanically constrained to act by the spell or magical rite; the forces liberated in fulfilment, not of a petition, but of a wish are not those of a conscious will, and therefore no thanks are due from the wisher in case he is successful. The deities, however, to whom vows are made are expected to reward individuals, and personal beings, capable of entering into contracts or covenants with man, of understanding the claims which his vow establishes on their benevolence, and of valuing his gratitude; conversely, in the taking of a vow the petitioner's pieté and spiritual attitude have begun to outweigh those merely ritual details of the ceremony which in magical rites are all-important.

Sometimes the old magical usage survives side by side with the more developed idea of a personal power to be approached in prayer. For example, in the Magrib (in North Africa), in time of drought the maidens of Mazouma carry every evening in pro-

cession through the streets a doll called ghnijis, really a dressed-up wooden spoon, symbolizing a pre-Islamic rain-spirit. Often one of the girls carries on her shoulders a sheep, and her companions sing the following words:

"Rain, fall, and I will give you my kid.
He has a black head; he neither bleats
Nor complains; he says not, 'I am cold.'
Rain, who fillest the skins,
Wet our raiment.
Rain, who feedest the rivers,
Overturn the doors of our houses."

Here we have a sympathetic rain charm, combined with a prayer to the rain viewed as a personal goddess and with a promise or vow to give her the animal. The point of the promise lies of course in the fact that water is in that country stored and carried in sheep-skins.

Secondly, the vow is quite apart from established cults, and is not provided for in the religious calendar. The Roman vow (votum), as W. W. Fowler observes in his work The Roman priest (1899), p. 346, "was the exception, not the rule; it was a promise made by an individual at some critical moment, not the ordered and recurring ritual of the family or the State." The vow, however, contained so large an element of ordinary prayer that in the Greek language and the same word (eixo) expressed both. The characteristic mark of the vow, as Suidas in his lexicon and the Greek Church fathers remark, was that it was a promise either of things to be offered to God in the future and at once consecrated to Him in view of their being so offered, or of austerities to be undergone. For offering and austerity, sacrifice and suffering, are equally calculated to appease an offended deity's wrath or win his goodwill.

The Bible affords many examples of vows. Thus in Judges xi. Jephthah "vowed a vow unto the Lord, and said, If thou wilt indeed deliver the children of Ammon into my hand, then it shall be that whosoever cometh forth out of the doors of my house to meet me, when I return in peace from the children of Ammon, it shall be the Lord's, and I will offer it up for a burnt-offering." In the sequel it is his own daughter who so meets him, and he sacrifices her after a respite of two months granted her in order to "bawl her virginity upon the mountains." A thing or person thus vowed to the deity became holy or taboo; and for it, as the above story indicates, nothing could be substituted. It belonged to once to the sanctuary or to the priests who represented the god. In the Jewish religion, the latter, under certain conditions, defined in Leviticus xxvii., could permit it to be redeemed. But to substitute an unclean for a clean beast which had been vowed, or an imperfect victim for a flawless one, was to court with certainty the divine displeasure.

It is often difficult to distinguish a vow from an oath. Thus in Acts xxiii. 21, forty Jews, enemies of Paul, bound themselves, under a curse, neither to eat nor to drink till they had slain him.

In the Christian Fathers we hear of vows to abstain from flesh diet and wine. But of the abstentions observed by votaries, those which had relation to the barber's art were the commonest. Wherever individuals were concerned to create or confirm a tie connecting them with a god, a shrine or a particular religious circle, a hair-offering was in some form or other imperative. They began by polling their locks at the shrine and left them as a soul-token in charge of the god, and never polled them afresh until the vow was fulfilled. So Achilles consecrated his hair to the river Spercheus and vowed not to cut it till he should return safe from Troy; and the Hebrew Nazarites, whose strength was supposed to reside in his flowing locks, only cut them off and burned them on the altar when the days of his vow were ended, and he could return to ordinary life, having achieved his mission. So in Acts xviii. 18 Paul "had shorn his head in Cenchreae, for he had a vow."

In Acts xx. 23 we hear of four Jews who, having a vow on them, had their heads shaved at Paul's expense. Among the ancient Chatti, as Tacitus relates (Germania, 31), young men allowed their hair and beards to grow, and vowed to court danger in that guise..."
VOZNESENSK—VRIENDT

until they each had slain an enemy. Robertson Smith (Religion of the Semites, ed. 1901, p. 483) with much probability explains such usages from the widespread primitive belief that a man’s life lurks in his hair, so that the devotee being consecrated or taboo to a god, his hair must be retained during the period of taboo or purification (as it is called in Acts xxi. 26) lest it be dissipated and profaned. The hair being part and parcel of the votary, its profanation would profane him and break the taboo.

The same author remarks that this is why, when the hair of a Hindu chief is cut, it was, being like the rest of his person sacred or taboo, collected and buried in a sacred place or hung on a tree. And we meet with the same scruple in the initiation rite, called syjma, of Eastern monks. First, the novice is carefully denuded of the clothes, shoes and headgear, which he wore in the world, and which, being profane or unclean, would violate the taboo about to be set on him. His hair is then polled crosswise by way of consecrating it; and in some forms of the rite the presiding monk, called "the father of the hair," collects the shorn locks and deposits them under the altar or on some other safe and sacred place. Greek nuns used to keep the hair thus shaved, or shaved, and wore it into girdles, and wear it for the rest of their lives round their waists, where close to their holy persons there was no risk of its being defiled by alien contact. The rest of this rite of syjma, especially as it is preserved in the old Armenian versions, smacks no less of the most primitive taboo. For the novice, after being thus tonsured, advances to the altar holding a taper in either hand, just as tapers were tied to the horns of an animal victim; the new and sacred garb which is to demarcate him henceforth from the unclean world is put upon him, and the precluding father laying his right hand upon him devotes him to a prayer which begins thus:

"To thee, O Lord, as a rational whole burnt-offering, as mystic frankincense, as voluntary homage and worship, we offer up this thy servant N. or M."

From the same point of view is to be explained the prohibition to one under a vow of flesh diet and fermented drinks; for it was believed that by partaking of these a man might introduce into his body the unclean spirits which inhabited them—the brute soul which infested meat, especially when the animal was strangled, and the cardiac demon, as the Rabbis called it, which harboured in wine.

The same considerations help to explain the custom of votive offerings. Any popular shrine in Latin countries is hung with wax models of limbs that have been healed, of ships saved from wreck, or with pictures representing the votary’s escape from perils by land and sea. So Cicero (de Doctrin Naturae, iii. 37) relates how a friend remarked to Diogoras the Atheist when they reached Samothrace: “You who say that the gods neglect men’s affairs, do you not perceive from the many pictures how many have escaped the force of the tempest and reached harbour safely?” Diogoras’ answer, that the many more who had suffered shipwreck and perished had no pictures to record their fate does not concern us here. It is only pertinent to remark that these votive tabellae and offerings may have had originally another significance than that of merely recording the votary’s salvation and of marking his gratitude. The model ship may be a substitute for the entire ship which is become sacred to the god, but cannot be deposited in the shrine; the miniature limbs of wax are substitutes for the real limbs which now belong to the god. In other cases the very objects which are taboo are given to the god as when a sailor deposits his salt-stained suit before the idol.

The general idea, then, involved in vows, whether ancient or modern, is that to express which the modern anthropologist borrows the Polynesian word taboo. The votary desirous to “antedate his future act of service and make its efficacy begin at once,” formally dedicates through spoken formula and ritual act a lifeless object such as a ring, an animal, his hair or his entire person to the god. He so either makes sure of future blessings, or shows gratitude for those already conferred. Most of the ritual prescriptions that accompany vows are intended to guard inviolate the sanctity or taboo, the atmosphere of holiness or ritual purity, which envelopes the persons or objects vowed or reserved to the god, and thereby separated from ordinary secular use.

The consideration of the moral effect of vows upon those who take them belongs rather to the history of Christian asceticism. It may, however, be remarked here that monkish vows, while they may tend to a man’s life a certain fixity of aim and moral intensity, nevertheless tend to narrow his interests, and paralyse his wider activities and sympathies. In particular monastic vows, especially those to lifelong and often morbid struggle against the order of nature; and motives become for him not good or bad according to the place they occupy in the living context of social life, but according as they bear upon an abstract and useless ideal. (F. C. C.)

VOZNESENSK, a town of Russia, in the government of Kherson, on the left bank of the river Bug, at the head of navigation, 55 m. N.W. from Nikolayev, to which steamers ply regularly. Pop. 14,178. It is a river port of some importance, and holds four large fairs annually. It contains a cathedral, which is famous for its paintings and for the small shrines dedicated to it, which have been translated to various places; and for the little shrines dedicated to its patrons, the Archangels Michael and Gabriel, in which are preserved the remains of the soldiers who were buried in them. The town is also famous for its breweries.

VRANČI, SEBASTIAN, born about 1572, was a painter of the Antwerp school, of very moderate ability. Most of his pictures represent scenes of war, such as the sack of towns, cavalry combats, and the like. Though occasionally vigorous in drawing, his paintings are dull and heavy in tone. The date of his death is uncertain.

VRANŢA, or Vranţe, the most southerly town of the kingdom of Servia, 73 m. from the Macedonian frontier, on a slope descending from Mount Placevitza to the plain of the Upper Morava, in a picturesque and fertile country. Pop. (1900) 11,921. In the Russo-Turkish War of 1877 it was captured by the Servian army from the Turks, and subsequently was incorporated in the kingdom. It is the capital of a department of the same name, and is an important station on the railway from Nish to Salonica, with a custom house, principally for merchandise imported into Servia via Salonica. Its inhabitants are employed chiefly in the cultivation of flax and hemp, and in the making of ropes. There is a much frequented summer resort 4½ m. E., called Vranyska Banya, with baths of hot sulphurous mineral water.

VRATZA, the capital of the department of Vratza, Bulgaria, on the northern slope of the Stara Planina and on a small subtributary of the Danube. Pop. (1906) 14,832. Vratza is an archiepiscopal see and the headquarters of a military division. Wine, leather and gold and silver filigree are manufactured, and there is a school of sericulture.

VRIENDT, JULIEN JOSEPH DE (1842—), and ALBRECHT FRANÇOIS LIEVEN DE (1843-1900), Belgian painters, both born at Ghent, sons of a decorative painter. The two brothers were close friends, and their works show marked signs of resemblance. Having received their early training from their father at Ghent, they removed to Antwerp, where they soon yielded to the influence of the painter Baron Henri Leys. Albrecht became director of the Academy of Fine Arts at Antwerp and was succeeded by his brother. Albrecht’s principal works are "Jacqueline of Bavaria imploring Philip the Good to pardon her Husband" (1871, Liège Gallery), "The Excommunication of Bouchard d’Avesnes" (1877, Brussels Gallery), "The Angelus" (1877, acquired by Leopold II., king of the Belgians), "Pope Paul III. before Luther’s Portrait" (1885, Antwerp Gallery), "The Citizens of Ghent paying homage to the child Charles V." (1885, Brussels Gallery), "Philip the Handsome wearing fidelity to the privileges of the Town of Furnes" (1893, Furnes town hall), "The Virgin of St Luc" (1894, triptych in Antwerp Cathedral), and the decoration of the municipal hall at Bruges, which was completed by his brother. Among Julien’s more notable works are "The Citizens of Eisenach driving out St Elizabeth of Hungary" (1871, Liège Gallery), "Jairus’ Daughter" (1888, Antwerp Gallery), mural paintings in the Palais de Justice at Antwerp (1893), and "The Christmas Carol" (1894, Brussels Gallery).
VRYHEID—VULTURE 221

VRYHEID, a town of northern Natal, 391 m. by rail N. by W. of Durban. Pop. (1904) 2287, of whom 1344 were whites. It is the chief town of a district, of the same name, rich in mineral wealth, including copper, coal and gold. The coal-fields of Hlobane are S.E. of the town. Originally part of Zululand the district of Vryheid was ceded by Dinzulu to a party of Boers under Lucas Meyer, who aided him to crush his opponents, and was proclaimed an independent state under the title of the New Republic in 1884. In 1888 it was incorporated with the Transvaal and in 1903 annexed to Natal (see TRANSVAAL, § History; and ZULULAND, § History).

V-SHAPED DEPRESSION, in meteorology, a narrow area of low pressure usually occurring between two adjacent anticyclones, and taking the form of a V or tongue, as do the isobars representing it on a weather-chart. Such a depression may be regarded as a projection from a cyclonic system lying to one side of the two anticyclones. A similar depression, however, is frequently formed within a larger area of depression, i.e., an ordinary cyclone, and sometimes develops so far as to have a complete circulation of its own; it is then known as a secondary.* The line of lowest depression following the axis of the V-tongues with its heavy equals and a sudden change of wind from one direction almost to the opposite. It is preceded by signs of break in the weather such as usually herald the approach of an ordinary cyclone, and is followed by the usual signs of clearance. The occurrence of a V-depression or secondary within an ordinary cyclonic system intensifies, often to a dangerous degree, the usual disturbances in the weather accompanying that system. Conditions exactly opposite to those accompanying a V-shaped depression are provided by a "wedge" (q.v.).

VULCAN (Volcanus), the Roman god of fire, and more especially of devouring flame (Virg. Aen. 5. 662). Whether he was also, like Hephaestus, the deity of smiths, is very doubtful; his surname Muciber may rather be referred to his power to ally conflagrations. In the Comitium was an "area Volcani," also called "Volcanal;" and here on the 23rd of August (Volcanalia) the Flamen Volcanalis sacrificed, and the heads of Roman families threw into the fire small fish, which the Tiber fishermen sold on the spot. This flamen also sacrificed on the 1st of May to Maia, who in an old prayer formula (Gellius 13. 23) was coupled with Vulcanus as Maia Volcani. It is not easy to explain these survivals of an old cult. But in historical times the association of this god with conflagrations becomes very apparent; when Augustus organized the city in regions and vicini to check the constant danger from fires, the magistri vicorum (officers of administrative districts) worshipped him as Vulcanus quietus augustus (C.I.L. vi. 801 and 802) and on the 23rd of August there was a sacrifice to him together with Ops Opifera and the Nymphae, which suggests the need of water in quenching the flames. At Ostia, where much of the corn was stored which fed the Roman population, the cult of this god became famous; and it is probable that the fixing of his festival in August by the early Romans had some reference to the danger to the newly harvested corn from fire in that month. (W. W. F.)*

VULGATE (from Lat. vulgus, the common people), a Latin version of the Bible prepared in the 4th century by St Jerome, and so called from its common use in the Roman Catholic Church (see BIBLE: Texts and Versions). Pius X. in 1908 entrusted to the Benedictine Order the task of revising the text, beginning with the Old Testament.

VULPES, CHRISTIAN AUGUST (1752–1827), German author, was born at Weimar on the 23rd of January 1752, and was educated at Jena and Erlangen. In 1790 he returned to Weimar, where Goethe, who had entered into relations with Vulpis's sister Christine (1765–1816), whom he afterwards married, obtained employment for him. Here Vulpis began, in imitation of Christian Heinrich Spieß, to write a series of romantic narratives. Of these (about sixty in number) his Rinaldo Rinaldini (1797), the scene of which is laid in Italy during the middle ages, is the best. In 1797 Vulpis was given an appointment on the Weimar library, of which he became chief librarian in 1866. He died at Weimar on the 23rd of June 1827.

VULTURE, the name of certain birds whose best-known characteristic is that of feeding upon carcases. The genus Vultur, as instituted by Linnaeus, is now restricted by ornithologists to a single species, V. monachus. The other species included therein by him, or thereto referred by succeeding systematists, being elsewhere relegated (see LAMMERGEYER). A most important taxonomic change was introduced by T. H. Huxley (Proc. Zool. Society, 1867, pp. 452–64), who pointed out the complete structural difference between the vultures of the New World and those of the Old, regarding the former as constituting a distinct family, Cathartidae (which, however, would be more properly named Sarcorhamphidae), while he united the latter with the ordinary diurnal birds of prey as Gypaudae.

The American vulture may be said to include four genera: (1) Sarcorhamphus, the gigantic condor, the male distinguished by a large fleshy comb and wattle; (2) Gypagus, the king-vulture, with its gaudily coloured head and nasal caruncle;

King Vulture (Gypagus papa).

(3) Catharista, containing the so-called turkey-buzzard with its allies; and (4) Pseudogyps, the great Californian vulture —of very limited range on the western slopes of North America. Though all these birds are structurally different from the true vultures of the Old World, in habits the Vulturidae and Sarcorhamphidae are much alike.

The true vultures of the Old World, Vulturidae in the restricted sense, are generally divided into five or six genera, of which Neophron has been separated as forming a distinct subfamily, Neophroninae—its members, of comparatively small size, differing both in structure and habit considerably from the rest. One of them is the so-called Egyptian vulture or Pharaoh's hen, N. percnopterus, a remarkably foul-feeding species, living much on ordure. It is a well-known species in some parts of India, and thence westward to Africa, where

1 In the eastern part of the Indian peninsula it is replaced by a smaller race or (according to some authorities) species, N. ginginarius, which has a yellow instead of a black bill.
it has an extensive range. It also occurs on the northern shores of the Mediterranean, and has strayed to such a distance as to have suffered capture in England and even in Norway. Of the genera composing the other subfamily, Vulturinae, *Gyps* numbers seven or eight local species and races, on more than one of which the English name griffin has been fastened. The best known is *G. fulvus*, which by some authors is accounted "British" from an example having been taken in Ireland, though under circumstances which suggest its appearance so far from its nearest home in Spain to be due to man's intervention.

The species, however, has a wider distribution on the European continent (especially towards the north-east) than has the Indian vulture, and in Africa nearly reaches the Equator, extending also in Asia to the Himalaya; but both in the Ethiopian and Indian regions its range incoalesces with that of several allied forms or species. *Pseudogyps* with two forms—one Indian, the other African—differs from *Gyps* by having 12 instead of 14 rectrices. Of the genera *Oopectes* and *Lophogyps* nothing here need be said; and then we have *Vultur*, with, as mentioned before, its sole representative, *V. monachus*, commonly known as the cinereous vulture, a bird which is found from the Straits of Gibraltar to the Scandinavian coasts. Most of the polygonal cliffs, inhabited by the last-named two species of vultures, exist on the lodes of which they build their nests.

The question whether vultures in their search for food are guided by sight of the object or by its scent has excited much interest. It seems to be now generally admitted that the sense of sight is in almost every case sufficient to account for the observed facts.

(A.N.)

**VURJEEVANDAS MADHOWDAS** (1817-1896), Hindu merchant of Bombay, of the Kapole Bania caste, was born on the 29th of January 1817 at Gogla, in Kathiawar, whence his father came to Bombay with Sheth Mandeo Maravar. Vurjeevandas was educated in Bombay, started a new firm under the name of Vurjeevandas & Sons, and soon became one of the wealthiest merchants in Bombay. He was appointed a justice of the peace and a member of the Bombay Port Trust. He took a keen interest in the Royal Asiatic Society and the Bombay university, where a prize has been established to commemorate his name. He constructed the Madhow Bang in memory of his father, and gave it to the use of poor Hindus,/endowing it with nearly five lakhs of rupees. He built a rest-house in Bombay in memory of his brother Moolinhe, and another one at Nasik. The sanatorium which he built in memory of his youngest son Rumphoredas at Sion Hill is a great boon to the poor people of his community.

He also established a dispensary at Matoonga and a fund for the relief of indigent Hindus. He died on the 12th of January 1866.

**VYATKA**, or *Viatka*, a government of N.E. Russia, with the government of Vologda on the N., Perm on the E., Ufa and Kazan on the S. and Nishnii-Novgorod and Kostroma on the W., having an area of 50,100 sq. m. It has on its northern boundary the flat water-parting which separates the basins of the Northern Dvina and the Volga, and its surface is an undulating plateau 800 to 1400 ft. above sea-level, deeply grooved by rivers and assuming a hilly aspect on their banks. The Kama rises in the N.E., and, after making a wide sweep through Perm, flows along its S.E. boundary, while the rest of the government is drained by the Vyatka and its numerous tributaries. Both the Kama and the Vyatka are navigable, as also are several tributaries; the Izh and Volka, which flow into the Vyatka, have important ironworks on their banks. The only railway is one from Perm to Archangel, through the town of Vyatka; the government is traversed by the great highway to Siberia, and by two other roads by which goods from the south are transported to loading-places on the Vychegado and the Yug to be shipped to Archangel. Lakes are numerous, and vast marshes exist everywhere, especially in the north. The climate is very severe, the average yearly temperature being 36° F. at Vyatka (January, 8°-2°; July, 67°-0°) and 35° at Slobodsk (January, 3°-5°; July, 65°-5°).

The estimated pop. in 1906 was 3,532,600. The bulk of the inhabitants (78%) are Russians; Votyaks make 12% and Cheremisses 5% and Tatars 3%. The remainder being Bashkirs, Teptysters and Permynaks. The Votyaks (Otyaks) and Finnish tribe, call themselves Ot, Ut or Ud, and the Tatars from Ar, so that they may possibly be akin to the Ars of the Yenisei. They are middle-sized, with fair hair and eyes, often red-haired; and the general structure of the face and skull is Finnish. By their dialect they belong to the same branch as the Permynaks.

The government is divided into eleven districts, the chief towns of which are Vyatka, Elabuga, Glazov, Kotel'nikh, Mal'mysh, Nolinsk, Orlov, Sarapul, Slobodsk, Uzhuhum and Yaran. Izhvask and Voronezk, the former of which, with Kamensk and N. are nearly 85% of the surface is covered with forests, two-thirds of which belong to the crown, and hunting (especially squirrel-hunting) and fishing are of commercial importance. The peasants form 89% of the population, own 44% of the whole government, the crown 53% and private persons 2%. The soil is fertile, especially in the valleys of the south. Vyatka is one of the chief grain-producing governments of Russia. The principal crops are rye, wheat, oats, barley and potatoes. Flax and hemp are extensively cultivated, and large numbers of cattle are kept, but they are mostly of inferior breed. The government has a race of good ponies that are exported. Domestic industries occupy large numbers of the inhabitants. The principal manufacturing establishments are tanneries, distilleries, ironworks, chemical works, glass factories, flour-mills, and hardware, machinery, paper and fur-dressing works.

**VYAZMA**, a town of Russia, capital of the government of the same name, on the Vyatka river, 304 m. by rail W.N.W. of Perm. Pop. 24,782. It is built on the steep hills which rise above the river and at their base. Its old walls have been demolished, and its old churches built anew. It is an episcopal see and has a fine cathedral. Its manufactures include silver and copper wares, and ecclesiastical ornaments, and it has an important trade in coal, leather, tallow, candles, soap, wax, sugar and wines, and particularly in fur goods and fur wares (imported). Vyatka was founded in 1615 by the Novgorodians, as Khlynov. In 1591 it was plundered by the Tartars, and again in 1677. Moscow annexed Khlynov in 1489. It received the name of Vyatka in 1780.

**VYENSYI-VOLOCHOK**, a town of Russia, in the government of Smolensk, 109 m. by rail E.N.E. of the town of Smolensk. Pop. 15,676. It was a populous place as early as the 11th century, and carried on a lively trade with Narva on the Gulf of Finland. In the 15th century it fell under the dominion of Lithuania, but was retaken by Moscow, which retained it again in 1611, and kept it till the peace of 1634. It is now an important centre for trade. It has a cathedral, dating from 1596.

**VYERNYI** (formerly *ALMATY*), a town and fort of Asiatic Russia, capital of the province of Semireychensk, 50 m. N. of Lake Issyk-kul, at the northern foot of the Trans-Ili Ala-tau Mountains, at an altitude of 2440 ft. Pop. 24,708. Founded in 1834, it is well-built, provided with boulevards and surrounded by luxuriant gardens. It has a cathedral, being an archiepiscopal see of the Orthodox Greek Church, a school of gardening and horticulture, a public library, and a few distilleries, tanneries and oil works. Situated at the intersection of two roads—from Kulja to Tashkent, and from Semipalatinsk to Kashgar—Vyernyi carries on an active trade in wheat, rice, corn, tea, oil and tobacco. It was the centre of a remarkable earthquake on the 9th of June 1857.

**VYRNYWY** (*Fyrnuiy*), an artificial lake or reservoir in the northwest of Montgomeryshire, N. Wales, constructed for the Liverpool water-supply. It was formed by damming the river Fyrenyw, which runs through Montgomeryshire and joins the Severn and its tributaries, Vyrnwy and Hafren, and is in the basin of the Severn above Shrewsbury, and is in length 12 miles, and in breadth 11. In the lake are the remains of the old town of Vyrnwy, and there is a ferry to the growing settlement of Whitchurch.
W—WAAGEN, G. F.

W

The twenty-third letter of the English alphabet, shows its origin in its name; but it is also V, and, as the name shows, V had the vowel value of u, while the "double u" was employed for the consonant value. In German the same symbol w is called Vei, because in that language it has the value of the English v, while the German v (Vow, few in pronunciation) is used with the same value as f. In the English of the 9th century the w of the old texts (and the w of the Northern) was found not to represent the English w satisfactorily, and a symbol j was adopted from the Runic alphabet. This survived sporadically as late as the end of the 13th century, but long before that had been generally again replaced by uw (w only in Early Middle English) and by w. For u the earliest English printers had a type, but French printers had not; hence a book like the Roman Catholic version of the New Testament printed at Rheims in 1582 prints w with two v's set side by side. Throughout the history of English the sound seems to have remained the same—the consonantal w. For this value as well as for v Latin always used only v; not Greek, except in a few dialects, the consonantal value was early lost (see under F). W is produced by leaving a very small opening between the slightly protruded lips while the back of the tongue is raised towards the soft palate and the nasal passage closed. The ordinary w is voiced, but according to some authorities the w in the combination wh (really hv) is not, in when, what, &c., even when the h is no longer audible. The combination Wh (hw) represents the Indo-European qh when changed according to Grimm's law from a stop to a spirant. Thus what corresponds philologically to the Latin quod and the first syllable of the Greek word. The sound qh in Southern English has now been generally dropped. In Scotland, along the line of former contact with Gaelic, it changes into f: file=while, forl=whorl; but before l (ee) it remains in wheel. In Early English w appeared not only before r as in write, but also before l as in whip (lisp). In write, wring, &c., the w is now silent, though dialectically, e.g. in Abercrombianshire, it has changed to v and is still pronounced, vreat, vring, &c. In English and in other languages there is considerable difficulty in pronouncing w before long u sounds: hence it has disappeared in pronunciation in two (du), but survives in Scottish two, though otherwise the difficulty is more noticeable in Scottish dialects than in literary English, as in "oo=wool and in the Scottish pronunciation of English words like wood as 'wood'.

(P. G.)

WA, a wild tribe inhabiting the north-east frontier of Upper Burma. Their country lies to the east of the Northern Shan States, between the Salween river and the state of Keng-Tung, extending for about 100 m. along the Salween and for considerably less than half that distance inland to the watershed between that river and the Mekong. The boundaries may be roughly said to be the Salween on the W., the ridge over the Namting valley on the N., the hills E. of the Nam Hka on the eastern and southern sides, while the country ends in a point formed by the junction of the Nam Hka with the Salween. The Wa claim to have inhabited the country where they now are since the beginning of time; but it appears more probable that they were the aborigines of the greater part of northern Siam at least, if not of Indo-China, since old records and travellers (e.g. Captain McLeod in 1837) speak of their having been the original inhabitants with small communities left behind from Keng Tung down to Chiangmai; while the state of Keng Tung, just S. E. of the Wa country, has still scattered villages of Wa and traditions that they were once spread all over the country. Their fortified villages sites too are still to be found covered over with jungle. The people are short and dark featured, with negligent features, and some believe that they are allied to the Andamanese and the Selangus inhabiting the islands of the Mergui archipelago, who have been driven back, or retreated, northwards to the wild country they now inhabit; but their language proves them to belong to the Môn-Khmer family. They are popularly divided into Wild Was and Tame Was. The Wild Was are remarkable as the best authenticated instance of head-hunters in the British Empire. They were formerly supposed to be also cannibals; but it is now known that they are not habitual cannibals, though it is possible that human flesh may be eaten as a religious function at the annual harvest feast. Their head-hunting habits have an animistic basis. In the opinion of the Wa the ghost of a dead man goes with his skull and hangs about its neighbourhood, and so many skulls posted up outside his village gate mean so many watch-dog umbrae attached to the village, jealous of their own preserves and intolerant of interlopers from the invisible world. Thus every addition to the collection of skulls is an additional safeguard against ill-affected demons, and a head-hunting expedition is not undertaken, as was once thought, from motives of cannibalism or revenge, but solely to secure the very latest thing in charms as a protection against the powers of darkness. Outside every village is an avenue of human skulls, amid groves conspicuous from long distances. These consist of strips of the primeval jungle, huge forest trees left standing where all the remaining country is cleared for cultivation. The undergrowth is usually cut away, and these avenues are commonly but not always in deep shade. Along one side (which side apparently does not matter) is a line of posts with skulls fitted into niches facing towards the path. The niche is cut sometimes in front, sometimes in the back of the post. In the latter case there is a round hole in front, through which sometimes only the teeth and empty eye-sockets, sometimes the whole skull, grins a ghastly smile. Most villages count their heads by tens or twenties, but some of them have hundreds, especially when the grove lies between several large villages, who combine or run their collections into one another. The largest known avenue is that between Hsung Ramang and Hsan Htung. Here there must be a couple of hundred or more skulls; but it is not certain that even this is the largest. It is thought necessary to add some skulls to this pathway every year if the crops are to be good. The heads of distinguished and pious men and of strangers are the most efficacious. The head-hunting season lasts through March and April, and it is when the Wa hill fields are being got ready for planting that the roads in the vicinity become dangerous to the neighbouring Shans. The little that is known of the practice seems to hint at the fact that the victim selected was primarily a harvest victim. A Wild Wa village is a very formidable place to attack, except for civilized weapons of offence. All the villages are perched high up on the slope of the hills, usually on a knoll or spine-like spur, or on a narrow ravine near the crest of the ridge. The only entrance is through a long tunnel. There is sometimes only one, though usually there are two, at opposite sides of the village. This tunnelled way is a few inches over 5 ft. high and not quite so wide, so that two persons cannot pass freely in it, and it sometimes winds slightly, so that a gun cannot be fired up it; moreover, the path is frequently studded with pegs in a sort of dice arrangement, to prevent a rush. None of the tunnels is less than 30 yds. long, and some are as much as 100 yds. Round each village is carried an earthen rampart, 6 to 8 ft. high and as many thick, and this is overgrown with a dense covering of shrubs, thin bushes and cactuses, so as to be quite impenetrable. Outside this is a deep ditch which would effectually stop a rush. These preparations indicate the character of the inhabitants, which is so savage and suspicious that the Wa country is still unadministered and naturally does not appear in the 1901 census returns. The total number of the Wa race is estimated at more than 50,000.

WAAGEN, GUSTAV FRIEDRICH (1704-1868). German, art historian, was born in Hamburg, the son of a painter and nephew of the poet Ludwig Tieck. Having passed through the college
of Hirschberg, he volunteered for service in the Napoleonic campaign of 1813-1814, and on his return attended the lectures at Breslau University. He devoted himself to the study of art, which he pursued in the great European galleries, first in Germany, then in Holland and Italy. A pamphlet on the brothers Van Eyck led to his appointment to the directorship of the newly founded Berlin Museum in 1832. The result of a journey to London and Paris was an important publication in three volumes, *Kunstwerke und Künstler in England und Paris* (Berlin, 1837-1839), which became the basis for his more important *The Treasures of Art in Great Britain* (London, 1854 and 1857). In 1844 he was appointed professor of art history at the Berlin University. In 1851 he was elected to St. Patrick's as advisor, in the arranging and naming of the pictures in the imperial collection. On his return he published a book on the Hermite collection (Munich, 1864). Among his other publications are some essays on Rubens, Mantegna and Signorelli; *Kunstwerke und Künstler in Deutschland und die vornehmensten Kunstdenkmäler in Wien*. He died on a visit to Copenhagen in 1868. In the light of more recent research his writings are not of much value as regards trustworthy criticism, though they are useful as catalogues of art treasures in private collections at the time when the art market was in its infancy. He greatly respected articles on art and science in the *Handbuch der Mineralogie* and the *Palaeontologie Indica*, and was appointed palaeontologist in 1874, but was obliged to retire through ill-health in 1875. He published important monographs in *Palaontologia Indica* on the palaeontology of Cutch (1875-1876) and the Salt Range (1879-1883), dealing in the latter work with fossils from the Lower Cambrian to the Trias. In 1879 he was appointed professor of mineralogy and geology in the German technical high school at Prague, and he became a contributor to the continuation of Barrande's great work on the *Systeme Stiirien de Bohème*. In 1881 he became professor of palaeontology at the university of Vienne, and in 1889 the Lyceum medal was awarded to him by the Geological Society of London. He died in Vienna on the 24th of March 1900.

**WABASH, a city and the county-seat of Wabash county, Indiana, U.S.A., about 42 m. S.W. of Fort Wayne. Pop. (1890) 5105, (1900) 8618, of whom 498 were foreign-born and 134 negroes; (1910 U.S. census) 8687. It is served by the Cleveland, Cincinnati, Chicago & St. Louis railway (which has extensive shops here), by the Wabash railway, and by interurban electric lines. It has a public library, a Memorial Hall (1897), erected to the memory of Federal soldiers in the Civil War and occupied by the local "camp" of the Grand Army of the Republic, a Masonic temple, a county hospital and two parks. The city is in a fertile agricultural region, and has a considerable trade in grain and produce. Among its manufactures are furniture, agricultural implements and foundry and machine-shop products. In 1905 the factory products were valued at $2,202,032 (31.2% more than in 1900). Wabash was settled about 1834, incorporated as a village in 1854, and first chartered as a city in 1860. It was one of the first cities in the western body, lighted with electricity, a lighting plant being established, in February 1880.**

**WACE, HENRY (1836- ), English divine, was born in London on the 10th of December 1836, and educated at Marlborough, Rugby, King's College, London, and Brasenose College, Oxford. He was ordained in the Church of England in 1861, and held various curacies in London, being chaplain at Lincoln's Inn in 1872 and preacher in 1880. From 1875 to 1880 he was prominently connected with King's College, London, where he was professor of ecclesiastical history, and subsequently (1883) principal. Both as preacher and writer Dr. Wace, who took his D.D. degree in 1884, became conspicuous in the theological world. He was Boyle lecturer in 1874 and 1875, and Bampton lecturer in 1879; and besides publishing several volumes of sermons, he was co-editor of the *Dictionary of Christian Biography* (1877-1887), and editor of *The Speaker's Commentary on the Apocalypse*. He took a leading part as the champion of historic orthodoxy in the controversies with contemporary Rationalism in all its forms, and firmly upheld the importance of denominational education and of the religious test at King's College; and when the test was abolished in 1902 he resigned his seat on the *Gesta regum* of 1896. In 1888, when he was appointed to a chaplain-in-ordinary to Queen Victoria. When he resigned the principalship of King's College in 1896 he was made rector of St. Michael's, Cornhill; and in 1903 he became dean of Canterbury, in succession to Dr. Farrar.**

**WACE, (? ROBERT (1100?-1175?), Anglo-Norman chronicler, was born in Jersey. He studied at Caen; he became personally known to Henry I, Henry II, and the latter's eldest son, Prince Henry; from Henry II. he received a prebend at Bayeux and other benefices. He became a great bibliophile and art critic. He is the author of two metrical chronicles in the Norman-French language. Of these the earlier in date is the *Roman de Brut*, completed in 1155, which is said to have been dedicated to Eleanor of Aquitaine (ed. A. J. V. Le Roux de Lincy, 2 vols., Rouen, 1836-1838). This is a free version of the *Latin Historia Brittonum* by Geoffrey of Monmouth, in rhyming octosyllables; it was rendered into English, shortly after 1200, by Layamon, a mass-priest of Worcestershire, and is also largely used in the rhymed English chronicle of Robert Mannyng. Wace's second work, the *Roman de la Rose*, written between 1160 and 1174, has a less fabulous character than the *Brut*, being a chronicle of the Norman dukes from Rollo to Robert Curthose. It has been ably dissected by Gustav Körting (über die Quellen des Roman de Rou, Leipzig, 1867), who shows that it is mainly based upon Dudo and William of Jumièges. There is also reason for thinking that Wace used the *Gesta regum* of William of Malmesbury. Where Wace follows no ascertainable source he must be used with caution. Undoubtedly he used oral tradition; but he also seems to have given free play to his imagination.**

**The Roman de Rou is written in rhyming octosyllables, varied by assonances, and by the use of alexandrines. It has been edited by F. Plumier (supplement, Rouen, 1827-1829) and more completely by H. Andrusen (2 vols., Heilborn, 1877-1879).**

**WACHSMUTH, CHARLES (1829-1899), American palaeontologist, was born in Hanover, Germany, on the 13th of September 1829. Educated as a lawyer in his native city, he abandoned the profession on account of ill-health, and in 1852 went to New York as agent for a Hamburg shipping house. Two years later, for reasons of health, he removed to Burlington, Iowa, U.S.A., where he settled. Here he was attracted by the fossils, and especially the crinoids, of the Burlington Limestone, and in a few years possessed a fine collection. In 1864 he made acquaintance with L. Agassiz, and in the following year paid a visit to Europe, where he studied the crinoids in the British Museum and other famous collections. He now decided to devote all his energies to the elucidation of the crinoids, and with signal success. He made further extensive collections, and supplied specimens to the Agassiz museum at Cambridge, U.S.A., and the British Museum. Becoming acquainted with Frank Springer (1848-1921), a lawyer at Burlington, he stirred up his enthusiasm for the subject, and together they began their study of the crinoids and published a series of important papers. These include "Discovery of the Ventral Structure of Taxocrinus and Haplocrinus, and Consequent Modifications in the Classification of the Crinoida" (*Proc. Acad. Nat. Sci., Philadelphia, 1889); "The Perisome Plates of the Crinoids" (*Ibid., 1891); and a monograph on "The North American Ctenoidea Camera", published, after the death of Wachsmuth, in the *Memoirs of the Museum of Comparative Zoology* at Harvard (1897). Of this last-named work a detailed**
review and analysis was published by F. A. Bather, of the British Museum, in the *Geol. Mag.* for 1808-1809. Wachamuth died on the 7th of February 1809.

Obituary (with portrait) by F. A. Bather, *Geol. Mag.* (April 1809).

**WACO,** a city and the county-seat of McLennan county, Texas. It is in the centre of the state, on both banks of the Brazos river, about 100 m. S. by W. of Dallas. Pop. (1890) 14,445; (1900) 26,886, of whom 8,286 were negroes; (1910 census) 26,425. Waco is served by the Missouri, Kansas & Texas, and by other railways. Waco is the seat of Baylor University (co-educational) and of the Texas Christian University (Christian; co-educational). Baylor University was founded in 1845, and was consolidated in 1886 with Waco University (Baptist, 1861, founded by Dr Rufus C. Burleson, a former president of Baylor University). It was named in honour of Robert E. B. Baylor (1793-1874), a representative in Congress from Alabama in 1830-1831, and one of its founders. In 1898-1900 it had 40 instructors and 1,265 students (666 women), of whom 647 were in the college. The Texas Christian University was founded in 1873 at Thorp's Springs as a private school, chartered as Add Ran College, transferred to the Christian Churches of Texas in 1880, and removed to Waco in 1885. Its present name was adopted in 1902, the name Add Ran College being retained for the college of arts and sciences. In 1908-1909 the university had 26 instructors and 793 students (279 in the college of arts and sciences). It is situated south of the Brazos river, in the farming region. In 1905 the factory products were valued at $2,970,800. The city was named after the Waco (or Huaco) Indians (Caddoan stock), who had a large village here until 1839, when they were nearly exterminated by the Cherokee; in 1853 they removed to a reservation, and after 1890 became incorporated with the Wichita. The first white settlement was made in 1849. Waco was incorporated as a town in 1856; in 1909 the administration was entrusted to a mayor and four commissioners.

**WAD,** a black, earthy mineral consisting mainly of hydrated manganese chloride of importance at Wadi Halfa. When pure in substance, it varies considerably in chemical composition, and contains different impurities often in large amount. A variety containing much cobalt oxide is called "ashbolite," while "lampadite" is a cupriferous variety. It is very soft, readily soluble in the fingers, and may be considered as an earthy form of psammolene (q.v.). It results from the decomposition of other manganese minerals, and is often deposited in marls ("bog manganese") or by springs. The name wad is of uncertain origin, and has been applied also to graphite. (L.S.)

**WADAI,** a country of north central Africa, bounded N. by Darfur, E. by Ushai, S. by Darfur, W.S.W. by Kanem and Bagirmi, and E. by Darfur. Formerly an independent Mahommedan sultanate, it was in 1900 annexed to French Equatorial Africa (French Congo). Wadai has an area estimated at 1,500,000 sq. m., and a population of 3,000,000 to 4,000,000.

The general level of the country is about 1,000 ft. North, north-east, south-west and in the centre are ranges of hills rising another 1,000 ft. West and north-west the fall to the Saharan is gradual. Here occur remarkable sand-ridges of fantastic shape—hollow mounds, pyramids, cresses, &c.—which are characteristic of the Libyan desert. The desert is one of vast extent—red, light grey, black, &c.—presenting the aspect of ruined castles, ramparts and churches. North-west is a wide district of dreary plain—part of the clay zone which stretches from the middle Niger to the Nile—covered with thorn bush and dun palms. The central and eastern regions are the most fertile, and contain large forest areas. The country belongs to the Chad drainage area, though it is possible that the Bahar-el-Ghazal (of the Chad system) may afford a connection. This part of the Chad basin is separated from the north-eastern districts, of which the Batha (over 300 m. long) is the largest, flow west, the Batha ending in a depression, some 200 m. in the Chari. Near N'Djamena, the Wadai stream has a more northerly course than the Batha, goes in the direction of Chad, but ends in swamps in the clayey soil. These rivers are intermittent, and after seasons of drought Fitti is completely dry. In 1870 a French mission (M. Murra, and E. de Sauzay) ascended the rivers. The rivers of Dar Runga flow westward towards the Shari, but, save the Bahr Salamat, none reaches it. They only contain water in the rainy season. About 100 m. above the Salamat-Shari confluence is Lake Lopém, which gives water to the Salamat by a short channel. In the forests are large herds of elephants, and hippopotami abound along the river-beds. In the north are the camel and the ostrich. Among the trees is a species of wild coffee which reaches 50 to 60 ft. and yields berries of excellent quality. The cotton plant is indigenous.

**Inhabitants and Trade.**—The inhabitants consist of negro and negro tribes, Arabs, Fula, Tibi and half-castes. The Maba, the dominant race, are said to be of Nubian origin; they are believed not to number more than 75,000, and live chiefly in the north-eastern district. They are in political alliance with the Arab tribes, known in Wadai as Zoruk (dark) and Homr (red). The Maba have a reputation for pride, valour, cruelty, drunkenness and barbaric splendour.

The capital, Abeshir, is in the N.E., in about 21° E., 13° 50′ N. Thence a caravan route crosses the Sahara via the Kufa oases to Benghazi in Barca. Another trade route goes east through Darfur to Khartum. The people possess large numbers of horses, cattle, sheep and goats. Maize, durra, cotton and indigo are cultivated, and cloth is woven. Ivory and ostrich feathers, the chief articles of export, are taken to Tripoli by the desert route, together with small quantities of coffee and other produce. There is a trade in cattle, horses and coffee with the countries to the south. Until the French conquest Wadai was a great centre of the slave trade. Slaves were obtained by raiding and in the form of tribute from Bagirmi, Kanem and other countries once dependent on Wadai. The slaves were sent chiefly to Barca. Wadai was also notorious for its traffic in eunuchs.

**History.**—Situated between the Sahara and the dense forest lands of equatorial Africa, the country Wadai, named after a city of that region, was the scene of one of the most remarkable and romantic adventures of the Christian faith. The country was an important source of African slaves. The Holy Roman Empire sent an expedition, led by Count Wacza, to win back the African slave trade from the hands of the Moors. The expedition was successful, and Wadai was taken by force. The Moors were forced to surrender and were compelled to give up the slave trade. The expedition was supervised by the Roman Catholic Church, and was undertaken with the approval of the Pope. The expedition was successful, and Wadai was taken by force. The Moors were forced to surrender and were compelled to give up the slave trade. The expedition was supervised by the Roman Catholic Church, and was undertaken with the approval of the Pope. The expedition was successful, and Wadai was taken by force. The Moors were forced to surrender and were compelled to give up the slave trade. The expedition was supervised by the Roman Catholic Church, and was undertaken with the approval of the Pope. The expedition was successful, and Wadai was taken by force. The Moors were forced to surrender and were compelled to give up the slave trade.
1909 Captain Fiegenschuh, with a small force of tirailleurs, and Acyl's contingents, advanced up the Batba to a place within 15 m. of Abeshr, where, on the 1st of June, the enemy were defeated. The next day another fight took place close to Abeshr. The Wadadans were again put to flight and the town bombarded with cannon. Doud Murra with a small following fled north, and Abeshr was occupied by the French. The prince Acyl was subsequently placed on the throne, and, under French guidance, governed Wadai proper, Dar Sila, Dar Runga and other tributary states being directly governed by French residents.

The war was not, however, ended by the occupation of Abeshr. Captain Fiegenschuh's column, operating south-east of Abeshr, was cut off by the Massalit Arabs near the Darfur frontier, but a punitive force retrieved this disaster in April following. While these operations were in progress, Liet. Boyd Alexander (b. 1873), who had previously crossed from the Niger to the Nile, the first British explorer to enter Wadai, passed through Abeshr on his way to Darfur. At the station of Nyeri, in the Tana, on the Darfur border, he was murdered on the 2nd of April 1910.

In November 1910 a French column, 350 strong, under Colonel Moll, while operating in the Massalit country was attacked by 5000 men under Doud Murra and the sultan of the Massalit. The enemy was beaten off, but the French column had over 100 casualties, including Colonel Moll killed.

WADDINGTON, WILLIAM HENRY (1826-1894), French statesman, was born at St. Remi-sur-l'Avre (Eure-et-Loir) on the 11th of December 1826. He was the son of a wealthy Englishman who had established a large spinning factory in France and had been naturalized as a French subject. After receiving his early education in Paris, he was sent to Rugby, and thence proceeded to Trinity College, Cambridge, where he was second classic and chancellor's medallist, and roved for the university in the winning boat against Oxford. Returning to France, he devoted himself for some years to archaeological research. He undertook travels in Asia Minor, Greece and Syria, the fruits of which were published in two Mémoires, crowned by the Institut, and in his Mélanges de numismatique et de philologie (1861). Except his essay on "The Protestant Church in France," published in 1856 in Cambridge Essays, his remaining works are likewise archaeological. They include the Fasts de l'empire romain, and editions of Diocletian's edict and of Philippe Lebas's Voyage archéologique (1858-1877). He was elected in 1865 a member of the Académie des Inscriptions et Belles-Lettres.

After standing unsuccessfully for the department of the Aisne in 1865 and 1869, Waddington was returned by that constituency at the election of 1871. He was minister of public instruction in the short-lived cabinet of the 10th of May 1873, and in 1876, having been elected senator for the Aisne, he was again entrusted by Dufaure with the ministry of public instruction, with which, as a Protestant, he was not permitted to combine the ministry of public worship. His most important project, a bill transferring the conferment of degrees to the state, passed the Chamber, but was thrown out by the Senate. He continued to hold his office under Jules Simon, with whom he was overthrown on the famous seize mai 1877. The triumph of the republicans at the general election brought him back to power in the following December as minister of foreign affairs under Dufaure. It was the use of the French plenipotentiaries at the Berlin Congress. The cession of Cyprus to Great Britain was at first denounced by the French newspapers as a great blow to his diplomacy, but he obtained, in a conversation with Lord Salisbury, a promise that Great Britain in return would allow France a free hand in Tunisia.

Early in 1879 Waddington succeeded Dufaure as prime minister. Holding office by suffrages of Gambetta, he halted in an undetermined attitude between the radicals and the reactionaries, until delay of urgent reforms lost him the support of all parties. He was forced on the 27th of December to retire from office. He refused the offer of the London embassy, and in 1880 was reporter of the committee on the adoption of the scrutin de liste at elections, on which he delivered an adverse judgment. In 1883 he accepted the London embassy, which he continued to hold till 1893, showing an exceptional tenacity in defence of his country's interests. He died on the 23rd of January 1894. His wife, an American lady, whose maiden name was Mary A. King, wrote some interesting recollections of their diplomatic experiences—Letters of a Diplomatist's Wife, 1863-1900 (New York, 1903), and Italian Letters (London, 1905).

WADE, BENJAMIN FRANKLIN (1800-1878), American statesman, was born near Springfield, Massachusetts, on the 27th of October 1800, of Puritan ancestry. He was reared on a farm, receiving little systematic education, and in 1821 he removed with his family to Andover, in the Western Reserve of Ohio. Here he spent two more years on a farm, and then, securing employment as a drover, worked his way to Philadelphia and finally to Albany, New York, where for two years he taught school, studied medicine, and was a labourer on the Erie Canal. Returning to Ohio in 1825, he studied law at Canfield; was admitted to the bar in 1827, and began practice at Jefferson, Ashtabula county, where from 1831 to 1837 he was a law partner of Joshua R. Giddings, the anti-slavery leader. During 1837-1839 and 1841-1843 he was a Whig member of the Ohio State Senate. From 1847 until 1851 he was a state district judge, and from 1851 until 1869 was a member of the United States Senate, first as an anti-slavery Whig and later as a Republican. In the Senate Wade was from the first an uncompromising opponent of slavery, his bitter denunciations of that institution and the slaveholders receiving added force from his rugged honesty and sincerity. His blunt, direct style of oratory and his somewhat rough manners were characteristic. After the outbreak of the Civil War he was one of the most vigorous critics of the Lincoln administration, whose Ohio member, Salmon P. Chase, had long been a political rival. He advocated the immediate emancipation and arming of the slaves, the execution of prominent Southern leaders, and the wholesale confiscation of Confederate property. During 1861-1862 he was chairman of the important joint-committee on the conduct of the war, and in 1862, as chairman of the Senate Committee on Territories, was instrumental in abolishing slavery in the Federal Territories. In 1864, with H. W. Davis (q.v.), he secured the passage of the Wade-Davis Bill (for the reconstruction of the Southern States), the fundamental principle of which was that reconstruction was to be legislative, not an executive, problem. This bill was passed by both houses of Congress, just before their adjournment, but President Lincoln withheld his signature, and on the 9th of July issued his famous Proclamation, nullifying his position. Soon afterward (Aug. 9) Wade and Davis published in the New York Tribune the famous "Wade-Davis Manifesto," a vituperative document impugning the President's honesty of
WADE, G.—WADE, SIR T. F.

WADE, THOMAS (1805-1879), English poet and dramatist, was born at Woodbridge, Suffolk, in 1805. He early went to Italy, where he began to publish verse of considerable merit under the inspiration of Byron, Keats and especially Shelley. He wrote some plays that were produced on the London stage with a certain measure of success, owing more perhaps to the acting of Charles and Fanny Kemble than to the merits of the dramatist. Wade frequently contributed verses to the magazines, and for some years he was editor as well as part-proprietor of Bell's Weekly Messenger. This venture proving financially unsuccessful, he retired to Jersey, where he edited the British Press, continuing to publish poetry from time to time until 1871. He died in Jersey on the 15th of September 1875. His wife was Lucy Eleanor, a musician of some reputation.

The most notable of Wade's publications were Tasso and the Sisters (1829), a volume of poems, among which "The Nuptials of Juno" in particular showed rare gifts of imagination, though like all Wade's work deficient in sense of melody and feeling for artistic form; Woman's Love (1828), a play produced at Covent Garden; The Phenomenologists, a farce produced at Covent Garden in 1830; The Jew of Arragon, a play that was "howled from the stage" at Covent Garden in 1830 owing to the hostility of the Jews; Nandi et cordis carmina (1835), a volume of poems, many of which had previously appeared in the Monthly Repository; The Contention of Death and Victory and The Great Uxury, another three being published in the form of pamphlets in 1837; Prodomi veterum (1839). Wade also wrote a drama entitled King Henry II., and a translation of Dante's "Inferno" in the metre of the original, both with much labour in ms., and a series of sonnets inspired by his wife, some of which have been published.

WADE, SIR THOMAS FRANCIS (1818-1895). British diplomat, born in London on the 25th of August 1818, was the son of Major Wade of the Black Watch, by his wife Anne, daughter of William Smythe of Barbavilla, Westmeath. In 1838 his father purchased for him a commission in the 81st Regiment. Exchanging (1839) into the 42nd Highlanders, he served with his regiment in the Ionian Islands, devoting his leisure to the congenial study of Italian and modern Greek. On receiving his commission as lieutenant in 1841 he exchanged into the 98th Regiment, then under orders for China, and landed in Hong-Kong in June 1842. The scene of the war had at that time been transferred to the Yangtze-kiang, and thither Wade was ordered with his regiment. There he met with a severe check, in the land forces in the successful "conjectural" military and naval expedition to Vigo. In 1724 he was sent to the Highlands to make a thorough investigation of the country and its people, and two years later, having meantime been appointed commander-in-chief to give effect to his own recommendations, he began the system of wooded roads which is his chief title to fame, and is commemorated in the lines—

"Had you seen these roads before they were made,
You would lift up your hands and bless General Wade."

In the course of this engineering work Wade superintended the construction of no less than 40 stone bridges. At the same time, slowly and with the tact that came of long experience, he disarmed the clans. In 1742 he was made a privy councillor and lieutenant-general of the ordnance, and in 1743 field marshal. In this year he commanded the British contingent in Flanders, and was associated in the supreme command with the duke d'Arenberg, the leader of the Austrian contingent. The campaign, as was to be expected when the enemy was of one nation, superior in numbers and led by Saxe, was a failure, and Wade, who had been very ill at this period, resigned the command in March 1744. George II. promptly made him commander-in-chief in England, and in that capacity Field Marshal Wade had to deal with the Jacobite insurrection of 1745, in which he was utterly baffled by the perplexing rapidity of Prince Charles Edward's marches. On the appointment of the duke of Cumberland as commander-in-chief of the forces, Wade retired. He died on the 14th of March 1748.
Mr. Loch and others was by an act of shameless treachery made prisoner. In the succeeding negotiations Wade took a leading part, and on the establishment of the legation at Peking he took up the post of Chinese secretary of legation. In 1862 he was made a Companion of the Bath. On the return of Sir Frederick Bruce to England in 1864 he remained as chargé d'affaires, and again from 1869 to 1871, when he was appointed minister, he filled the acting post. The Tientsin massacre in 1870 entitled long and difficult negotiations, which were admirably conducted by Wade. On the assumption of power by the emperor T'ung-chih he, in common with his colleagues, requested an audience in accordance with the treaties, which was for the first time granted as a right. The murder of A. R. Margary near Man-wyne in Yunnan in 1871 threatened at one time to cause a rupture with the Chinese government, and as a matter of fact Wade did leave Peking. But the Chinese, finding that he was in earnest, despatched Li Hung-Chang after him to Chefoo, where the two diplomats arranged the penalties which were to be paid for the crime, and concluded a convention which, after a considerable interval, was ratified by the governments. Wade was then made K.C.B., and in 1883 retired from the service. On his return to England the attractions of his old university induced him to take up his residence at Cambridge, where he was appointed the first professor of Chinese. He died there on the 31st of July 1893. In 1880 he was made G.C.M.G. In 1886 he had married Amelia, daughter of Mr. K. Dewar.

WADE (or WADD), SIR WILLIAM (1546–1623), English statesman and diplomatist, was the eldest son of Armagn Wade (d. 1568), the traveller, who sailed with a party of adventurers for North America in 1536, and later became (1547) one of the clerks of the privy council in London and a member of parliament. William Wade obtained his entrance into official life by serving William Cecil, Lord Burghley, sending information to this statesman from Paris and from Italy. He also passed some time in Strassburg; then in 1581 he became secretary to Sir Francis Walsingham and in 1583 a clerk of the privy council. He visited Vienna, Copenhagen and Madrid on public business, and in 1585 he went to Paris, being waylaid and maltreated on his return near Amiens by influential personages who disliked the object of his mission. In 1586 he went to Charlestown and took possession of Mary Stuart’s papers, and in 1587 was again in France. During the remainder of Elizabeth’s reign Wade was much occupied in searching for Jesuits and in discovering plots against the life of the queen. James I., who knighted him in 1603, employed him in similar ways, and he was fully occupied in unravelling the plots which marked the early years of the new reign. For some time Wade was a member of parliament. He retired from public life in 1613, and died on the 21st of October 1623. Sir William was a shareholder in the Virginia company, and the Wades of Virginia claim descent from his father.

WADEBRIDGE, a market town and seaport in the St Austell parliamentary division of Cornwall, England, on the Great Western and London & South-Western railways, 38 m. W.N.W. of Plymouth. Pop. of urban district (1901), 2186. It is picturesquely situated at the head of the estuary of the river Camel, 7 m. from its mouth in Padstow Bay on the north coast. A stone bridge, consisting of seventeen arches, was built in 1495 over the river, and made a county bridge under James I. The parish church of Egloskayle, nearly 2 m. from the town, is in the main Perpendicular, with a beautiful tower; but part of the fabric is Early English. The neighbouring church of St Breock is Decorated and Perpendicular, with a fine font of the earlier period. An ancient round-headed cross stands near the town. There is considerable agricultural trade, and iron founding is carried on; while in the neighbourhood some copper, lead, granite and slate are worked and exported in small vessels; coal, timber and general merchandise being imported.

WADALAI, a station on the east bank of the Upper Nile in the British protectorate of Uganda, in 2° 50’ N., 31° 35’ E., 200 m. in a direct line N.N.W. of Entebbe on Victoria Nyanza, and 72 m. by river below Butiaba on Albert Nyanza. The government station was built on a hill 160 to 200 ft. above the Nile at a spot where the river narrows to 482 ft. and attains a depth of 30 ft. At this place it was a gauge for measuring the discharge of the river. Wadelai was first visited by a European, Liett. H. Chipendale, in 1875, and was named after a chiefman who, when visited by Gesi Pasha (on the occasion of that officer’s circumnavigation of Albert Nyanza), ruled the surrounding district as a vassal of Kabarega, king of Unyoro. The region was annexed to the Egyptian Sudan and Wadelai’s village chosen as a government post. This post was on the western bank of the Nile, 14 m. below the existing station. Here for some time Emin Pasha had his headquarters, evacuating the place in December 1882. Thereafter, for some years, the district was held by the Mahdists. In 1894 the British flag was hoisted at Wadelai, on both banks of the Nile, by Major E. R. Owen. Some twelve years later the government post was withdrawn. There is a native village at the foot of the hill.

WADHWA, a town of India, in Kathiawar, Bombay, the capital of a petty state of the same name, and the junction of the Kathiawar railway system with the Bombay and Baroda line, 389 m. N. of Bombay. Pop. (1901) 16,223. It has considerable trade and manufactures. There is a school for giriasias or subordinate chiefs. The civil station, under British administration, had a population in 1901 of 11,255. The state of Wadhw is an area of 236 sq. m.; pop. (1901), 34,857; revenue, £25,000. Cotton trade and stone-quarrying are important, and there are the manufactures of soap and saddlery.

WADI, also written waddy, in some dialects wads; Arabic for a "valley," hence a stream or river flowing through a valley, as well as the valley itself. It is a common term in place names.

WADI HALFA, or HALFA, a town of the Anglo-Egyptian Sudan, in 21° 35’ N., 33° 10’ E., on the right bank of the Nile, 5 m. S. of the northern frontier of the Sudan. It is the chief town of the Halfa mudiria, is 770 m. S. of Cairo by rail and steamer, and 575 m. N.N.W. of Khartum by rail. Some 6 m. above the town is the second cataract, and on the west bank of the Nile opposite Halfa are the ruins of the ancient Egyptian city of Buhen (Bohon). Halfa is the northern terminus of the Sudan railway and the southern terminus of a steamboat service on the Nile, which, running to Shellal (Assuan), connects there with the Egyptian railways.

Wadi Halfa is a general designation including the native village of that name, the camp, founded by the British in 1884 as their base in the operations for the relief of General Gordon, and the civil cantonment established at the same time. This cantonment occupies the site of a Nubian village, and round it has grown a thriving town, at first named Taufikia, but now called Halfa. It has a population (1907) of about 3000. The camp is 1½ m. S. of Halfa. Here are the barracks, officers’ quarters, railway works, and an esplanade along the river front. The village of Wadi Halfa is 3 m. S. of the camp.

WAD MEDANI, a town of the Anglo-Egyptian Sudan, capital of the Blue Nile mudiria, in 14° 24’ N., 33° 31’ E., on the left bank of the Blue Nile, 110 m. by rail and 147 m. by river, S.E. of Khartum. Pop. about 20,000. It is the chief depot for grain raised in the Gezira, has oil and soap works, and is a thriving commercial centre, being on the main trade route between Khartum and Abyssinia. The town, which is of considerable antiquity, contains some fine buildings, the chief mosque having a conspicuous tower. Wad Medani was almost destroyed during the Mahdia, but its return to prosperity under Anglo-Egyptian rule was rapid. In 1900 it was connected by railway with Khartum, and thus the hindrance to trade through the Blue Nile being scarcely navigable between January and June was overcome. In 1910 railway communication between the town and Khartum was established. (See Sudan, § Anglo-Egyptian.)

WAFFER, a thin flat cake or sheet of paste, usually circular in shape. The derivation of the word, which is the same as "waffle," a battery-cake cooked in waffle-irons and served hot, is given under "Goffer," which is adapted from the French form of the Teutonic original. As articles of stationery, wafers consist of thin brittle, adhesive disks, used for securing papers together, and for forming a basis for impressed official seals. They are
made of a thin paste of very fine flour, baked between "wafer irons" over a charcoal fire till the thin stratum of paste becomes dry and brittle and the flour starch is partly transformed into glutinous starch inextricably mixed with the metal steel punches. Bright non-poisonous colouring matter is added to the paste for making coloured wafers. They are also made of gelatin. Wafers of dry paste are used in medical practice to enclose powders or other forms of drugs, thus rendering them easy to swallow.

In ecclesiastical usage the term "wafer" is applied to the thin circular disk of unleavened bread, stamped with a cross, the letters I.H.S. or the Agnus Dei, which is the form of the consecrated bread as used in the service of the Eucharist by the Roman Catholic Church. WAGERS (derived, through Fr. wager, gagear, from Lat. vadium, a pledge), a bet or stake. Wagers in the ordinary sense of the term are dealt with under the headings GAMING and BETTING; but the method of wagering—in principle the putting of a decision to the hazard—has had extended employment in various cases which may be noticed here. The determination of cases, civil and criminal, by means of wager or analogous forms of procedure, was a characteristic feature of ancient law. The leges actio sacramentii at Rome—at first a real, then a fictitious, wager—and the wagers of battle and of civil cases in England, of the highest antiquity in their origin and in the comparatively late period in the history of both legal systems. The form of the wager survived long after its reason had been forgotten. The general prevalence of the wager form of proceeding is perhaps to be attributed to the external convenience of a judge as a mere referee who decided the dispute submitted to him, not as an executive officer of the state, but as an arbitrator casually called in (see Maine, Ancient Law, c. x.).

"Wager of battle" in England was a mode of trial allowed in certain cases, viz. on a civil writ of right for recovery of land (see supra, p. 237), in which questions arising in the course of chancery proceedings were sent for trial by jury in a common law court. The plaintiff averred the laying of a wager of £5 with the defendant that a certain event was as he alleged; the defendant admitted the wager, but disputed the allegation; on this issue was joined. This procedure was abolished by 19. 19 of the Gaming Act 1845. (W.F.C.)

WAGES (the plural of "wage," from Late Lat. wadium, a pledge, O. Fr. wager, gagear). Wages, although one of the most common and familiar terms in economic science, is at the same time one of the most difficult to be accurately defined. The natural definition is that wages is the "reward for labour," but then we are at once confronted with the difficulty so well stated by Adam Smith: "The greater part of people understand better what is meant by a quantity of a particular commodity than by a quantity of labour; the one is a plain palpable object, the other an abstract notion, which, though it can be made sufficiently intelligible, is not altogether so natural and obvious." If we regard wages as the reward for a quantity of labour, it is clear that to make the meaning precise we must give a precise meaning to this abstract notion of Adam Smith. From the point of view of the labourer the quantity of labour refers not so much to the work accomplished (e.g. raising so many foot-pounds) as to "all the feelings of a disagreeable kind, all the bodily inconvenience or mental annoyance, connected with the employment of one's thoughts or muscles or both in a particular occupation" (J. S. Mill). But this analysis seems only to make the task of definition more difficult, for the class of labourers, in this wide sense of the term labour, would include the capitalist who racks his brains in making plans just as much as the navvy who digs with the sweat of his brow. Thus "profits," in the ordinary sense of the term, instead of being contrasted, would to a large extent be classified with wages, and in fact the wages of superintendence or of management is one of the recognized elements in the classical analysis of profits. It is only when we refer to the list of "occupations" in any civilized country that we can really form an adequate idea of the variety of classes to which the term labour, as defined by Mill, may be extended.

1 The medieval court of chivalry had both civil and criminal jurisdiction, and was held jointly by the lord high constable and the earl marshal. The last sitting of a court of chivalry for criminal business in England was in 1631; and as a civil court (for cases of honour and questions of precedence) it gradually decayed through want of power to enforce its decisions. There is an interesting account of the trials of battle ordered by a court of chivalry in Ashmolean MSS. 856 of the Bodleian Library (transcribed in Illustrations of Ancient State and Chivalry, Roxburghe Club, 1840).

2 See G. Neilson, Trial by Combat (Glasgow, 1891).

ancient constitutional records). The procedure in a wager of law is traced by Blackstone to the Mosaic law, Ex. xxii. 10; but it seems historically to have been derived from the system of compurgation, introduced into England from Normandy, a system which is now thought to have had an appreciable effect on the development of the English jury (q.v.). It also has some points of resemblance, perhaps some historical connexion, with the sponsio and the decisiory oath of Roman law, and the reference to oath of Scots law (see Oath). The use of the oath instead of the real or feigned combat—real in English law, feigned in Roman law—no doubt represents an advance in legal development. The technical term sacramentum is the bond of union between the two stages of law. In the wager of law the defendant, with eleven compurgators, appeared in court, and the defendant swore that he did not owe the debt, or (in detinue) that he did not detain the plaintiff's chattel; while the compurgators swore that they believed that he spoke the truth. It was an eminently unsatisfactory way of arriving at the merits of a claim, and it is therefore not surprising to find that the policy of the law was in favour of its restriction rather than of its extension. Thus it was not permitted where the defendant was not a person of good character, where the king sued, where the defendant was the executor or administrator of the person alleged to have owed the debt, where the oath was in an action to recover a debt, or where the oath was in an action of trust; and even though the cause of action were the same. No wager of law was allowed in assumpsit, even though the cause of action were a simple debt. This led to the general adoption of assumpsit—proceeding originally upon a fictitious averment of a promise by the defendant—as a means of recovering debts. Where a penalty was created by statute, it became a common form to insert a proviso that no wager of law was to be allowed in an action for the penalty. Wager of law was finally abolished in 1833 (3 & 4 William IV. c. 42).

Another form of judicial wager in use up to 1845 was the feigned appeal, a technical appeal which questions arising in the course of chancery proceedings were sent for trial by jury in a common law court. The plaintiff averred the laying of a wager of £5 with the defendant that a certain event was as he alleged; the defendant admitted the wager, but disputed the allegation; on this issue was joined. This procedure was abolished by s. 19 of the Gaming Act 1845. (W.F.C.)
It may be granted that in certain economic inquiries it is extremely useful to bring out the points of resemblance between "workers" at the various stages of the social scale, and it is especially serviceable in showing that the opposition between "employers," is a displacement of the "classe," of and the "masses," is often exaggerated. At the same time the differences, if not in kind at any rate in degree, are so great that if the analogy is carried very far it becomes misleading. Accordingly it seems natural to adopt as the preliminary definition of "wages" something equivalent to that of Francis Walker in his standard work on the Wages Question, viz., "the reward of those who are employed in production with a view to the profit of their employers and are paid at stipulated rates."

It may be observed that by extending the meaning of production, as is now done by most economists, to include all kinds of labour, and by substituting benefit for profit, this definition will include all grades of wages.

Having thus limited the class of those who earn "wages," the next point is to consider the way in which the wages ought to be measured. The most obvious method is to take as the rate of time-wages the amount of money earned in a certain time, and as the rate of task-wages the amount of money obtained for a given amount of work of a given quality; and in many inquiries this rough mode of measurement is sufficient. But the introduction of money as the measure at once makes it necessary to assume that for purposes of comparison the value of the money to the wage-earners may be considered constant. This supposition does not hold good even between different places in the same country at the same time, and still less with variations in time as well as place. To the labourers, however, the amount of money they obtain is only a means to an end, and accordingly economists have drawn a sharp distinction between nominal and real wages. "Labour, like commodities," says Adam Smith, "is may be said to have a real and a nominal price. Its real price may be said to consist in the quantity of the necessaries and conveniences of life which are given for it; its nominal price in the quantity of money. The labourer is rich or poor, is well or ill rewarded, in proportion to the real not to the nominal price of his labour."

Walker (op. cit. pp. 12 sqq.) has given a full analysis of the principal elements which ought to be taken into account in estimating the real wages of labour. They may be classified as follows. (1) Variations in the purchasing power of money may be due in the first place to causes affecting the general level of prices in a country. Such, for example, is the case in the country of the United States, where a good example is furnished in English history in the reigns of Henry VIII. and Edward VI. Thorold Rogers has ascribed much of the degradation of labour which ensued to this fact; and Macaulay has given a graphic account of the evils suffered by the labouring classes prior to the recoinage of 1696. The issues of inconvertible paper notes in excess have frequently caused a disturbance of real wages, and it is generally asserted that in this case wages as a rule do not rise so quickly as commodities. A general rise in prices due to great discoveries of the precious metals would, if nominal wages remained the same, of course cause a fall in real wages. There are, however, good grounds for supposing that the stimulus given to trade in this case would raise wages at least in proportion; and certainly the great gold discoveries in Australia and California raised wages in England, as is shown in Tooke's History of Prices, vol. v. p. 284. Similarly it is possible that a general fall in prices, owing to a relative scarcity of the precious metals, may lower the prices of commodities before it lowers the price of labour, in which case there is a rise in real wages. In the controversy as to the possible advantages of bimetallism this was one of the points most frequently discussed. It is impossible to say a priori whether a rise or fall in general prices, or a change in the value of money, will raise or lower real wages, since the result is effected principally by indirect influences. But, apart from these general movements in prices, we must, in order to find the real value of nominal wages, consider variations in local prices, and in making this estimate we must notice the principal items in the expenditure of the labourers. Much attention has been given recently by statisticians to this subject, with the view of finding a good "index number" for real wages. (2) Varieties in the form of production require an attentive scrutiny. Sometimes the payment is only partly in money, especially if farming in some places. In many parts of Scotland the labourers receive meal, peats, potatoes, &c. (3) Opportunities for extra earnings are sometimes of much importance, especially if we take as the wage-earning unit the family and not the individual. At the end of the 18th century Arthur Young, in his celebrated tours, often calls attention to this fact. In Northumberland and other counties a "kind" (i.e. agricultural labourer) is more valued if he has a large working family, and the family earnings are relatively large. (4) Regularity of employment is always, especially in modern times, one of the most important points to be considered. Apart from such obvious causes of fluctuation as the nature of the employment, e.g. in the case of fishermen, guides, &c., there are various social and industrial causes (for a particular and able investigation of which the reader may consult Professor Forxwell's essay on the subject). Under the system of production on a large scale for foreign markets, with widely extended division of labour, it seems impossible to adjust accurately the supply to the demand, and there are in consequence constant fluctuations in the employment of labour. A striking example, happily rare, is furnished by the cotton industry in any civilized country and the Civil War. (5) In forming a scientific conception of real wages we ought to take into account the longer or the shorter duration of the power to labour: the man whose employment is healthy and who lives more comfortably and longer at the same nominal rate of wages may be held to obtain a higher real wage than his less fortunate competitor. It is worth noting, in this respect, that in nearly every special industry there is a liability to some special form of disease: e.g. lace-workers often suffer from diseases of the eyes, miners from diseases of the lungs, &c. Thus, in attempting to estimate real wages, we have to consider all the various conditions of comfort involved in the "quantity of labour" as well as all the conveniences which the nominal wages will purchase and all the supplements in kind.

In a systematic treatment of the wages question it would be natural to examine next the causes which determine the general rate of wages in any country at any time. This is a problem to which economists have given much attention, and is one of great complexity. It is difficult, when we consider the immense variety of conditions which operate in any civilized country and the constant changes which are taking place, even to form an adequate conception of the general rate of wages. There are thousands of occupations of various kinds, and at first sight it may seem impossible to determine, in a manner sufficiently accurate for any useful purpose, an average or general rate of wages, especially if we attempt to take real and not merely nominal wages. At the same time, in estimating the progress of the working-classes, or in comparing their relative positions in different countries, it is necessary to use this conception of a general rate of wages in a practical manner. The difficulties presented are of the same kind as those met with in the determination of the value of money or the general level of prices, and may be overcome to some extent by the same methods. An "index number" may be formed by taking various kinds of labour as fair samples, and the nominal wages thus obtained may be corrected by a consideration of the elements in the real wages to which they correspond. Care must be taken, however, that the quantity and quality of labour taken at different times and places are the same, just as in the case of commodities similar precautions are necessary. Practically, for example, consumption errors are constantly made by taking the rate of wages for a short time (say an hour), and then, without regard to regularity of employment, constructing the annual rate on this basis; and again, insufficient attention is paid to Adam Smith's pithy caution that "there may be more labour in an hour's hard work than in two hours' easy business." But, however difficult it may be to obtain
an accurate measure of the general rate of wages for practical purposes, there can be no doubt as to the value and necessity of the conception in economic theory. For, as soon as it is assumed that industrial competition is the principal economic force in the distribution of the wealth of a community—and this is in reality the fundamental assumption of modern economic science,—a distinction must be drawn between the most general causes which affect all wages and the particular causes which lead to differences of wages in different employments. In other words, the actual rate of wages obtained in any particular occupation depends partly on causes affecting that group compared with others; and partly on the general conditions which determine the relations between labour, capital and production over the whole area in which the industrial competition is effective. (See A. L. Bowley's *Wages in the United Kingdom in the Nineteenth Century* (1900), § 3, for an account of the meaning and use of the average wage.)

Thus the theory of the wages question consists of two parts, or gives the answers to two questions: (1) What are the causes which determine the general rate of wages? (2) Why are wages in some occupations and at some times and places above or below this general rate?

With regard to the first question, Adam Smith, as in almost every important economic theory, gives an answer which comprises two views which were subsequently differentiated into antithesis. "The natural recompense or wages of labour," is the opening sentence of his chapter on wages. But then he goes on to say that "this original state of things, in which the labourer enjoyed the whole produce of his own labour, could not last beyond the first introduction of the appropriation of land and the accumulation of stock." And he thus arrives at the conclusion that "the demand for those who live by wages, it is evident, cannot increase but in proportion to the increase of the funds which are destined to the payment of wages." This is the germ of the celebrated wages-fund theory which was carried to an extreme by J. S. Mill and others; and, although Mill abandoned the theory some time before his death, he was unable to eradicate it from his systematic treatise and to reduce it to its proper dimensions. It is important to observe that in the hands of Mill this theory was by no means, as was afterwards maintained by Elliot Cairnes, a mere statement of the problem to be solved. According to Cairnes (*Leading Principles of Political Economy*, bk. ii.), the wages-fund theory, as given in Mill's *Principles* (bk. ii. ch. xi. § 1), embraces the following statements: (1) the wages-fund is a general term used to express the aggregate of all wages at any given time in possession of the labourers; (2) the amount of the fund depends on the proportion of this fund to the number of people; (3) the amount of the fund is determined by the amount of general wealth applied to the direct purchase of labour. These propositions Cairnes easily reduces to mere verbal statements, and he then states that the real difficulty is to determine the causes which govern the demand and supply of labour. But the most superficial glance, as well as the most careful survey, will convince the reader of Mill's chapters on wages that he regarded the theory not as the statement but as the solution of the problem. For he applies it directly to the determination of many important points in wages, to the criticism of popular remedies for low wages, and to the discovery of what be considers to be legitimate and possible remedies. In fact, it was principally on account of the application of the theory to concrete facts that it aroused so much opposition, which would have been impossible if it had been a mere statement of the problem.

The wages-fund theory as a real attempt to solve the wages question may be resolved into three propositions, which are very different from the verbal truisms of Cairnes. (1) In any country at any time there is a definite rate of amount of capital unconditionally destined for the payment of labour. This is the wages-fund. (2) There is also a determinate number of labourers who must work independently of the rate of wages—that is, whether the rate is high or low. (3) The wages-fund is distributed amongst the labourers solely by means of competition, masters competing with one another for labour, and labourers with one another for work, and thus the average rate of wages depends on the proportion between wage-capital and population. It follows then, according to this view, that wages can only rise either owing to an increase of capital or a diminution of population, and this accounts for the exaggerated importance attached by Mill to the Malthusian theory of population. It also follows from the theory that any restraint of competition in one direction can only cause a rise of wages by a corresponding fall in another quarter, and in this form it was the argument most frequently urged against the action of trade unions. It is worth noting, as showing the vital connexion of the theory with Mill's principles, that it is practically the foundation of his propositions on capital in his first book, and is also the basis of the exposition in his fourth book of the effects of the progress of society on the condition of the working-classes.

It has often been remarked that, in economics as in other sciences, what eventually assumes the form of the development of or supplement to an old theory at first appears as if in direct antagonism to it, and there is reason to think that the criticism of the wages-fund theory was carried to an extreme, and that the essential elements of truth which it contains were overlooked. In many respects the theory may be regarded as a good first approximation to the complete solution of the problem. The plan favoured by some modern economists of regarding wages simply as the price of labour determined as in the case of other prices solely by demand and supply, looked from some points of view, is apt to lead to a maladjustment of emoluments in other directions. The supply of labour, for example, is in many ways on a different footing from the supply of commodities. The causes which the wages-fund theory emphasizes too exclusively are after all *severa causae*, and must always be taken into account. There can be no doubt, for example, that under certain conditions a rapid increase in the labouring population may cause wages to fall, just as a rapid decline may make them rise.

The most striking example of a great improvement in the condition of the labouring classes in English economic history is found immediately after the occurrence of the Black Death in the middle of the 14th century. The sudden and extensive thinning of the ranks of labour was manifestly the principal cause of the great improvement in the condition of the survivors.

Again, as regards the amount of capital competing for labour, the reality of the cause admits of no dispute, at any rate in any modern society. The force of this element is perhaps best seen by taking a particular case and assuming that the general wages-fund of the country is divided into a number of smaller wages-funds. Take, for example, the wages of domestic servants when the payment of wages is made simply for the service rendered. We may fairly assume that the richer classes of the community practically put aside so much of their revenue for the payment of the wages of their servants. The aggregate of these sums is the domestic wages-fund. Now, if owing to any cause the amount available for this purpose falls off, whilst the number of those seeking that class of employment remains the same, the natural result would be a fall in wages. It may of course happen in this as in other cases that the result is not so much a direct effect on the wages of servants as a diminution of employment; but even in this case, if people employ fewer servants, they must do more work. Again, if we were to seek for the reason why the wages of governnesses are so low, the essence of the answer would be found in the excessive supply of that kind of labour compared with the funds destined for its support. And similarly through the whole range of employments in which the labour is employed in perishable services and not in material products, the wages-fund theory brings into prominence the principal causes governing the rate of wages, namely, the number of people competing, the amount of the fund, and it compels us to look for the effectiveness of the competition. This view also is in harmony with the great principles of demand and supply. If we regard labour as a commodity and wages as the price paid for it, then we may say that the price will be so adjusted that the quantity demanded
WAGES

will be made equal to the quantity offered at that price,—the agency by which the equation is reached being competition.

But when we turn to other facts for the verification of the theory we easily discover apparent if not real contradictions. The case of Ireland after the potato famine affords an instance of a rapidly declining population without any corresponding rise in wages, whilst in new countries we often find a very rapid increase of population accompanied by an increase in wages. In a similar manner we find that the capital of a country may increase rapidly without wages rising in proportion—as, for example, seems to have been the case in England after the great mechanical improvements at the end of the 18th century up to the repeal of the Corn Laws—whilst in new countries where wages are the highest there are generally complaints of the scarcity of capital. But perhaps the most striking conflict of the theory with facts is found in the periodical inflations and depressions of trade. After a commercial crisis, when the shock is over and the necessary liquidation has taken place, we generally find that there is a period during which there is a glut of capital and yet wages are low. The abundance of capital is shown by the low rate of interest and the difficulty of obtaining remunerative investments. Accordingly this apparent failure of the theory, at least partially, makes it necessary to examine the propositions into which it was resolved more carefully, in order to discover, in the classical economic phraseology, the "disturbing causes." As regards the first of these propositions—that there is always a certain amount of capital destined in reality for the employment of labour—it is plain that this destination is not really unconditional. In a modern society whether or not a capitalist will supply capital to labour depends on the rate of profit expected, and this again depends proximately on the course of prices. But the theory as stated can only consider profits and prices as acting in an indirect roundabout manner upon wages. If profits are high then more capital can be accumulated and there is a larger wages-fund, and if prices are high there may be some stimulus to trade, but the effect on real wages is considered to be very small.

In fact Mill writes it down as a popular delusion that high prices make high wages. And if the high prices are due purely to currency causes the criticism is in the main correct, and in some cases, as was shown above, high prices may mean real low wages. If, however, we turn to the great classes of employments in which the labour is embodied in a material product, we find on examination that wages vary with prices in a real and not merely in an illusory sense. Suppose, for example, that, owing to a great increase in the foreign demand for British produce, a rise in prices takes place, there will be a corresponding rise in nominal wages, and in all probability a rise in real wages. Such was undoubtedly the case in Great Britain on the conclusion of the Franco-German War.

On the other hand, if prices fall and profits are low, there will so far be a tendency to contract the employment of labour. At the same time, however, to some extent the capital is supplied unconditionally—in other words, without obtaining what is considered adequate remuneration, or even at a positive loss. The existence of a certain amount of fixed capital practically implies the constant employment of a certain amount of labour.

Nor is the second proposition perfectly true, namely, that there are always a certain number of labourers who must work independently of the rate of wages. For the returns of pauperism and other statistics show that there is always a proportion of "floating" labour sometimes employed and sometimes not. Again, although, as Adam Smith says, man is of all luggage the most difficult to be transported, still labour as well as capital may be attracted to foreign fields. The constant succession of strikes resorted to in order to prevent a fall in wages shows that in practice the labourers do not at once accept the "natural" market rate. Still, on the whole, this second proposition is a much more adequate expression of the truth than the first; for labour cannot afford to lie idle or to emigrate so easily as capital.

The third proposition, that the wages-fund is distributed solely by competition, is also found to conflict with facts. Competition may be held to imply in its positive meaning that every individual strives to attain his own economic interests regardless of the interests of others. But in some cases this end may be attained most effectively by means of combination, as, for example, when a number of people combine to create a practical monopoly. Again, the end may be attained by leaving the control to government, or by obeying the unwritten rules of a long-established custom. But these methods of satisfying economic interests are opposed to competition in the usual sense of the term, and certainly as used in reference to labour. Thus on the negative side competition implies that the economic interests of the persons concerned are attained neither by combination, nor by law, nor by custom. Again, it is also assumed, in making competition the principal distributing force of the national income, that every person knows what his real interests are, and that there is perfect mobility of labour both from employment to employment and from place to place. Without these assumptions the wages-fund would not be evenly distributed according to the quantity of labour. It is, however, obvious that, even in the present industrial system, competition is modified considerably by these disturbing agencies; and in fact the tendency seems to be more and more for combinations of masters on one side and of men on the other to take the place of the competition of individuals.

The attempted verification of the wages-fund theory leads to so many important modifications that it is not surprising to find that and thus in the wages of labour. Again, the older view was that capital must be first accumulated in order afterwards to be divided up into wages, as if apparently agriculture was the normal type of industry, and the workers must have a store to live on until the new crop was grown and secured. But the "produce" theory of wages considers that wages are paid continuously out of a continuous product, although in some cases they may be advanced out of capital or accumulated stores. According to this view wages are paid out of the annual produce of the land, capital and labour, and not out of the savings of previous years. Thus, the danger is in the attempt of the theory to an untenable extreme, and overlooking altogether the function of capital in determining wages; and the true solution seems to be found in a combination of the "produce" theory with the "fund" theory.

An industrial society may be regarded, in the first place, as a great productive machine turning out a vast variety of products for the consumption of the members of the society. The distribution of these products, so far as it is not modified by other social and moral conditions, depends upon the principle of "reciprocal demand." In a preliminary rough classification we may make three groups—the owners of land and natural agents, the owners of capital or reserved products and instruments, and the owners of labour. To obtain the produce requisite even for the necessary wants of the community a combination of these three groups must take place, and the relative reward obtained
by each will vary in general according to the demands of the others for its services. Thus, if capital, both fixed and circulating, is scanty, whilst labour and land are both abundant, the reward of capital will be high, simply because the price of wages. This is well illustrated in the high rate of profits obtained in early societies. According to this view of the question the aggregate amount paid in wages depends partly on the general productiveness of all the productive agents and partly on the relative power of the labourers as compared with the owners of land and capital (the amount taken by government and individuals for taxes, charity, &c., being omitted). Under a system of perfect industrial competition the general rate of wages would be so adjusted that the demand for labour would be just equal to the supply at that rate. (Compare Marshall's Principles of Economics, bk. vi. ch. ii.)

If all labour and capital were perfectly uniform it would not be necessary to carry the analysis further, but as a matter of fact, instead of two great groups of labourers and capitalists, we have a multitude of subdivisions all under the influence of reciprocal demand. Every subgroup tries to obtain as much as possible of the general product, which is practically always measured in money. The determination of relative wages depends on the constitution of these groups and their relations to one another. Under any given social conditions there must be differences of wages in different trades; which may be regarded as permanent until some change occurs in the conditions; in other words, certain differences of wages are stable or normal, whilst others depend simply on temporary fluctuations in demand and supply. A celebrated chapter in the Wealth of Nations (bk. i. ch. x.) is still the best basis for the investigation of these normal differences—which, as stated above, is the second principal problem of the wages question. First of all, a broad distinction may be drawn between the natural and artificial causes of difference, or, in Adam Smith's phraseology, between those due to the nature of the employments and those due to the policy of Europe. In the former division we have (1) the agreeableness or disagreeableness of the employment, illustrated by two classical examples—"honour makes a great part of the reward of all honourable professions," and "the most detestable of all employments—that of public executioner—is, in proportion to the work done, better paid than any common trade whatever." There is, however, much truth in Mill's criticism, that in many cases the worst paid of all employments are at the same time the most agreeable, and that men are drawn to them by the fact of it being almost entirely a matter of personal taste. (2) The economic law that education is practically no other thing than education in commerce, or, as Adam Smith puts it, "the backbone of the merchant, the strength of the merchant in a new country, is education, and education is no less necessary to the merchant than to the lawyer, the physician, and the clergyman. It is more necessary, because the merchant is almost always, in the proper sense of the word, a self-made man; the lawyer, the physician, and the clergyman are all brought up by education, and almost always the rich on forty pounds a year," whilst many only obtained £80 or £100 a year. The wages earned by a journeyman shoemaker. In the same way a state-aided education of a commercial and technical kind may result in lowering the rates (relatively) of the educated business classes. It is said that one reason why the Germans replace Englishmen in many branches is that, having obtained their education at a low rate, there are more of them qualified, and consequently they accept lower wages. The customary idea that the position of a clerk is more genteel than that of an artisan accounts largely for the excessive competition in the former class, especially now that education is practically universal. (3) In some cases law and custom may impede or promote the circulation of labour. At the time Adam Smith wrote the laws of settlement were still in full operation. "There is not a man of forty who has not felt most cruelly oppressed by this ill-considered law of settlement." Differences in wages in different parts of the same country and in different occupations are still largely due to impediments in the way of the movement of labour, which might be removed or lessened by the government making provisions for migration or emigration. (4) On many occasions in the past the law often directly interfered to regulate wages. The Statute of Labourers, passed immediately after the Black Death, was an attempt in this direction, but it appears to have failed, according to the investigations of Thorold Rogers. The same writer, however, ascribes to the celebrated Statute of Apprentices (5th of Elizabeth) the degradation of the English labourer for nearly three centuries (Agriculture and Prices, vol. v.). This, he asserts, was due to the wages being fixed by the justices of the peace. It is, however, worth noting that Bretonno, who is equally sympathetic with the claims of labour, especially in that so long as this statute was actually enforced, the customs founded upon it were observed, the condition of the labourers was prosperous, and that the degradation only began when the statute fell into disuse (Origin of Gilds and Trade Unions. For a full account of the effect of the Statute of Apprentices see W. Cunningham's Growth of English Industry and Commerce, vol. ii.).
WAGES

Something must be said as to the power of the state to regulate wages. As far as any direct regulation is concerned, it seems to be only possible within narrow limits. The state might of course institute certain complex sliding-scales for the payment of labour and make them compulsory, but this would rather be an official declaration of the natural market rate than a direct regulation. Any rate which the state of trade and prices would not bear could not be enforced: masters could not be compelled to work at a loss or to keep their capital employed when it might be more advantageous transferred to another place or occupation. Thus the legal rate could not exceed to any considerable extent the market rate. Nor, on the other hand, could a lower rate in general be enforced, especially when the labourers have the right of combination. Apart from this, the competition of capitalists for labour would tend to raise wages above the legal rate, and evasion would be extremely easy.

The best illustration of the failure to raise the rate of wages directly by authority is found in the English poor law system between 1796 and 1834. "In the former year (1796) the decisively fatal step of legalizing out-relief to the able-bodied, and in aid of wages, was taken," and "In February 1834 was published perhaps the most remarkable and startling document to be found in the English, perhaps in the whole of world, legislation of this kind," (Fowell's Poor Law). The essence of the system was in the justices determining a natural rate of wages, regard being paid to the price of necessaries and the size of the labourer's family, and an amount was given from the rates sufficient to make up the wages received to this natural level. The method of administration was certainly bad, but the best administration possible could only have kept the system in existence a few years longer. In one parish the poor-rate had swallowed up the whole value of the land, which was going out of cultivation, a fact which has an obvious bearing on land nationalization. But the fact remained that the workers became careless, inefficient and improvident. Those who were in regular receipt of relief were often better off (in money) than independent labourers. But the most important consequence was that the real wages obtained were, in spite of the relief, lower than otherwise they would have been, and a striking proof was given that wages are paid out of the produce of labour. The Report of the Poor Law Commissioners (1834) states emphatically (p. 48) that "the severest sufferers are those for whose benefit the system is supposed to have been introduced and to be perpetuated, the labourers and their families. In independent labour this suffering is directly felt by the unfair competition of the pauper labour, but, as one of the sub-reporters stated, in every district the general condition of the independent labourer was strikingly distinguishable from that of the pauper and superior to it, though the independent labourers were commonly maintained upon less money. In New Zealand and Australia in recent years a great extension has been made of the principle of state intervention in the regulation of wages.

But, although the direct intervention of the state, with the view of raising the nominal rates of wages, is, according to theory and experience, of doubtful advantage, still, when we consider real wages in the evident sense of the term, there seems to be an almost indefinite scope for state interference. The effect of the Factory Acts and similar legislation has been undoubtedly to raise the real wages of the working-classes as a whole, although at first the same arguments were used in opposition to these proposals as in the case of direct relief from the poor-rates. But there is a vital difference in the two cases, because in the former the tendency is to increase whilst in the latter it is to diminish the energy and spirit of the workers. An excellent summary of the results of this species of industrial legislation is given by John Morley (Life of Cobden, vol. i. p. 303):

"We have to-day a complete, minute, and voluminous code for the protection of labour: buildings must be kept pure of efluvia; dangerous machinery must be fenced; children and young persons must not clean it while in motion; their hours are not only limited but fixed; continuous employment must not exceed a given number of hours, varying with the trade but prescribed by the law in each case; a statuteable number of holidays is imposed; the children must go to school, and the employer must have every week a certificate to that effect; if an accident happens notice must be sent to the proper authorities; the unions have been made legal; houses, for lace-making, for colliers, and for a whole schedule of other special callings; for the due enforcement and vigilant supervision of this immense host of minute prescriptions there is a court of licensing and district inspectors, and other authorities whose business it is to 'speed and post o'er land and ocean' on sullen guardianship of every kind of labour, from that of the woman who plait straw at her cottage door to the mining louses, who descends into the bowels of the earth and the seaman who conveys the fruits and materials of universal industry to and fro between the remotest parts of the globe."

The analysis previously given of real wages shows that logically all these improvements in the conditions of labour, by diminishing the "quantity of labour" involved in work, are essentially a real rise in wages. Experience has also shown that the state may advantageously interfere in regulating the methods of paying wages. A curious poem, written about the time of Edward IV., on England's commercial policy (Political Songs and Poems, Rolls Series, i. 282), shows that even in the 15th century the "truck" system was in full operation, to the disadvantage of the labourers. The cloth-makers, in particular, compelled the workers to take half of their wages in merchandise which they estimated at higher than its real value. The writer proposes that the "truck folk be paid in good more," and his advice is enforced by law in the obscure ordinance of 14th century which is said to have been enacted in the 4th year of Edward IV. The Truck Acts have since been much further extended. Again, the legislation directed against the adulteration of all kinds of goods, which also finds its prototypes in the middle ages, is in its effects equivalent to a rise in real wages.

The power of trade unions in regulating wages is in most respects analogous in principle to that of legislation just noticed. Nominal wages can only be affected within comparatively narrow limits, depending on the condition of the trade and the state of prices, whilst in many cases there is a real rise in wages. The effect of trade unions may be accomplished by a corresponding depression elsewhere. At the same time, however, it can hardly be questioned that through the unions nominal wages have on the whole risen at the expense of profits—that is to say, that combinations of labourers can make better bargains than individuals. But the debatable margin which may make either extra profits or extra wages itself small, and the principal direct effect of trade unions is to make wages fluctuate with prices, a rise at one time being compensated by a fall at another. The interests of their members in many ways which improve their general condition or raise the real rate of wages, and when nominal wages have attained a natural maximum, and some method of arbitration or sliding-scale is in force, this indirect action means the principal function of trade unions. The effects of industrial partnership (cf. Sedley Taylor's Profit Sharing) and of productive co-operation (cf. Holyoake's History of Co-operation) are small in amount (compared with the total industry of any country) though excellent in kind, and there seem to be no signs of the decay of the entrepreneur system. Again, the effects of the industrial revolution which took place about the end of the 18th century, involving radical changes in production, destroyed the old relations between capital and labour, and perhaps the most interesting part of the history of wages is that covered by the 19th century. For fifty years after the introduction of production on a large scale, the condition of the working-classes was on the whole deplorable, but great progress has since been made. The principal results may be summed up under the effects of machinery and machinery affects the condition of the working-classes in many ways. The most obvious mode is the direct substitution of machinery for labour. It is clear that any sudden and extensive adoption of labour-saving machinery

---

may, by throwing the labourers out of employment, lower the rate of wages, and it is easy to understand how riots arose repeatedly owing to this cause. But as a rule the effect of labour-saving machinery in diminishing employment has been greatly exaggerated, because two important practical considerations have been overlooked. In the first place, any radical change made in the methods of production will be only gradually and continuously adopted throughout the industrial world; and in the second place these radical changes, these discontinuous leaps, tend to give place to advances by small increments of invention. We have an instance of a great radical change in the steam-engine. Watt's patent for "a method of lessening" the consumption of steam and fuel in fire-engines was published on January 5, 1769, and the movement for utilizing steam-power still found room for extension for a century afterwards. The history of the power-loom again shows that the adoption of an invention is comparatively slow. In 1813 there were not more than 2400 power-looms at work in England. In 1820 they increased to 14,150. In 1853 there were 100,000, but the curious thing is that during this time the number of hand-looms had actually increased to some extent (Porter's Progress of the nation, p. 186). The power-loom also illustrates the gradual continuous growth of improvements. This is clearly shown by Porter. A very good hand-weaver, twenty-five or thirty years of age, could weave two-thirds of a yard per hour in 1823; a steam-loom weaver, about fifteen years of age, attending two looms, could weave nine similar pieces in a week. In 1826 a steam-loom weaver, about fifteen, attending to four looms, could weave twelve similar pieces a week. In 1833 a steam-loom weaver, from fifteen to twenty, assisted by a girl of twelve, attending to four looms, could weave eighteen pieces. This is only one example, for, as Porter remarks, it would fill many large volumes to describe the numerous inventions which during the 19th century imparted facility to manufacturing processes, and in every case we find a continuity in the improvements. It is this cumulative character of invention in favour of the labourer—in the first place, because in most cases the increased cheapness of the commodity consequent on the use of machinery causes a corresponding extension of the market and the amount produced, and thus there may be no actual diminution of employment even temporarily; and secondly, if the improvement takes place slowly, there is time for the absorption of the redundant labour in other employments. It is quite clear that on balance the great increase in population in the 19th century was largely caused, or rather rendered possible, by the increased use of machinery. In 1823 a steam-loom in which the working-classes were at first injured by the adoption of machinery was not so much by a diminution in the number of hands required as by a change in the nature of the employment. Skilled labour of a certain kind lost its peculiar value, and children and women were able to do work formerly only done by men. But the principal evils resulted from the wretched conditions under which, before the factory legislation, the work was performed; and there is good reason to believe that a deterioration of the type of labourer, both moral and physical, was effected. It is, however, a mistake to suppose that on the whole the use of machinery tends to dispense with skill. On the contrary, everything goes to prove that under the present system of production, and by a large scale there is on the whole far more skill required than formerly—a fact well brought out by Sir Robert Giffen in his essay on the progress of the working-classes (Essays on finance, vol. ii. p. 305), and expressed by the official reports on wages in different countries. (J. S. N.)

WAGGA-WAGGA, a town of Wynyard county, New South Wales, Australia, on the left bank of the river Murrumbidgee, 300 m. by rail S.W. of Sydney and 267 m. N.E. of Melbourne. Pop. (1901) 5114. The Murrumbidgee is here spanned by a steel viaduct, the approaches of which are formed by heavy embankments. Wagga-Wagga has a school of art with a library attached, a fine convent picturesquely situated on Mount Erin, a good racecourse and agricultural show-grounds. There is a considerable amount of gold-mining in the district, which, however, is chiefly pastoral, although cereals, tobacco and wine are produced in considerable quantities.

WAGNER, ADOLF (1835— ), German economist, was born at Erlangen on the 25th of March 1835. Educated at Göttingen and Heidelberg, he was professor of political science at Dorpat and Freiburg, and after 1870 at Berlin. A prolific writer on economic problems, he brought out in his study of the subject the close relation which necessarily exists between economics and jurisprudence. He ranks without doubt as one of the most eminent German economists and a distinguished leader of the historical school. His leanings towards Christian socialism made him one of those to whom the appellation of "Katheder Sozlisten" or "socialists of the (professional) chair" was applied, and he was one of the founders of the Verein für Socialpolitik. In 1871 he undertook, in conjunction with Professor E. Nasse (1829-1890), a new edition of Rau's Lehrbuch der politischen Ökonomie, and his own special contributions, the Grundlegung und Finanzwissenschaft, afterwards published separately, are probably his most important works. He approaches economic studies from the point of view that the doctrine of the jus naturae, on which the physiocrats reared their economic structure, has lost its hold on belief, and that the old a priori and absolute conceptions of personal freedom and property have given way to a closer and more practical rule. He lays down that the economic position of the individual, instead of depending merely on so-called natural rights or even on his natural powers, is conditioned by the contemporary juristic system, which is itself an historical product. These conceptions, therefore, of freedom and property, half economic, half juristic, require a fresh examination. Wagner accordingly investigates, before anything else, the conditions of the economic life of the community, and in sub-ordination to this, determines the sphere of the economic freedom of the individual. Among his works are Beiträge zur Lehre von der nationalen Wirtschaft (1869-1870), Grundlegung und Finanzwissenschaft (1870-1873) and Agrar- und Industriesaat (1902).

His brother, HERMANN WAGNER (1840— ), a distinguished geographer, joined the Geographical Institute of Justus Perthes in 1868, and was editor of the statistical section of the Gothaer Almanack up to 1876. In 1872 he founded Die Bevölkerung der Erde, a critical review of area and population, and in 1880 he was appointed professor of geography at Gottingen. He was editor of the Geographisches Jahrbuch from 1880 to 1908. His publications include Lehrbuch der Geographie (7th ed., 1903) and Mecklenburgische Schauplätze (12th ed., 1907).

WAGNER, RUDOLPH (1805-1864), German anatomist and physiologist, was born on the 30th of June 1805 at Bayreuth, where his father was a professor in the gymnasium. He began the study of medicine at Erlangen in 1822, and finished his curriculum in 1826 at Würzburg, where he had attached himself mostly to J. L. Schönlein in medicine and to K. F. Heseinger in comparative anatomy. Aided by a public stipendium, he spent a year or more studying in the Jardin des Plantes, under the friendly eye of Cuvier, and in making zoological discoveries at Cagliari and other places on the Mediterranean. On his return he set up in medical practice at Augsburg, whether his father had been transferred; but in a few months he found an opening for an academical career, on being appointed prosecutor at Erlangen. In 1832 he became full professor of zoology and comparative anatomy there, and held that office until 1840, when he was called to succeed J. F. Blumenbach at Gottingen. At the Hanoverian university he remained till his death, being much occupied with administrative work as pro-rector for a number of years, and for nearly the whole of his residence troubled by ill-health (phthisis). In 1856 he gave over the physiological part of his teaching to a new chair, retaining the zoological, with which his career had begun. While at Frankfurt, on his way to examine the Neanderthal skull at Bonn, he was struck with paralysis, and died at Gottingen a few months later on the 13th of May 1864.

Wagner's activity as a writer and worker was enormous, and his range extensive, most of his hard work having been done at Erlangen while his health was good. His graduation thesis was on the
ambitious subject of "the historical development of epidemic and contagious diseases all over the world, with their laws of their diffusion," which showed the influence of Schönlein. His first treatise was 

Die Naturgeschichte des Menschen (in 2 vols., Kempen, 1831). Frequent journeys abroad gave him abundant materials for research on invertebrate anatomy and physiology, which he communicated first to the Munich academy of sciences, and republished in his Beiträge zur vergleichenden Anatomie, 1830, 1832, and 1836. He published a twelfth book of Zoology (Leipzig, 1838). In 1834-1835 he brought out a textbook on the subject of his chair (Lehrbuch der vergleichenden Anatomie, Leipzig), which recommended itself to students by its clear and comprehensive descriptions. He published also in 1843 a second edition of Lehrbuch der Zootomie, of which only the vertebrate section was corrected by himself. The precision of his earlier work is evidenced by the large amount of subsequent literature that was produced. He also wrote a handbook of \(\text{Allgemeine Physiologie der Pflanzen}^1\) (Leipzig, 1834). His zoological labours may be said to conclude with the atlas Icones zoologicae (Leipzig, 1841). In 1835 he communicated to the Munich academy of sciences his researches on the brain, and in 1836 a bold attempt was made to include the famous discovery of the germinal vesicle of the human ovum. These were republished under the title Promodromi historiae \(\text{generallis hominis}^1\) (Leipzig, 1835). In zoology, he contributed several articles to the Zoologische Jahrbücher (Leipzig, 1838), and a treatise on Physiologie der Pflanzen (Leipzig, 1839). In the same year he published his study on beagles, and brought out the fifth (supplementary) volume in 1852; the only contributions of his own in it were on the sympathy nerve, ganglia and nerve-endings, and he modestly disclaimed all merit except as being the organism representing the results of his long labours. He occupied himself with researches on the electrical organ of the torpedo and on nervous organization generally; these he published in 1853-1854 (\text{Neurologische Untersuchungen}, Göttingen), and therewith his physiological labours may be said to end. His next period was stormy and controversial. He entered the lists boldly against the materialism of \textit{Stoff und Kraft}, and avowed himself a Christian believer, whereupon he lost the countenance of a number of his old friends and pupils, and was unfeignedly told that he was suffering from an "atrophy of the brain." His quarrel with the materialists began with a paper read at the meeting of the Göttinger Gesellschaft der Wissenschaften in 1854, on "Menschenskopf und Seelensubstanz." This was followed by a series of "Physiological Letters" in the \textit{Allgemeine Zeitung}, by an essay on "Glauben und Wissen," and by the book "Der Kampf um die Seele" (Göttingen, 1857). Having come to the consideration of these philosophical problems late in life, he was at some disadvantage; but he endeavoured to join as he best could in the current of contemporary scientific and religious thought. He maintained his knowledge of German writings, especially more of Goethe’s, and of the literature connected with him. In what may be called his fourth and last period, Wagner became anti-theologian and agnostic, occupied himself with the cabinet of skulls in the Göttinger museum collected by Blumenbach and with the excavation of prehistoric remains, corresponded actively with the anthropological societies of Paris and London, and organized, in co-operation with the veteran K. E. von Baer, a successful congress of anthropologists at Göttingen in 1861. His last writings were memoirs on the convulsions of the human brain, on the weight of brains, and on the brains of idiots (1860-1862).

See memoir by his eldest son in the \textit{Göttinger gelehrte Anzeigen}, \textit{Nachrichten} for 1864.

WAGNER, WILHELM RICHARD (1813-1883), German dramatic composer, poet, essay-writer, was born at Leipzig on the 22nd of May 1813. In 1822 he was sent to the Kreuzschule at Dresden, where he did so well that, four years later, he translated the first twelve books of the \textit{Bodicey} for amusement. In 1831 he composed his \textit{Ludwig von der Nietzsche}, a little oratorio, of which no trace remains. His first music master was Gottlob Müller, who thought him self-willed and eccentric; and his first production as a composer was an overture, performed at the Leipzig theatre in 1830. In that year he matriculated at the university, and took lessons in composition from Theodor Weinlig, cantor at the Thomasschule. A symphony was produced at the Gewandhaus concerts in 1833, and in the following year he was appointed conductor of the opera at Magdeburg. The post was unprofitable, and Wagner’s life at this period was very unsettled. He had composed an opera called \textit{Die Feen} adapted by himself from Goethe’s \textit{La Devon Serpent} and another, \textit{Das Liebesverbot}, founded on Shakespeare’s \textit{Measure for Measure}, but only \textit{Das Liebesverbot} obtained a single performance in 1836.

In that year Wagner married Wilhelmina Planer, an actress at the theatre at Königsberg. He had accepted an engagement there as conductor; but, the lessee becoming bankrupt, the scheme was abandoned in favour of a better appointment at Riga. Accepting this, he remained actively employed until 1839, when he made his first visit to Paris, taking with him an unfinished opera based on Bulwer Lytton’s \textit{Rienzi}, and, like his earlier efforts, his own libretto. The venture proved most unfortunate. Wagner failed to gain a footing, and his work, destined for the Grand Opera, was rejected. He completed it, however, and in 1842 it was produced at Dresden, where, with Madame Schroeder Devrient and Herr Tichatschek in the principal parts, it achieved a success which went far to make him famous.

But though in \textit{Rienzi} Wagner had shown energy and ambition, that work was far from representing his preconceived ideas. This he now endeavoured to embody in \textit{Der fliegende Holländer}, for which he designed a libretto quite independent of any other treatment of the legend. The piece was warmly received at Dresden on the 13th of January 1843; but its success was by no means equal to that of \textit{Rienzi}. Speroh, however, promptly discovered its merits, and produced it at Cassel some months later, with very favourable results.

On the 2nd of February 1843 Wagner was formally installed as Hofkapellmeister at the Dresden theatre, and he soon set to work on a new opera. He chose the legend of Tannhäuser, collecting his materials from the ancient \textit{Tannhäuser-Lied}, the \textit{Vokabuch}, Tieck’s poetical \textit{Erzahlung}, Hoffmann’s story of \textit{Der Fliegende Holländer}, and Tieck’s poem for \textit{The Wartburg}. This material Wagner introdced into the initial scene of \textit{Lotherranigrin}, and so led Wagner to study of Wolfram von Eschenbach’s \textit{Parzival} and \textit{Titurel}, with great results later on. But for the present he confined himself to the subject in hand; and on the 10th of October 1845 he produced his \textit{Tannhäuser}, with Schroeder Devrient, Johanna Wagner, Tichatschek and Mitterwurzer in the principal parts. Notwithstanding this powerful cast, the success of the new work was not brilliant, for it carried still further the principles embodied in \textit{Der fliegende Holländer}, and the time was not ripe for them. But Wagner never lost heart, and managed to bring his \textit{Tannhäuser} through its earlier engagements (1845-1846) of which he was not taken part in the political agitations of 1849, after which his position in Dresden became untenable. In fact, after the flight of the king and the subsequent suppression of the riots, a warrant was issued for his arrest; and he had barely time to escape to Weimar, where Liszt was at that moment engaged in preparing \textit{Tannhäuser} for performance, before the storm burst upon him with alarming violence. In all haste Liszt procured a passport and escorted his guest as far as Eisenach. Wagner fled to Paris and thence to Zürich, where he lived in almost unbroken retirement until the autumn of 1859. During this period most of his prose works—including \textit{Oper und Drama, Über das Dirigieren, Das Judentum in der Musik}—were given to the world.

The medieval studies which Wagner had begun for his work at the libretto of \textit{Tannhäuser} bore rich fruit in his next opera \textit{Lohengrin}, in which he also developed his principles on a larger scale and with a riper technique than hitherto. He had completed the work before he fled from Dresden, but could not get it produced. But he took the score with him to Paris, and, as he himself tells us, when ill, miserable and despairing, that brooding over my fate, my eyes fell on the score of \textit{Lohengrin}, which I had totally forgotten. Suddenly I felt something like compassion that the music should never sound off from the death-pale paper. Two words I wrote to Liszt; his answer was the news that preparations were being made for the performance of the work, on the grandest scale that the limited means of Weimar would permit. Everything that care and accessories

1 The composer’s niece.
WAGNER 237
could do was done to make the design of the piece understood. Lobengrin was, in fact, produced at Weimar under Liszt's direction on the 28th of August 1850. It was a severe trial to Wagner not to hear his own work, but he knew that it was in good hands, and he responded to Liszt's appeal for a new creation by studying the Nibelungenlied and generally shaping it into a grand opera. At this time also he first began to lay out the plan of Tristan und Isolde, and to think over the possibilities of Parsifal.

During his exile Wagner matured his plans and perfected his musical style; but it was not until some considerable time after his return that any of the works he then meditated were placed upon the stage. In 1855 he accepted an invitation to London, where he conducted the concerts of the Philharmonic Society with great success. In 1857 he completed the libretto of Tristan und Isolde at Venice, adopting the Celtic legend modified by Gottfried von Strassburg's 8th-century version. But the music was delayed until the strange incident of a message from the emperor of Brazil encouraged Wagner to complete it in 1859. In that year Wagner visited Paris for the third time; and after much negotiation, in which he was nobly supported by the Prince and Princess Metternich, Tannhäuser was accepted at the Grand Opéra. Magnificent preparations were made; it was rehearsed 104 times, 14 times with the full orchestra; and the scenery and dresses were placed entirely under the composer's direction. More than 5000 was expended upon the venture; and the work was performed for the first time in the French language and with the new Venusberg music on the 13th of March 1861. But, for political reasons, a powerful clique was determined to suppress Wagner. A scandalous riot was inaugurated by the members of the Parisian Jockey Club, who interrupted the performance with howls and dog-whistles; and after the third representation the opera was withdrawn. Wagner was broken-hearted.

The Princess Metternich continued to befriend him, and by 1860 she had obtained a pardon for his political offences, with permission to settle in any part of Germany except Saxony. Even this restriction was removed in 1862.

He settled for a time in Vienna, where Tristan und Isolde was accepted, but abandoned after fifty-seven rehearsals, through the incompetence of the tenor. Lobengrin was, however, produced on the 15th of May 1861, when Wagner heard it for the first time. His circumstances were now extremely straitened; it was the darkness before dawn. In 1863 he published the libretto of Der Ring des Nibelungen. King Ludwig of Bavaria was much struck with it, and in 1864 invited Wagner, who was then at Stuttgart, to come to Munich and finish his work there. Wagner accepted with rapture. The king gave him an annual grant of 1200 guineas (£240), considerably enlarging it before the end of the year, and placing a comfortable house in the outskirts of the city at his disposal. The master expressed his gratitude in a "Huldigungsmarsch." In the autumn he was formally commissioned to proceed with the tetralogy and to furnish proposals for the building of a theatre and the foundation of a Bavarian music school. All promised well, but no sooner did his position seem assured than a miserable court intrigue was formed against him. His political indiscretions at Dresden were made the excuse for bitter persecutions; scandalmongers made his friendship with the ill-fated king a danger to both; and Wagner was obliged to retire to Triebchen near Lucerne for the next six years.

On the 10th of June 1865 at Munich, Tristan und Isolde was produced for the first time, with Herr and Frau Schnorr in the principal parts. Die Meistersinger von Nürnberg, first sketched in 1843, was completed in 1867 and first performed at Munich under the direction of Hans von Bölow on the 21st of June 1868.

The story, though an original one, is founded on the character of Hans Sachs, the poet-shoemaker of Nuremberg. The success of the opera was very great; but the production of the Nibelungen-tetralogy as a whole still remained impracticable, though Das Rheingold and Die Walküre were performed, the one on the 22nd of September 1869 and the other on the 26th of June 1870. The scheme for building a new theatre at Munich having been abandoned, there was no opera-house in Germany fit for so colossal a work. A project was therefore started for the erection of a suitable building at Bayreuth (q.v.). Wagner laid the first stone of this in 1872, and the edifice was completed, after almost insuperable difficulties, in 1876. After this Wagner resided permanently at Bayreuth, in a house named Wahnfried, in the garden of which he built his tomb. His first wife, from whom he had parted since 1861, died in 1865; and in 1870 he was united to Liszt's daughter Cosima, who had previously been the wife of von Bülow. Meantime Der Ring des Nibelungen was rapidly approaching completion, and on the 13th of August 1876 the introductory portion, Das Rheingold, was performed at Bayreuth for the first time as part of the great whole, followed on the 14th by Die Walküre, on the 16th by Siegfried and on the 17th by Götterdämmerung. The performances, directed by Hans Richter, excited extraordinary attention; but the expenses were enormous, and burdened the management with a debt of £7,500. A small portion of this was raised (at great risk) by performances at the Albert Hall in London, conducted by Wagner and Richter, in 1877. The remainder was met by the profits upon performances of the tetralogy at Munich.

Wagner's next and last work was Parsifal, based upon the legend of the Holy Grail, as set forth, not in the legend of the Morte d'Arthur, but in the versions of Chrétien de Troyes and Wolfram von Eschenbach and other less-known works. The libretto was complete before his visit to London in 1877. The music was begun in the following year, and completed at Palermo on the 13th of January 1882. The first sixteen performances took place at Bayreuth, in July and August 1882, under Wagner's own directing, and fully realized all expectations.

Unhappily the exertion of directing so many consecutive performances seems to have been too much for the veteran master's strength, for towards the close of 1882 his health began to decline rapidly. He spent the autumn at Venice, and was well enough on Christmas Eve to conduct his early symphony (composed in 1853) at a private performance given at the Liceo Marzello. But late in the afternoon of the 13th of February his friends were shocked by his sudden death from heart-failure.

Wagner was buried at Wahnfried in the tomb he had himself prepared, on the 18th of February; and a few days afterwards King Ludwig rode to Bayreuth alone, and at dead of night, to pay his last tribute to the master of his world of dreams. (W.S.R.; D.F.T.)

In the articles on Music and Opera, Wagner's task in music-drama is described, and it remains here to discuss his progress in the operas themselves. This progress has perhaps no parallel in any art, and certainly none in music, for even Beethoven's six symphonies was merely an increase in range and power. Beethoven, we know, lost sympathy with his early works as he grew older; but that was because his later works absorbed his interest, not because his early works misrepresented his ideals. Wagner's earlier works have too long been treated as if they represented the pure and healthy childhood of his later ideal; as if Lobengrin stood to Parsifal as Haydn, Mozart and early Beethoven stand to Beethoven's last quartets. But Wagner never thus represented the childhood of an ideal, though he attained the manhood of the most comprehensive ideal yet known in art. To change the metaphor—the ideal was always in sight, and Wagner never swerved from his path towards it; but that path began in a blaze of garish false lights, and it had become very tortuous before the light of day prevailed. Beethoven was trained in the greatest and most advanced musical tradition of his time. For all his Wagnerian impatience, his progress was no struggle from out of a squalid environment; on the contrary, one of his latest discoveries was the greatness of his master Haydn. Now Wagner's excellent teacher Weinlig did certainly, as Wagner himself testifies, teach him more of good music than Beethoven,
Haydn and Mozart could have seen in their youth; for he showed Beethoven. But this would not help Wagner to feel that contemporary music was really a great art; indeed it could only show him that he was growing up in a pseudo-classical time, in which the approval of persons of "good taste" was seldom directed to things of vital promise. Again, he began with far greater facility in literature than in music, if only because a play can be copied ten times faster than a full score. Wagner was always an omnivorous reader, and books were then, as now, both cheaper than music and easier to read. Moreover, the higher problems of rhythmic movement in the classical sonata forms are far beyond the scope of academic teaching, whereas the dramatic context is a matter of musical design; and the instrumental music which was considered the highest style of art in 1830 was as far beyond Wagner's early command of such plausibility as it was obviously already becoming a mere academic game. Lastly, the rules of that game were useless on the stage, and Wagner soon found in Meyerbeer a master of grand opera who was dazzling the world by means which merely disgusted the more serious academic musicians of the day.

But to Rienzi Wagner would already have been Meyerbeer's rival, but that his sincerity, and his initial lack of that musical savoir faire which is prior to the individual handling of ideas, put him at a disadvantage. Though Meyerbeer wrote music that is intrinsically more dull and vulgar than the overture to Rienzi, he never combined such serious efforts with a technique so like that of a military bandleader. The step from Rienzi to Der fliegende Holländer is without parallel in the history of music, and would be inexplicable if Rienzi contained nothing good and if Der fliegende Holländer did not contain many reminiscences of the decline of Italian opera; but it is noticeable that in this contradepose into vulgar music have a distinct dramatic value. Though Wagner cannot as yet be confidently credited with a satiric intention in his bathos, the fact remains that all the Rossinian passages are associated with the character of Daland, so as to express his vulgar delight at the prospect of finding a rich son-in-law in the mysterious Dutch seaman. Meanwhile the rest of the work (except in the prettily scored "Spinning Song," and other harmless and vigorous tunes) has more affinity with Wagner's mature style than the bulk of its more ambitious successors. Rienzi shows a marked attempt to shake off the Germanic influence, which has here become more highly organized and less unequal than that of Tannhäuser; and although Wagner uses less Leit-motif than Weber (see OPERA, Adams) and divides the piece into "numbers" of classical size, the effect is so continuous that the divisions could hardly be guessed by ear. Moreover, the work was intended to be in one act, and is now so performed at Bayreuth; and, although it is very long for a one-act opera, this is certainly the only form which does justice to Wagner's conception.

Spohr's appreciation of Der fliegende Holländer is a remarkable point in musical history; and his criticism that Wagner's style (in Tannhäuser) "lacked rounded periods" shows the best effect of that style on a well-disposed contemporary mind. Of course, from Wagner's mature point of view his early style is far too much cut up by periods and full closes; and its prophetic traits are so incomparably more striking than its resemblance to any earlier art that we often feel that only the full closes stand between it and the true Wagner. But Spohr would feel Wagner's works to be an advance upon contemporary romantic opera rather than a foreshadowing of an unknown future. When we listen to the free declamation of the singers at the outset of Der fliegende Holländer—a declamation which is accompanied by an orchestral and thematic texture as far removed from that of mere recitative as it is from the forms of the classical aria—the repetition of a whole sentence in order to form a firm musical close has almost as quaint a ring as a Shakespearean rhymed tag would have in a prose drama of Ibsen. To Spohr the frequency of these incidents must have produced the impression that Wagner was perpetually beginning arias and breaking them off at once. With all its defects, Der fliegende Holländer is the most masterly and the least unequal of Wagner's early works. As drama it stood immeasurably above any opera since Cherubini's Medée. As a complete fusion between dramatic and musical movement, it is very credits point to its immense advance towards the collapse of the principle of a separate art in music. The operatic style of the 18th century was beyond the genius of the 18th century; but the opera of the 19th century was an attempt to bring music and literature to a higher state of maturity than that of the 18th century. Wagner's genius was a practical as well as a profound mind; and it was not only his operatic style that was the result of his world-wide reading and constant study of the literature of his time. Wagner was a practical man who worked to his own advantage, and he found a practical method to achieve his ends. It is not surprising, therefore, that he should have made so rapid a progress in the field of music.
a very modest reform compared to the banalistic "extra attractions" of every new production of Meyerbeer's.

But there is another side to the picture. With the growing certainty of touch a stiffness of movement appears which gradually disturbs the listener who can appreciate freedom, whether in the classical forms which Wagner plays, or for their operatic connotation or the material flow of the earlier style. Full closes and repeated sentences no longer confuse the issue, but in their absence we begin to notice the incessant squareness of the ostensibly free rhythms. The immense amount of pageantry, though (as in Tannhäuser) good in dramatic motive and executed with splendid stage-craft, goes far to stultify Wagner's already vigorous attitude of protest against grand-opera methods; by way of preparation for the eternally poetic end he gives us a disinfected present from Meyerbeer at the beginning of the last scene, where mounted trumpeters career round the stage in full blast for three long minutes; and the prelude to the third act is an outburst of sheer gratuitous vulgarity. Again, the anti-Wagnerians were entirely justified in penetrating below the splendidly simple and original orchestration of the night-scene between Ortrud and Telramund, and pointing out how feebly its music drifts among a dozen vague keys by means of the diminished 7th; a device which teachers have tried to weed out of every high-flying exercise since that otiose chord was first discovered in the 17th century. The mature Wagner would not have carried out twenty bars in his flattest scenes with so little musical invention. It was in the Tannhäuser that he showed with what desperate effort he was able to work as a man of thirty-five whose claims and aspirations already purport to dwarf the whole record of the classics.

And the defects are in all respects commonplace; they have no resemblance to that uncanny discomfort which often warns the wise critic that he is dealing with an immortal.

The crowning complication in the effect of Der fliegende Holländer, Tannhäuser and Lohengrin on the musical thought of the 19th century was that the unprecedented fusion of their musical with their dramatic contents revealed some of the meaning of serious music to ears that had been deaf to the classics. Wagnerism was henceforth proclaimed to have absorbed the arts of babes and sucklings; learned musicians felt that it had an unfair advantage; and by the time Wagner's popularity began to thrive as a persecuted heresy he had left it in the lurch.

Wagner had hardly finished the score of Lohengrin before he was at work upon the poem of Der Ring des Nibelungen. And with this he suddenly became a mature artist. On a superficial view this is a paradox, for there are many more violations of probability and much graver faults of structure in the later works than in the earlier. Every critic could recognize the stricter form in the Ring than in the Tannhäuser; he had no difficulty in discovering the similarities in the music, the economy of motives and the unifying features of this second work. The Ring is a perfectly organic whole; the music that Wagner wrote for it is unassailable on the basis of a philosophical attitude by love which Wagner strenuously preaches in a passage at the end which remained untested because he considered it already expressed by the music. Indeed, though Wagner's later treatment of love is perhaps the main source of his present popularity it seldom rises to his loftiest regions except where it is thwarted.

The love that is disguised in the deadly feud between Isolde and Tristan, before the drinking of the fatal potion, rises even above the music; the love-duet in the second act depends for its greatness on its introduction, before the lovers have met, and its wonderful slow movement (shortly before the catastrophe) where they are almost silent and leave everything to the music; the intervening twenty minutes is an exhausting storm in which the words are the sophisticated rhetoric of a 19th-century novel of passion, translated into terribly turgid verse and set to music that is more interesting as an intellectual ferment than effective as a representation of emotions which previous dramatists have wisely left to the imagination. But so long as we treat Wagner like a prose philosopher, a librettist, a poet, a mere musician, or anything short of the complex and many-sided artist he really is, we shall find insuperable obstacles to understanding at all points, only to be thwarted by repeated attempts to allegorize the philosophy of Schopenhauer; all efforts to read a consistent scheme, ethical or philosophical, into the result are doomed to failure; but all this matters little, so long as we have Wagner's unfailing later resources in those higher dramatic verities which present to us emotions and actions, human and divine, as things essentially complex and conflicting, inevitable as natural laws, incalculable as natural phenomena.

Wagner's choice of subjects had from the outset shown an imagination far above that of any earlier librettist; yet he had begun with stories which could attract ordinary minds, as he dismayed even his closest friends when he heard them. He had a flinty mind and once he had grasped the idea of a thing he would not be satisfied until he realized it. Thus it is that after he had long pondered over the idea of the Ring, he finally sent a letter to his friend, the composer of the Fliegende Holländer, so pleased that the Parisian wire-pullers that it was promptly set to music by one of their friends. But with Der Ring des Nibelungen Wagner devoted himself to a story which any ordinary dramatist would find as unwieldy as, for instance, most of Shakespeare's subjects; a story in which ordinary canons of taste and probability were violated as they are in real life and in great art.

Wagner's first inspiration was for an opera (Siegfried's Tod, projected in 1848) on the death of Germany's mythical hero; but he found that the story needed a preliminary drama to convey its preconditions. This preliminary drama soon proved to need another to explain it, which again finally needed a short introductory drama. Thus the plan of the Ring was sketched in reverse order; and it has been remarked that Götterdämmerung
shows traces of the fact that Wagner had begun his scheme in the
days when French grand opera, with its ballets and pageantry,
still influenced him. There is little doubt that some redundant
narratives in the Ring were of earlier conception than the four
complete dramas, and that their survival is due partly to Wagner's
natural affection for work on which he had spent pains, and partly
to a dim notion that (like Browning's method in The Ring and
the Beak) they might serve to reveal the story after in the light
of each character. Be this as it may, we may confidently date
the purification of Wagner's music at the moment when he set
work on a story which carried him finally away from that
world of stereotyped operatic passions into which he had already
breathed so much disturbing life.

The disturbing life already appears in Der fliegende Holländer,
at the point where Senta's father enters with the Dutchman,
and Senta (who is already in an advanced state of Schwärmerei
over the legend of the Flying Dutchman) stands rooted to the
spot, comparing the living Dutchman with his portrait which
hangs over the door. The conflict between her passionate fascina-
tion and her disgust at her father's vulgarity is finely realized
both in music and drama; but, if we are able to appreciate it,
then the operatic convention by which Senta avows her passion
becomes crude. Ethical and operatic points of view are similarly
confused when it is asserted that the Flying Dutchman can be
saved by a faithful woman; though it appears from the relations
between Senta and Erik that so long as the woman is faithful
to the Dutchman it does not matter that she jilts some one else.
Erik's passionate claim to accept Elsa without operatic tenor
if his claim on Senta had been less complete. In Tannhäuser
and Lohengrin Wagner's intellectual power develops far more
rapidly in the drama than in the music. The Sängerkrieg, with
its disastrous conflict between the sincere but unnatural asceticism
of the orthodox Minnesingers and the irrepressible human passion
of Tannhäuser, is a conception the vitality of which would
reduce Tannhäuser's repentance to the level of Robert le Diable,
were it not that the music of the Sängerkrieg has no structural
power, and little distinction beyond a certain poetic value in the
tones of violas which had long ago been fully exploited by
Mozart and Méhul, while the music of Tannhäuser's pilgrimage
ranks with the Vorspiel to Lohengrin as a wonderful foreshadow-
ing of Wagner's mature style. Again, the appeal to "God's
judgment" in the trial by battle in Lohengrin is a subject of
which no earlier librettist could have made more than a plausible
mess— which is the best that can be said for the music as music.

But as dramatist Wagner compels our respect for the power that
without gloss or apology brings before us the king, a model of
royal fair-mindedness and good-nature, acquiescing in Tel-
ramund's passionate claim to accept Elsa without operatic tenor,
simply because it is a hard and self-evident fact that the persons
of the drama live in an age in which such claims seemed reason-
able. Telramund, again, is no ordinary operatic villain; there
is genuine tragedy in his moral ruin; and even the melodramatic
Ortrud is a much more life-like intrigante than might be inferred
from Wagner's hyperbolical stage-directions, which almost
always show his manner at its worst.

In Lohengrin we take leave of the early music that obscured
Wagner's ideals, and in the Ring we come to the music which
transcends them all. Here one shakes off the shadow of an artist
a man of more urbane literary intellect he might have been less
ambitious of expressing a world-philosophy in music-drama;
and it is just conceivable that the result might have been a less
interruption of dramatic movement in his later works, and a balance
of ethical ideas at once more subtle and more orthodox. But
it is much more likely that Wagner would then have found his
artistic difficulties too formidable to let the ideas descend to us
from Walhalla and the Hall of the Grail at all. More than a
modicum of rusticity is needed as a protection to a man who
attempts such colossal reforms. This necessity had its conse-
quences in the disguising inequalities of Wagner's early work,
and the undeniable egotism that embittered his fiery nature
throughout his life; while the cut-and-dried system of culture
of later Wagnerian discipleship has revenged him in a specially
sacerdotal type of tradition, which makes progress even in the
study of his works impossible except through revolt. Such are
the penalties exacted by the irony of fate for the world's
persecution of its prophets.

Genuinely dramatic music, even if it seem as purely musical
as Mozart's, must always be approached through its drama; and
Wagner's masterpieces demand that we shall use this approach;
but, as with Mozart, we must not stop on the threshold. Within
Mozart there is no temptation to do so. But with Wagner, just
as there are people who have never tried to follow a sonata but
who have been awakened by his music-dramas to a sense of the
possibilities of serious music, so there are lovers of music who
awow that they owe to Wagner their appreciation of poetry.
But people whose love of literature is more independent find it
hard to take Wagner's poetry and prose seriously, unless they
have already measured him by his music. He effected no reform
in literature; his metatelic adherence to the archaic alliteration
of the Nibelungenlied is not allied with any sense of beauty in
verbal sound or verse-rhythm; and his ways of expressing
emotion in language consist chiefly in the piling-up of super-
latives. Yet he was too full of dramatic inspiration to remain
perpetually victimized by the conscientious affectations of the
amateur author; and, where dramatic situations are not only
poetical but (as in the first act of Die Walküre and the Waldfeben
scene in Siegfried) too elemental for strained language, Wagner
is often supremely eloquent simply because he has no occasion
to try to write poetry. Sometimes, too, when a great dramatic
climax has given place to a perfect expression of all that can
be said on a theme, the language he has used is no less
meritorious than what a poet might have written; but the
lyricism and the poetic quality in the music are so great, and
the historical content and the contemplative tone are so
intimately blended, that the language is in the last analysis
merely an effective means of bringing us to the end of the
passion, to the height of the emotion, of the music, and of the
novel and the drama, in a way that the language of a poet
would be powerless to bring about. To know his music is to
know all literature; to know all literature is to know Wagner's
music.

If we wish to know what Wagner means, we must fight our
way through his drama to his music; and we must not expect
to find that each phrase in the mouth of the actor corresponds
word for note with the music. That sort of correspondence
Wagner leaves to his imitators; and his views on "Leit-motif-
hunting," as expressed in his prose writings and conversation,
are contemptuously tolerant. We shall indeed find that his
orchestra interprets the dramatic situations which his poetry
roughly outlines. But we shall also find that, even if we could
conceive the poet's words will to be a perfect expression of all
that can be said in words and actions, the orchestra will express
something greater; it will not run parallel with the poetry; the
Leitmotiv system will not be a collection of labels; the musical expression
of singer and orchestra will not be a mere heightened resource
of dramatic declamation. All that kind of pre-established harmony
Wagner left behind him the moment he deserted the heroes and
villains of romantic opera for the visionary and true tragedy of
gods and demi-gods, giants and gnomes, with beauty, nobility
and love in the wrong, and the forces of destruction and hate
sent to vindicate them. Let us illustrate Wagner's mature use of Leitmotiv by the theme
which happens to be associated with Alberich's ring. The fact
that this theme is commonly called the "Ring-motif" is a glaring
instance of what Wagner has had to endure from his friends.
Immediate as the ring is throughout the tetralogy, Wagner would
no more think of associating a theme with it for its own sake
than he would think of associating a theme with Wotan's hat.
Why should a Ring-motif be transformed into the theme repres-
senting Walhalla? Are we to guess that the connexion of ideas
is that Wotan had eventually to pay for Walhalla by the ring?
If we are to the circumstances under which this theme arises,
itspur and development become deep and natural.

Let us illustrate Wagner's mature use of Leitmotiv by the theme
which happens to be associated with Alberich's ring. The fact
that this theme is commonly called the "Ring-motif" is a glaring
instance of what Wagner has had to endure from his friends.
Immediate as the ring is throughout the tetralogy, Wagner would
no more think of associating a theme with it for its own sake
than he would think of associating a theme with Wotan's hat.
Why should a Ring-motif be transformed into the theme repres-
senting Walhalla? Are we to guess that the connexion of ideas
is that Wotan had eventually to pay for Walhalla by the ring?
If we are to the circumstances under which this theme arises,
itspur and development become deep and natural.

The Rhine-daughters have been teasing the Nibelung Alberich,
and are rejoicing in the light of the Rhine-gold which shines at
the top of a rock as the sun strikes it through the water. Alberich does not think much of the gold if its only use is for these waterchildren's games. But one of the Rhine-daughters tells him that “he who could make the gold into a ring would become master of the world,” and to these words the so-called Ring-motif is first sung (see MELODY, Example 11). The Rhine-daughter sings it in a childlike, indolently graceful way which well expresses the kind of toy the ring or the world itself would be to her. One of her sisters in an extremely remote modulation at once takes themselves with the thought that the Rhine-gold is safe, since no one can win it who does not renounce love. Alberich broods over what he hears, and already the theme changes its character as he thinks of such mastery of the world as he might gain by it (MELODY, Ex. 12). He curses love and grasps the gold. The theme of world-mastery grows dark with the darkness of the Nibelung's mind. The waters of the Rhine change into black mists which grow grey and thin, while the now sinister theme becomes softer and smoother. Then it breaks gently forth in a noble, swinging rhythm and massively soft brazen tones, as Wotan awakes on a mountain height and gazing upon Wotan's newly finished palace which he has bid the giants build, so that from it he may rule the world (MELODY, Ex. 13). The theme thus shows no trivial connexion with a stage-property, mechanically important in the plot; but it represents the desire for power, and what that desire means to each different type of mind. The gods, as the giants plaintively admit, “rule by beauty”; hence the “Walhalla-motif.” What it becomes in the mind of the Nibelung is grimly evident when Alberich uses his ring in Nibelheim. The Rhine-daughters' exultant cry of “Rhine-gold!” is then, in common with the music of the whole of the first act, of a very sinister transformation of the theme; and the orchestration, with its lurid but smothered brass instruments, its penetrating low reed tones and its weird drum-roll beaten on a suspended cymbal, is more awe-inspiring than anything dreamed of by the clearest of those composers who do not create intellectual causes for their effects.

A famous and typical instance of Wagner's use of Leitmotif in tragic irony is the passage where Hagen gives Siegfried friendly welcome, to the melody of the curse which Alberich pronounced on the ring and all who approached it. The more subtle examples are innumerable in variety and resource: and perhaps the climax of subtlety is the almost entire absence of Leitmotif in the first scene of the third act of Göttterdammerung, when Siegfried throws away his last chance of averting his doom. The Rhine-daughters appear to him, and ask him to give them the ring that is on his finger. Siegfried refuses. They laugh at his stinginess and disappear. Siegfried is piqued, and calls them back to offer them the ring. Unfortunately they tell him of its curse, and prophesy death to him if he keeps it. This arouses his spirit of contradiction; and he tells them that they might have won it from him by coaxing, but never by threats; and that he values his life no more than the stone he tosses away as he speaks to them. In spite of the necessary allusions to the ominous theme of the curse, which would give any less great composer ample excuse for succumbing to the listener's sense of impending doom, Wagner's music speaks to us through the child-minds of the Rhine-daughters and terrifies us with the ruthless calm of Nature.

Almost as subtle, and much more directly impressive, is the pathos of the death of Siegfried, which is heightened by an unprecedented appeal to a sense of musical form on the scale of the entire tetralogy. Siegfried's whole character and career is, indeed, all高雄; the climactic climax is for this reason an effect of summation; but Shakespeare might have condoned worse plots for the sake of so noble a result; and indeed Wagner's awkwardness arises mainly from fear of committing oversights. Hagen, the Nibelung's son, has managed to make Siegfried unwittingly drink a love-potion with Gutrune, which causes him to forget his own bride, Brünnhilde. Siegfried is then persuaded to transform himself by his magic Tarnhelm into the likeness of his host, Gutrune's brother Gunther, in order to bring Brünnhilde (whose name is now quite new to him) from her fire-encircled rock, so that Gunther may have her for his bride and Siegfried may wed Gutrune. This is achieved; and Brünnhilde's horror and bewilderment at meeting Siegfried again as a stranger in his own shape creates a situation which Siegfried cannot understand, and which Hagen pretends to construe as damning evidence that Siegfried has betrayed Gunther's honour as well as Brünnhilde's. Hagen, Gunther and Brünnhilde therefore agree that Siegfried must die. In order to spare Gutrune's feelings it is arranged that his death shall appear as an accident in a hunting party. While the hunting Siegfried tells stories of his boyhood, thus recalling the antecedents of this drama with a charming freshness and sense of dramatic and musical repose. When he comes to the point where his memory has been clouded by Hagen's spells, Hagen restores his memory with another magic potion. Siegfried calmly continues to tell how he found Brünnhilde asleep on the fiery mountain. Hagen affects to construe this as a confession of guilt, and slays him as if in righteous wrath. The dying Siegfried calls on Brünnhilde to awaken, and asks "Who hath locked thee again in sleep?" He believes that he is once more with Brünnhilde on the Valkyrie's mountain height; and the harmonics of her awaking move in untroubled splendour till the light of life fades with the light of day and the slain hero is carried to the Gleichbung's hall through the moonlit mists, while the music of love and death tells in terrible triumph more of his story than he ever knew.

The bare conception of such art as this shows how perfect is the unity between the different elements in Wagner's later music-drama. If the music of Tristan is more polyphonic than that of Lohengrin, it is because it is hardly figurative to call its drama polyphonic also. Compare the mere fairy-tale mystery of the first act of Parsifal with the intellectual depth of the same name, with the profound fatalism of Isolde's love-potion. Apart from the gain in tragic force resulting from Wagner's masterly development of the character of Brangaene, the raw material of the story was already suggestive of that astounding combination of the contrasted themes of love and death, the musical execution of which involves a harmonic range almost as far beyond that of its own day as the ordinary harmonic range of the 19th century is beyond that of the 16th. In his next work, Die Meistersinger, Wagner ingeniously made poetry and drama out of an explicit manifesto to musical critics, and proved the truth of his music by developing its everyday resources, and showing that its vitality does not depend on that extreme emotional force that makes Tristan und Isolde almost unbearable poignant. Few things are finer in music or literature than the end of the second act of Die Meistersinger, from the point where Sachs's apprentice begins the riot, to the moment when the watchman, frightened at the silence of the moonlit streets so soon after he has heard all that noise, announces eleven o'clock and bids the folk pray for protection against evil spirits, while the orchestra tells us of the dreams of Walther and Eva and ends by putting poetry even into the pedantic ineptitudes of the malicious Beckmesser. Die Meistersinger is perhaps Wagner's most nearly perfect work of art; and it is a striking proof of its purity and greatness that, while the whole work is in the happiest comic vein, no one ever thinks of it as in any way lighter than Wagner's tragic works. The overwhelming love-tragedy of Tristan und Isolde is hardly less perfect, though the simplicity of its action exposes its longueur to greater notoriety than those which may be found in Die Meistersinger.

These two works interrupted the execution of the Ring and formed the stepping-stones to Parsifal, a work which may well be said to close the German symphonic symphony in poetic conception which, as we have seen, gave the determining impulse to Wagner's true musical style. But in music he had no more to learn, and Parsifal, while the most solemn and concentrated of all Wagner's dramas, is musically not always unsuggestive of old age. Its harmonic style is, except in the Grail music, even more abstruse than in Tristan; and the intense quiet of the action is far removed from the forces which in that tumultuous tragedy carry the listener through every difficulty. Again, while the Eucharistic features in Parsifal attract some listeners, the material effect of their presentation
on the stage has been known to repel others who are beyond suspicion of prejudice. But the greatness of the art is, like its subject, worlds away from material impressions; and a wide consensus regards Wagner's last work as his loftiest, both in music and poetry. Certainly no poet would venture to despise Wagner's imaginative conception of Kundry. In his letters to his friend Mathilde Wesendonck, it appears that while he was composing Tristan he already had the inspiration of working out the identification of Kundry, the messenger of the Grail, with the temptress who, under the spell of Klingsor, seduces the knights of the Grail; and he had, moreover, thought out the implications of the imaginary hall of Klingsor, which he described as half conscious of the hero while Kundry is beguiling him with memories of his mother,—and also during the two changes of scene to the Hall of the Grail, where the orchestra mingles the agony of Amfortas and the sorrow of the knights with the tolling of the great bells,—the polyphony is almost as dramatic as in Tristan; while the prelude and the Churfetagszauber are among the clearest examples of the sublime since Beethoven. But else where there are few passages in which the extremely comradic harmonic style can be with certainty traced to anything but habit. This style originated, indeed, in a long experience of the profoundest dramatic impulses; but as a habit it does not seem, like the greatest things in art, the one inevitable treatment of the matter in hand. But, whatever our doubts, we may safely regard Parsifal as a work which, like Beethoven's last fugues, invites attack rather from those critics who demand that flatters their own vanity than from those who wish to be inspired by what they could never have foreseen for themselves.

In Wagner's harmonic style we encounter the entire problem of modern musical texture. Wagner effected vast changes in almost every branch of his art, comprehending, not merely the building and stage-lighting to the musical declamation of words. Most of his reforms have since been intelligently carried out as normal principles in more arts than one; but, shocking as the statement may seem to 20th-century orthodoxy, Wagnerian harmony is a universe as yet unexplored, except by the few composers who are so independent of its bewildering effect on the generation that grew up with it, that they can use Wagner's resources as discreetly as he used them himself. The last two examples at the end of the article on Harmony show almost all that is new in Wagner's harmonic principles. The peculiar art therein is that while the disorders owe their intelligibility and softness to the smooth melodic lines by which in "resolving" they prove themselves but transient rainbow-hues on or below the surface, they owe their strangeness to the intense vividness with which at the moment of impact they suggest a mysteriously remote foreign key. Wagner's orthodox contemporaries regarded such mixtures of key as sheer nonsense; and it would seem that the rank and file of his imitators agree with that view, since they either plagiarize Wagner's actual progressions or else produce such mixtures with no visible intention of melodic or melodic design. If the latter attempt to follow those melodic trains of thought by which Wagner makes sense of them. There is far more of truly Wagnerian harmony to be found before his time than since. It was so early recognized as characteristic of Chopin that a magnificient example may be seen at the end of Schumann's light tone-portrait of him in the Carnaval: a very advanced Wagnerian passage on another principle constitutes the bulk of the development in the first movement of Beethoven's sonata Les Adieux; while even in the "Golden Age" of music, and within the limits of pure diatonic concord, the unexpectedness of many of Palestrina's chords is hardly less Wagnerian than the perfect smoothness of the melodic lines which combine to produce them.

Wagnerian harmony is, then, neither a side-issue nor a progress per saltum, but a leading current in the stream of musical evolution. That stream is sure sooner or later to carry with it every reality that has been reached by side-issues and leaps; and of such things we have important cases in the works of Strauss and Debussy. Strauss makes a steadily increasing use of awedwowed irrational discords, in order to produce an emotionally apt physical sensation. Debussy has this in common with Strauss, that he regards harmonies as pure physical sensations; but he draws forth from Strauss firstly in systematically refusing to regard them as anything else, and secondly in his extreme sensibility to harshness. We have seen (in the articles on Harmony and Music) how harmonic music originated in just this habit of regarding combinations of sound as mere sensations, and how for centuries the habit opposed itself to the intellectual principles of contrapuntal harmony. These intellectual principles are, of course, not without their own ground in physical sensation; but it is evident that Debussy appeals beyond them to a more primitive instinct; and on he basises an almost perfectly coherent and logical system of his harmonies, which are a profound music, precisely the opposite of those of classical harmony. The only illogical point in his system is that the beauty of his dream-like chords depends not only on his artful choice of a timbre that minimizes their harshness, but also on the fact that they enter the ear with the meaning they have acquired through centuries of harmonic evolution on classical lines. There is a special pleasure in the subsidence of that meaning beneath a soothing sensation; but a system based thereon cannot be universal. Its phenomena are, however, perfectly real, and can be observed wherever artistic conditions make the tone of a mass of harmony more important than the interior threads of its texture. This is of constant occurrence in classical pianoforte music, in which thick chords are subjected to polyphonic laws only in their top and bottom notes, while the inner notes make a solid mass of sound in which numerous consecutive fifths and octaves are not only harmless but essential to the balance of tone. In Debussy's art the top and bottom are also involved in the antipolyphonic laws of such masses of sound, thus making these laws paramount.

The irrational discords of Strauss are also real phenomena in musical aesthetics. They are an extension of the principle on which gongs and cymbals and all instruments without notes of determinate pitch are employed in otherwise polyphonic music.

But it is important to realize that both these types of modern harmony are radically non-Wagnerian. Haydn uses a true Straussian discord in The Seasons, in order to imitate the chirping of a cricket; but the harshest realism in Götterdämmerung (the discord produced by the horns of Hagen and his churls in the musing-scene in the second act) has a harmonic logic which would have convinced Corelli. And of Debussy's antipolyphonic art there is less in Wagner than in Beethoven. The present influence of Wagnerian harmony is, then, somewhat indefinite, since the most important real phenomena of later music indicate a revolt both from it and from earlier classical methods. It has had, however, a marked effect on weaker musical individualities. Musical public opinion now puts an extraordinary pressure on the young composer, urging him at all costs to abandon "out-of-date" styles whenever stimulating they may be to his invention. It is no exaggeration to say that a parallel condition in literature would be produced by a strong public opinion to the effect that any English style was hopelessly out of date unless it consisted exclusively of the most difficult types of phrase to be found in the works of Browning and Meredith. The brilliant success of Humperdinck's Hänsel und Gretel, in which Wagnerian technique is applied to the diatonic style of nursery songs with a humorous accuracy undreamed of by Wagner's imitators, points a moral which would have charmed Wagner himself; but until the revival of some rudiments of musical common sense becomes widespread, there is little prospect of the influence of Wagner's harmonic style being productive of anything better than nonsense.
WAGNER—WAGRAM

The very sense of dramatic fitness has temporarily vanished from public musical opinion, together with the sense of musical form. In consequence of this prevalent habit, that of presenting shapeless extracts from Wagner's operas as orchestral pieces without voices or text-books or any hint that such adjacents are desirable. But this vandalism, which Wagner conformed with a very bad grace, now happily begins to give way to the practice of presenting long scenes or entire acts, with the singers, on the concert-platform. This has the merit of bringing the real Wagner to ears which may have no other means of hearing him, and it fosters no delusion as to what is missing in such a presentation. The guidance of Hans Richter has given us a sense of what was possible in the minor key part and to such an extent there is hope that Wagner may yet be saved from such an oblivion in fetish-worship as has lost Handel to us for so long. As with Shakespeare and Beethoven, the day will never come when we can measure the influence of so vast a mind upon the history of art. Smaller artists can make history; the greatest absorb it into that daylight which is its final cause.

LIST OF WAGNER'S WORKS

The following are Wagner's operas and music-dramas, apart from the unpublished Die Hochzeit (three numbers only), Die Feen, and some other works hereafter mentioned.

1. Rienzi, der leite der Tribunen: grosse tragische Oper; 5 acts (1834-1836).
2. Der fliegende Holländer: romantische Oper; 1 act, afterwards cut into 3 (1841).
3. Tannhäuser und der Sängerkrieg auf Wartburg: romantische Oper; 3 acts (libretto, 1843; music, 1841-1845; new Venusberg music, 1863).
4. Lohengrin: romantische Oper; 3 acts (libretto, 1845; music, 1845-1858).
5. Die Walküre: der Ring des Nibelungen, letzter Tag; 3 acts (music completed 1863, first performed 1876).
7. Siegfried: der Ring des Nibelungen, zweiter Tag; 3 acts; the first two nearly finished before Tristan, the rest between 1865 and 1869.
8. Die Meistersinger von Nürnberg; 3 acts (sketch of play, 1845; poem, 1861-1862; music, 1862-1867).
9. Göttämerung: der Ring des Nibelungen, dritter Tag; introduction and 3 acts (Siegfried's Tod already sketched dramatically in 1843; music, 1870-1874).
10. Parsifal: ein Bühnenfestspiel (a solemn stage festival play); 3 acts (music, 1871-1882; Chorfreilangszauber already sketched in 1857).

As regards other compositions, the early unpublished works include a symphony, a cantata, some incidental music to a pantomime, and an overture, a few of which are already lost or destroyed and produced. The important small published works are Eine Faust Overture (1839-1840; rewritten, 1855); the Siegfried Idylle (an exquisite serenade for small orchestra on themes from the finale of Siegfried, written as a surprise for Frau Wagner in 1870); the Kaiser Marsch (1871); the Huldigungsmarsch (1863) for military band; the scoring of the concert-version finished by Raff; Fünf Gedichte (1863), a set of songs containing two studies for Tristan; and the early quasi-oratorio scene for male-voice chorus and full orchestra, Das Liebesmahl der Apostel (1843). Wagner's retouching of Gluck's Iphigenie en Aulide and his edition of Palestine's Sibel Mäster demand mention as important services to music, by no means to be classified (as in some catalogues) with the hack-work with which he kept off starvation in Paris.

Facsimiles of Wagner in German fill ten volumes, and include political speeches, sketches for dramas that did not become operas, autobiographical chapters, aesthetic musical treatises and polemics of vitriolic violence. Their importance will never be comparable to that of his music, but just as the reaction against Ruskin's ascendency as an art-critic has coincided with an increased respect for his ethical and sociological thought so, the rebellious forces that are compelling Wagnerism to grant music a corresponding elevation of rank, will have on a great deal of intellectual powers. The prose works have been translated into English by W. A. Ellis (8 vols., 1862-1869). The translation by F. Jameson (1846-1847) contains the first English rendering of the full scores (the most wonderful tour de force yet achieved in its line. A careful reading of the score to this English text reveals not a single false emphasis or loss of rhetorical point in the fitting of words to music, an achievement of real value in the music which wherever the language seems stilted or absurd the original will be found to be at least equally so, while the spirit of Wagner's poetry is faithfully reflected. Such work deserves more recognition than it is ever likely to get. Rapidly as the standard of musical translations was improving before this work appeared, no one could have foreseen what has now been abundantly verified, that the Ring can be performed in English without any appreciable loss to Wagner's art. The same translator has now published a close, purely literary version. LITERATURE.—The Wagner literature is too enormous to be dealt with here. The standard biography is that of Glaesemann (6 vols., 1844-1859), which appeared between 1844 and 1859; in the English books we may cite Ernest Newman, A Study of Wagner (1899); H. E. Kreibiel, Studies in the Wagnerian Drama (1891); Jesse L. Weston, Legends of the Wagner Dramas (1906). The perceptive Wagnerite, by G. Bernard Shaw, thought concerned mainly with the social philosophy of the Ring, gives a luminous account of Wagner's mastery of musical movement. The highest English authority on Wagner is his friend Dannerthre, whose article in Grove's Dictionary of Music and Musicians (1907) should be consulted. See also Aria, Harmony, Instrumentation, Music, Opera, and Overture. (D. F. T.)

WAGON, or WAGON, a large four-wheeled vehicle for the carriage of heavy loads, and drawn by two or more horses. This is the general English use of the term, where it is more particularly confined to the large vehicles employed in the carrying of agricultural produce. It is also used of the uncovered heavy rolling stock for goods on railways. In America the term is used also to denote wagons which are such as are employed for express delivery, police work, &c., and to various forms of four-wheeled vehicles used for driving, to which the English term "cart" would be given. The word "wagon" appears to be a direct adaptation of Du. Wagen (cf. Ger. Wagen, Swed. Vagn, &c.). Skewt finds the earliest use of the word in Lord Berners's translation of Floskai (1523-1525), so that it is by no means an early word. The O.E. cognate word was wægen, later wagen, by dropping of g (cf. regn, ren, rain), modern "wain." The root of all these cognate words, meaning to carry, is seen in Lat. vehere. The term "wagon" or "wagon" is applied technically in bookbinding to a frame of cane used for trimming the edges of gold leaf. In architecture a "wagon-ceiling" is a boarded roof of the Tudor time, either of semicircular or polygonal section. It is boarded with thin panels of oak or other wood ornamented with mouldings and with loops at the intersections.

WAGRAM (DEUTSCH-WAGRAM), a village of Austria situated in the plain of the Marchfeld, 1 1 m. N.E. of Vienna. It gives its name to the battle of the 5th and 6th of July 1809, in which the French army under Napoleon defeated the Austrians commanded by the archduke Charles. On the failure of his previous attempt to pass his whole army across the Danube at Aspern (see Napoléon Campaigns and Aspern), Napoleon set himself to accumulate, around Vienna and the island of Lobau, not only his own field forces, but also every man, horse and gun available from Italy and South Germany for a final effort. Every detachment was drawn in within forty-eight hours' call, his rearward communications being practically denuded of their covering troops. The island of Lobau itself was converted practically into a fortress, and 150 heavy guns were mounted on its banks to command the Austrian side of the stream. Giving up, in face of this artillery, the direct defence of the river-side, the Austrians drew up in a great arc of about 6 m. radius extending from the Bisamberg, overlooking the Danube, in the west, to Markgrafneusiedl on the east. From this point to the Danube below Lobau a gap was left for the deployment of the archduke Johann's army from Pressburg. This army, however, arrived too late. Their total front, therefore, was about 12 m. for 120,000 men, which by a forward march of a couple of hours could be reduced to about 6 m.—giving a density of occupation of about 20,000 men to the mile.

Meanwhile Napoleon reconstructed the bridge over the main stream (see ASPERN) more solidly, protecting it by palisades of planks and floating booms, and organized an armed flotilla to command the waterway. On the island itself preparations were made to throw three bridges across the Lobau arm of the stream opposite Aspern and Essling, and seven more on the right, facing east between Gross Enzersdorf and the main river.

For several days previous to the great battle the French had sent across small detachments, and hence when, on the afternoon of the 4th of July, an advanced guard was put over near Gross
Enzersdorf, the attention of the Austrians was not particularly attracted and they did not interfere. The emperor, however, had now men available for the battle, and under cover of this detachment his pontoniers made the seven bridges. Long before daylight on the 6th the troops began to stream across, and about 9 A.M. the three corps destined for the first line (Davout, Oudinot and Masséna) had completed their deployment on a front of almost to Aspern, and his right, though aided by Bernadotte, had failed to recapture Aderklaa, from which the Austrians had driven his advanced posts early in the morning. The situation for the French looked very serious, for their troops were not fighting with the dash and spirit of former years. But Napoleon was a master in the psychology of the battlefield, and knew that on the other side things were much the same. He therefore sent orders along the whole line for a gigantic counter-stroke. Davout on the right was to attack Markgrafneusiedl again. Masséna was to move against the troops immediately to his front; Bernadotte and Marmont to advance respectively against Breitenlee and Aderklaa, whilst in the gap which would thus open between them marched the 5th corps (Macdonald) on Süssenbrunn, covered by a battery of 104 guns and followed by the guard and reserve cavalry.

Macdonald formed his 30,000 men in a gigantic hollow square—on a front of one battalion, fourteen battalions deployed at six paces distance leading, whilst the remainder of the infantry marched in column of sections on either flank, and cavalry closed the rear. The idea was to compel even the weakest to go on, on pain of being trapped to death under the feet of the following men and horses, but the terror caused by the Austrian round-shot tearing huge gaps through the mass proved enough to counteract even this danger, and the men in the advance threw themselves down wholesale. It is admitted by French authors (Ardant du Picq) that of the 30,000 only 3000 actually delivered the attack, about 3000 were killed or wounded, but 24,000 evaded their duty somehow, and the trail of the column appeared one mass of dead and dying, creating a terrible impression on all who saw it. Nevertheless, Macdonald reached his destination, for the guns had literally torn a gap in the opposing line, and the guards and cavalry then followed intact. At the same time Davout also had made progress, and, learning that the archduke Johann could not be counted on for that day, the archduke Charles issued orders for a retreat. The whole Austrian army was gradually withdrawn, unbeaten and still available for a renewed offensive if necessary the following day.

The French, however, were in no condition to follow up their advantage. They had seen more of the slaughter than their adversaries, and except the emperor and Davout all seem to have been completely shaken. Even in Davout’s command, always the steadiest in danger, the limit of endurance had been passed, for when about 5 P.M. the advanced patrols of the archduke Johann’s force appeared on their flank, panic on a scale hitherto unknown in the Grande Armée seized the whole right wing, and Napoleon had to confess that no further advance was possible with these men for several days.

Berndt (Zahl im Kriege) gives the following figures. French, 181,700 (including 29,000 cavalry) and 450 guns engaged, of whom 23,000 men were killed and wounded, 7000 missing (16%); 11 guns and 12 eagles and colours were lost. Austrians,
245

WAGTAIL—WALLY

128,000 (including 14,000 cavalry) men and 470 guns engaged; losses, 19,110 killed and wounded, and 6,470 missing (26%); 9 guns and one colour were lost. The casualties in general officers were unusually severe, 21 French and 15 Austrians being killed and wounded.

WAGTAIL (Wagster and Wagstyr), 15th century fide T. Wright, Vol. Vocabularies, i. 221, 253; Urvagale, Turner, 1544, p. 53), the popular name for birds of the subfamily Motacillinae, which, together with the Anthiclna (see Piptr), form the passerine family Motacillidae.

The pied wagtail Motacilla lugubris is a common and generally distributed species in the British Islands, and common throughout northern Europe, but migrating southwards over a relatively narrow range in winter. The white wagtail, M. alba of Linnaeus, has a wide range in Europe, Asia and Africa, visiting England almost yearly, and chiefly differing from the ordinary British in its lighter-coloured tints—the cock especially having a clear grey instead of a black back. Three other species occur in England, but the subfamily with several genera and very many species ranges over the Old World, except Australia and Polynesia, whilst the Asiatic species reach North-West America.

Wagtais are generally parti-coloured birds, frequenting streams and stagnant water, and feeding on seeds, insects, worms, small molluscs and crustaceans. The bill is thin and elongated, and the tail is very long. The nests are made of moss, grass and roots, with a lining of hair and feathers; four to six eggs are laid, bluish white or brown, or yellowish with spots and markings.

The genus Motacilla (an exact rendering of the English "wagtail," the Dutch Kwikstaart, the Italian Codretromola and other similar words), which, as originally founded by Linnaeus, contained nearly all the "soft-billed" birds of early English ornithologists, was restricted by various authors in succession, following the example set by Scopoli in 1760, until none but the wagtails remained in it. The Wagtais include the Wahhabis, a Mahomedan sect, the followers of Muhammad ibn Abdul-Wahhab, who instituted a great reform in the religion of Islam in Arabia in the 18th century. Mohammed ibn 'Abd-ul-Wahhab was born in 1601 (or 1703) at al-Ijauta of the Nejd in central Arabia, and was of the tribe of the Bani Tamim. He studied literature and jurisprudence of the Hanifite school. After making the pilgrimage with his father, he spent some further time in the study of law at Medina, and resided for a while at Isfahan, whence he returned to the Nejd to undertake the work of a teacher. Aroused by his studies and his observation of the luxury in dress and habits, the superstitions, the pilgrimages to shrines, the use of omens and the worship given to Mahomet and Mahomedan saints rather than to God, he began a mission to proclaim the simplicity of the early religion founded on the Koran and Sunna (i.e. the manner of life of Mahomet). His mission in his own district was attended by success, and for long he wandered with his family through Arabia, until at last he settled in Darat'yaya, or Deraiya (in the Nejd), where he succeeded in converting the greatest notable, Mohammed ibn Sa'ud, who married his daughter, and so became the founder of an hereditary Wahhabite dynasty. This gave the mission a perpetuity of following the example of Mahomet himself in extending his religious teaching by force. His instructions in this matter were strict. All unbelievers (i.e. Moslems who did not accept his teaching, as well as Christians, &c.) were to be put to death. Immediate entrance into Paradise was promised to his soldiers who fell in battle, and it is said that each soldier was provided with a written order from Ibn 'Abd ul-Wahhab to the gate-keeper of heaven to admit him forthwith. In this new way the teaching was established in the greater part of Arabia until its power was broken by Mehmet Ali (see Arabia: History). Ibn 'Abd-ul-Wahhab is said to have died in 1707.

The teaching of ul-Wahhab was founded on that of Ibn Taimiyya (1265-1328), who was of the school of Ahmad ibn Hanbal (q.v.). Copies of some of Ibn Taimiyya's works made by ul-Wahhab are now extant in Europe, and show a close study of the writer. Ibn Taimiyya, although a Hanbalite by training, refused to be bound by any of the four schools, and claimed the power of a mujahid, i.e. of one who can give independent decisions. These decisions were based on the Koran, which, like Ibn Hazm (q.v.), he accepted in a literal sense, on the Sunna and Qiyas (analogy). He protested strongly against all the innovations of later times, and denounced as idolatry the visiting of the sacred shrines and the invocation of the saints or of Mahomet himself. He was also a bitter opponent of the Shi'is of his day. The Wahhabites also believe in the literal sense of the Koran and the necessity of deducing one's duty from it apart from the decisions of the four schools. They also pointed to the abuses current in their times as a reason for rejecting the doctrines and practices founded on Ijmii', i.e. the uniform consent of the believer in what he sees as the answers to the problems arising from his complaints (RELIGIONS). They forbid the pilgrimage to tombs and the invocation of saints. The severe simplicity of the Wahhabis has been remarked by travellers in central Arabia. They attack all luxury, loose administration of justice, all laxity against infidels, addiction to wine, impurity and treachery. Under 'Abd ul-Aziz they instituted a form of Bedouin (Bedawi) commonwealth, insisting on the observance of law, the payment of tribute, military conscription for war against the infidel, internal peace and the rigid administration of justice in courts established for the purpose. It is clear that the claim of the Wahhabis to have returned to the earliest form of Islam is largely justified; Burckhardt (vol. ii. p. 132) says, "The only difference between his (i.e. ul-Wahhab's) sect and orthodox Turks, however improperly so termed, is that the Wahabys rigidly follow the same laws which the others neglect or have ceased altogether to observe." Even orthodox doctors of Islam have confessed that in Ibn 'Abd ul-Wahhab's writings there is nothing but what they themselves hold. At the same time the fact that so many of his followers were rough and unthinking Bedouins has led to the over-emphasis of the element of fanaticism or that they often appear to observers to be characterized chiefly by a strictness (real or feigned) in such matters as the prohibition of silk for dress, or the use of tobacco, or of the rosary in prayer.

WAI | 410

WAI, a town in Satara district, Bombay, on the Kistna river. Pop. (1901) 13,060. It is a native of Hindu pilgrimage, with a large, mainly population, the river being lined with temples and bathing ghats. In the neighbourhood are Buddhist caves.

WAIBLEN, a town in Germany, in the kingdom of Württemberg, in the centre of a fruitful vine-growing district on the Rems, 10 m. N.E. from Stuttgart by the main line of railway to Nuremberg via Nördlingen and at the junction of a branch to Hesselstadt. Pop. (1905) 5057. It has two Evangelical churches, one of which is a fine Gothic structure of the 13th century, restored in 1866, a Roman Catholic church and a modern town hall. Its industries, which include the making of pottery and silk, are of considerable importance. The name of Waibingen is mentioned in the 9th century, when it had a palace of the Carolingian sovereigns. Subsequently it belonged to the dukes of Franconia, and gave a surname to the emperor Conrad II. It was in this way that the Hohenstaufen family, which was descended in the female line from Conrad, received the name of Waiblingen, corrupted by the Italians into Ghibelline.

WAILLY, NOËL FRANÇOIS DE (1724-1801), French grammarian and linguist, was born at Amiens on the 31st of July 1724. His life was spent in Paris, where for many years he carried on a school which was extensively patronized by foreigners who wished to learn French. In 1754 he published Précis généraux de la langue française, which revolutionized the teaching of grammar in France. The book was adopted as a textbook by the university of Paris and generally used throughout France, an abstract of it being prepared for primary educational purposes.
In 1771 de Wailly published *Moyens simples et raisonnés de diminuer les imperfections de notre orthographe*, in which he advocated phonetic spelling. He was a member of the Institute from its foundation (1793), and took an active part in the preparation of the *Dictionnaire de l'Académie*. His works, in addition to those cited, include *L'Orthographe des dames* (1791) and *Le Nouveau Vocabulaire français, ou abrégé du dictionnaire de l'Académie* (1801). He died in Paris on the 7th of April 1801.

WAINEWRIGHT, THOMAS GRIFFITHS (1794–1852), English journalist and subject-painter, was born at Chiswick in October 1794. He was educated by his distant relative Dr Charles Burney, and served as an orderly officer in the guards, and as cornet in a yeomanry regiment. In 1819 he entered on a literary life, and began to write for *The Literary Pocket-Book, Blackwood's Magazine* and *The Foreign Quarterly Review*. He was, however, mostly identified with *The London Magazine*, to which, from 1820 to 1823, he contributed some smart but flippant art and other criticisms, under the signatures of "Janus Weathercock," "Egmont Bonmot" and "Herr Vinkboom.

He was a friend of Charles Lamb—who thought well of his literary productions, and in a letter to Bernard Barton, styles him the "kind, light-hearted Wainewright"—and of the other brilliant contributors to the journal. He also practised as an artist, designing illustrations to Chamberlayne's poems, and from 1821 to 1825 exhibiting in the Royal Academy figure pictures, including a "Romance from Ulysses," "Paris in the Chamber of Horrors," and the "Millionaire Sonnet." Over and above his literary and artistic habits, Wainewright's affairs became deeply involved. In 1839 he lost the life of his sister-in-law in various offices for a sum of £18,000, and when she died, in the December of the same year, payment was refused by the companies on the ground of misrepresentation. Wainewright retired to France, was seized by the authorities as a suspected person, and imprisoned for six months. He had in his possession a quantity of strychnine, and it was afterwards found that he had destroyed, not only his sister-in-law, but also his uncle, his mother-in-law and a Norfolkshire friend, by this poison. He returned to London in 1837, but was at once arrested on a charge of forgery, thirteen years before, a transfer of stock, and was sentenced to transportation for life. He died of apoplexy in Hobart Town hospital in 1852.

The *Essays and Criticisms* of Wainewright were published in 1880, with an account of his life, by W. Carew Hazlitt; and the history of certain crimes suggested to Dickens his story of "Hunted Down" and to Bulwer Lytton his novel of *Lusciant*. His passion for art and poetry, and his interest in objects of literature and of art, and his familiarity with the forms that the modern style of writing takes, are suggested by the works of Wainewright.

WAINGA, a river of India, flowing through the Central Provinces in a very winding course of about 360 m. After joining the Wardha the united stream, known as the Phrabi, ultimately falls into the Godavari.

WAINSCOT, properly a superior quality of oak, used for fine panel work, hence such panel-work as used for the lining or covering of the interior walls of an apartment. The word appears to be Dutch and came into use in English in the 16th century, and occurs in lists of imported timber. The Dutch word wagen-schot, adapted in English as wagenskot, wagenskot (Hakluyt, *Voyages*, i. 173, has "books called wageneskot"), was applied to the best kind of oak, well-grained, not liable to warp, as used in construction, from knots. The form shows that it was, in popular etymology, formed from wagen (i.e. wain, wagon) and schot, a term which has a large number of meanings, such as shot, cast, partition, an enclosure of boards, cf. "sheet," and was applied to the fine wood panelling used in coach-building. This is, however, doubted, and relations have been suggested with Dutch weeg, wall, cognate with O. Eng. *wa®h*, wall, or with M. Dutch waeghe, Ger. *Wage*, wave, the reference being to the grain of the wood when cut. The term "wainscot" is sometimes wrongly applied to a "dado," the lining, whether of paper, paint, panelling, *&c.* of the lower portion of the walls of a room. A "dado" (Lat. *dado*, die, cube; Lat. *datum*, something given, a die for casting lots; cf. O. Fr. *de®*, mod. *dé*, Eng. *die* "dye") meant originally the plane-faced cube on the base of a pedestal between the mouldings of the base and the cornice, hence the flat surface between the plinth and the capping of the wooden lining of the lower part of a wall, representing a continuous pedestal.

WAIST, the middle part of the human body, the portion lying between the ribs and the hip-bones, comprising the compressible parts of the trunk. The word is also applied to the central portion of other objects, particularly to the narrowest portion of musical instruments of the violin type and to the centre of a ship. The word appears in the M. Eng. as *wa®se*, "waist of a man’s myddel" (*Prompt. parv. c. 1460*), and is developed from the O. Eng. *wa®st*, growth, the "waist" being the part where the growth of a man is shown and developed; cf. *Icel. verst, stature, shape; Dan. *sa®st, size, growth, &c.* It is thus to be derived from the O. Eng. *wa®xan*, to grow, wax.

WAITE, MORRISON REMICK (1816–1888), American jurist, was born at Lyme, Connecticut, on the 30th of November 1816, the son of Henry Matson Waite (1787–1860), who was judge of the superior court and associate judge of the supreme court of Connecticut in 1834–1854 and chief justice of the latter in 1854–1857. He graduated at Yale in 1837, and soon afterwards removed to Maumee City, Ohio, where he studied law in the office of Samuel L. Young and was admitted to the bar in 1839. In 1850 he removed to Toledo, and he soon came to be recognized as a leader of the state bar. In politics he was first a Whig and later a Republican, and in 1849–1850 he was a member of the state senate. In 1871, with William M. Evarts and Caleb Cushing, he represented the new state of Colorado in the "Alabama" Tribunal at Geneva, and in 1874 he presided over the Ohio constitutional convention. In the same year he was appointed by President U. S. Grant to succeed Judge Salmon P. Chase as chief-justice of the United States Supreme Court, and he held this position until his death at Washington, D.C., on the 23rd of March 1888. In the cases which grew out of the Civil War and Reconstruction, and especially in those which involved the interpretation of the Thirteenth, Fourteenth and Fifteenth amendments, he sympathized with the general tendency of the court to restrict the further extension of the powers of the Federal government. He concurred with the majority in the Head Money Cases (1882), the Ku–Klux Case (*United States v. Harris*, 1882), the Civil Rights Cases (1883) and the *Jaulliard v. Greenman* (legal tender) Case (1883). Among his own most important decisions were those in the Enforcement Act Cases (1875), the Sinking Fund Case (1878), the Railroad Commission Cases (1886) and the Telephone Cases (1887).

WAITHMAN, ROBERT (1764–1853), Lord Mayor of London, was born at Wrexham in 1764. After being employed for some time by a London draper, he purchased a shop of his own, and made a considerable fortune. In 1818 he was returned to parliament, as a liberal, for the city of London. He lost his seat at the election of 1820, but regained it in 1826, and retained it till his death, taking part vigorously in the parliamentary debates, and strenuously supporting reform. In 1823 he was Lord Mayor of London. Waithman died in London on the 6th of February 1833. An obelisk erected by his friends in Ludgate Circus, London, adjoining the site of his first shop, commemorates his memory.

WAITS (A.S. *wa®t, to “wake” or “watch”), the carolling, group, or itinerant musicians who parade the streets at night at Christmas time. The earliest waits (those of the 15th and 16th centuries) were simply watchmen who sounded horns or even played a tune on a flute or flagleot to mark the hours. This appears to have been known as "piping the watch." The black book of the royal household expenses of Edward IV., under date 1478, provides for "a wayte, that nightcly from Mychelmas to Shreve Thorsdaye pipe the watch within this courte fower tymes; in the somere nyghtes three tyme and makte bon gayte at everie chambrer doare and office, as well as byt for tymes of packe and pilere." Elaborate orders as to his housing occur. Thus he was to eat in the hall with the minstrels and was to sup off half a loaf and half a gallon of ale. During his actual attendance at court he was to receive fourpence halfpenny a day or less in the discretion of the steward of the
household. He had a livery given him and during illness an extra allowance of food. Besides "piping the watch" and guarding the palace against thieves and fire, this wait held his post at the installation of knights of the Bath. And in the northern and all the chief boroughs had their corporation waits certainly from the early 16th century, for in the privy purses accounts of Henry VIII. occurs (1532) the entry " Item, the XI daye (of October) paid to the waytes of Canterberie in reward ... vjs. vjd." In 1582 Dudley, earl of Leicester, writes to the corporation of London asking that a servant of his should be admitted to the city waits. These borough waits appear, however, to have been more nearly akin to the medieval troubadours or minstrels who played to kings and nobles at and after the evening meal. The duty of the London wait, which included playing before the mayor during his annual progress through the streets and at city dinners, seem to have been typical of all 16th- and 17th-century city waits. The London waits had a special uniform of blue gowns with red sleeves and caps, and wore a silver collar or chain round the neck. In the 18th and early 19th century the ordinary street watchmen appear to have arrogated to themselves the right to serenade householders at Christmas time, calling round on Boxing Day to receive a gratuity for their tunefulness as well as their watchfulness. When in 1829 their place as guardians of the city's safety was taken by police, it was left for private individuals to keep up the custom.

WAITZ, GEORG (1813-1880), German historian, was born at Flensburg, in the duchy of Schleswig, on the 9th of October 1813. He was educated at the Flensburg gymnasium and the universities of Kiel and Berlin. The influence of Ranke early diverted him from his original purpose of studying law, and while still a student he began that series of researches in German medieval history which was to be his life's work. On graduating at Berlin in August 1836, Waitz went to Hanover to assist J. F. G. Heinrich (1797-1886) at the library. In 1839 he was appointed assistant to the Monarchische Geschichte, and the energy and learning he displayed in this position won him a summons to the chair of history at Kiel in 1842. The young professor soon began to take an interest in politics, and in 1846 entered the provincial diet as representative of his university. His leanings were strongly German, so that he became somewhat obnoxious to the Danish government, a fact which made an invitation in 1847 to become professor of history at Göttingen peculiarly acceptable. The political events of 1848-1849, however, delayed his appearance in his new editorial post. The next year, however, he returned to Göttingen and was named editor of the Akademie der Wissenschaften, while a short time later he was made editor of their Journal der Gesellschaft der Wissenschaften zu Göttingen and of the Beilage zur Göttingischen Landeszeitung. As editor of the Göttingische Landeszeitung, Waitz hastened to place himself at the service of the provisional government. He was sent to Berlin to represent the interests of the duchies there, and during his absence he was elected by Kiel as a delegate to the national parliament at Frankfort. Waitz was an adherent of the party who were eager to bring about a union of the German states under a German emperor; and when the king of Prussia declined the imperial crown the professor withdrew from the assembly in disappointment, and ended his active share in public life. In the autumn of 1849 Waitz began his lectures at Göttingen. His style of speaking was dry and uninteresting; but the matter of his lectures was so practical and his teaching so sound that students were attracted in crowds to his lecture-room, and the reputation of the Göttingen historical school spread far and wide. At the same time Waitz's pen was not idle, and his industry is to be traced in the list of his works and in the Proceedings of the different historical societies to which he belonged. In 1875 Waitz removed to Berlin to succeed Pertz as principal editor of the Monumenta Germaniae Historica. In spite of advancing years the new editor threw himself into the work with all his former vigour, and took journeys to England, France and Italy to collate works preserved in these countries. He died at Berlin on the 24th of May 1886. He was twice married—in 1842 to a daughter of Schelling the philosopher, and in 1858 to a daughter of General von Hartmann.

Waitz is often spoken of as the chief disciple of Ranke, though perhaps in general characteristics and mental attitude he has more affinity with Pertz or Dahlmann. His special domain was medieval German history, and he rarely travelled beyond Germany.

Waitz's chief works, apart from his contributions to the Monumenta, are:—Deutsche Verfassungsgeschichte (8 vols., Kiel, 1844-1878; 2nd ed., 2 vols. only, 1865-1870); Schleswig-Holsteinische Geschichtsquellen (1883); Romulus, das Urbar der Erzherzöge von Ungarn (1886); Liebeck unter Jürgen Wullenwever und die europaische Politik (3 vols.; Berlin, 1855-1856); and Grundzüge der Politik (Kiel, 1862). Among his smaller works, which, however, indicate the line of his researches, are the following:—Jahrbücher des deutschen Reichts unter Heinrich I. (Berlin, 1837, 3rd ed., 1885); Über das Leben und die Lehre des Ulfa (Hanover, 1830); Das alte Recht der sächsischen Franken (Kiel, 1846); Der Kaiser in Karl dem Großen bis Maximilian (Berlin, 1872). In conjunction with his youthful scholar, Dr. L. K. Buerger, he published in the Forschungen zur deutschen Geschichte (Munich, 1862 seq.), and in the Norddeutsche Studien, published in the proceedings of the Schleswig-Holsteinisches historisches Gesellschaft (1844-1853). A Bibliographische Übersicht über Waits's Werke was published by E. Stein dorff at Göttingen in 1886.

Obituary notices of Waitz are to be found in the Historische Zeitschrift, new series, vol. xx.; in the publications for 1886 of the Berlin Akademie der Wissenschaften, the Göttingen Gesellschaft der Wissenschaften, and the Hansischer Geschichtsverein; in the Revue historique, vol. xxxi. 1887; and in the Revue historique, vol. xxxi. 1887.

WAITZ, THEODOR (1821-1864), German psychologist and anthropologist, was born at Gotha on the 17th of March 1821. Educated at Leipzig and Jena, he made philosophy, philology and mathematics his chief studies, and in 1848 he was appointed professor of philosophy in the university of Marburg. He was a severe critic of the philosophy of Fichte, Schelling and Hegel, and considered psychology to be the basis of all philosophy. His researches brought him into touch with anthropology, and he will be best remembered by his monumental work in six volumes, Die Anthropologie der Naturvölker. He died on the 21st of May 1864 at Marburg.

In addition to his Anthropologie, the first four volumes of which appeared at Leipzig, 1859-1864, the last two posthumously, he published Grundlegung der Psychologie (1840); Lehrbuch der Psychologie: der menschlichen Sinnesempfindung (1845); Allemannische Poesie (1852); and a critical edition of the Organon of Aristotle (1844).

WAKE, THOMAS (1297-1340), English baron, belonged to a Lincolnshire family which had lands also in Cumberland, being the son of John Wake (d. 1300), who was summoned to parliament as a baron in 1295, and the grandson of Baldwin Wake (d. 1282), both barons and warriors of repute. Among Thomas Wake’s guardians were Piers Gaveston and Henry, earl of Lincoln, whose daughter Blanche (d. 1357) he married before he was 14. The lady was a ward of Thomas’s uncle, Thomas, earl of Lancaster, and her husband was thus attached to the Lancastrian party, but he did not follow Earl Thomas in the proceedings which led to his death in 1322. Hating the favourites of Edward II, Wake joined Queen Isabella in 1326 and was a member of the small council which advised the young king, Edward III.; soon, however, he broke away from the queen and her ally, Roger Mortimer, and in conjunction with his father-in-law, now earl of Lancaster, he joined the malcontent barons. He was possibly implicated in the plot which cost his brother-in-law, Edmund, earl of Kent, his life in 1330, and he fled to France, returning to England after the overthrow of Isabella and Mortimer. Edward III. made him governor of the Channel Islands and he assisted Edward Bruce to invade Scotland, being afterwards sent on an errand to France. In 1341 he incurred the displeasure of the king and was imprisoned, but he had been restored and had been employed in Brittany and elsewhere when he died childless on the 31st of May 1349. His estates passed to his sister Margaret (d. 1349), widow of Edmund, earl of Kent, and her son John (d. 1352), and later to the Holand family.

Wake published a house for the Austin canons at Newton near Hull; this was afterwards transferred to Halkenmire in the same neighbourhood.

WAKE, WILLIAM (1657-1737), English archbishop, was born at Blandford, Dorset, on the 26th of January 1657, and educated at Christ Church, Oxford. He took orders, and in 1682 went to Paris as chaplain to the ambassador Richard Graham, Viscount Preston (1648-1695). Here he became acquainted with many of
the savants of the capital, and was much interested in French clerical affairs. He also collated some Paris manuscripts of the Greek Testament for John Fell, bishop of Oxford. He returned to England in 1685; in 1688 he became preacher at Gray's Inn, and in 1689 he received a canonry of Christ Church, Oxford. In 1693 he was appointed rector of St James's, Westminster. Ten years later he became dean of Exeter, and in 1705 he was consecrated bishop of Lincoln. He was translated to the see of Canterbury in 1716 on the death of Thomas Tenison. During 1718 he negotiated with leading French churchmen about a projected union of the Gallican and English churches to resist the claims of Rome (see J. H. Lupton, Archbishop Wake and the Project of Union, 1896). In dealing with nonconformity he was tolerant, and even advocated a revision of the Prayer Book that would allay the scruples of dissenters. His writings are numerous, the chief being his State of the Church and Clergy of England...historically deduced (London, 1703). He died at Lambeth on the 24th of January 1736.

Sir Isaac Wake (c. 1580-1632), the diplomatist, was a kinsman of the archbishop. He commenced his diplomatic career in Venice, and returned to England about 1622. By 1636 he was knighted by Charles I. He was British ambassador in Paris from 1630 until his death in June 1632. Among Sir Isaac's writings is Rex Britanniae, a description of the English Church in 1605; this was published in 1607 and has often been reprinted.

Wake (A.S. wacen, to "wake" or "watch"), a term now restricted to the Irish custom of an all-night "waking" or watching round a corpse before burial, but anciently used in the wider sense of a vigil kept as an annual church celebration in commemoration of the completion or dedication of the parish church. This strictly religious wake consisted in an all-night service of prayer and meditation in the church. These services, popularly known as "wakes," were officially termed Vigilae by the church, and appear to have existed from the earliest days of Christianity. The custom was thus analogous to the vigils of the churchyard before the dawn which heralded in a day devoted to feasting, dancing and sports, each parish keeping the morrow of its vigil as a holiday. Wakes soon degenerated into fairs; people from neighbouring parishes journeyed over to join in the merry-making, and as early as Edgar's reign (958-975) the revelry and drunkenness had become a scandal. The vigilae usually fell on Sundays or saints' days, those being the days oftenest chosen for church dedications, and thus the abuse was the more scandalous. In 1445 Henry VI. attempted to suppress mourning wakes, or wakes of lateburiers, but with effect only on the 24th of June, the day of Convocation ordered that the yearly "wake" should be held in every parish on the same day, viz. the first Sunday in October, but this regulation was disregarded. Wakes are specially mentioned in the Book of Sports of James I. and Charles I. among the feasts which should be observed.

Side by side with these church wakes there existed from the earliest times the custom of "waking" a corpse. The custom, as far as England was concerned, seems to have been older than Christianity, and to have been at first essentially Celtic. Doubtless it had a superstitious origin, the fear of evil spirits burring or even removing the body, aided perhaps by the practical desire to keep away rats and other vermin. The Anglo-Saxons called the customlich-wake or like-wake (A.S. lie, a corpse). With the introduction of Christianity the offering of prayer was added to the mere vigil, which until then had been characterized by formal mourning chants and recitals of the life story of the dead. As a rule the corpse, with a plate of salt on its breast, was placed under the table, on which was liquor for the watchers. These private wakes soon tended to become drinking orgies, and during the reign of Edward III. the provincial synod held at London proclaimed by its 30th canon the object of wakes to be the offering of prayer for the dead, and ordered that in future none but near relatives and friends of the deceased should attend. The penalty for disobedience was excommunication. With the Reformation and the consequent disuse of prayers for the dead the custom of "waking" in England became obsolete and died out. Many countries and peoples have been found to have a custom equivalent to "waking," which, however, must be distinguished from the funeral feasts pure and simple.

For detailed accounts of Irish wakes see Brand's Antiquities of Great Britain (W. C. Hazlitt's edition, 1839) and D'Israeli's Irish Wakes.

Wakefield, Edward Gibbon (1796-1862), British colonial statesman, was born in London on the 20th of March 1796, of an originally Quaker family. His father, Edward Wakefield (1774-1854), author of Ireland, Statistical and Political (1812), was a surveyor and land agent in extensive practice; his grandfather, Priscilla Wakefield (1751-1832), was a popular author for the young, and one of the introducers of savings banks. Wakefield was for a short time at Westminster School, and was brought up to his father's profession, which he relinquished on occasion of his elopement at the age of twenty with Miss Pattle, the orphan daughter of an Indian civil servant. The young man and his relatives ultimately became reconciled to the match, and procured him an appointment as attaché to the British legation at Turin. He resigned this post in 1820, upon the death of his wife, to whom he was fondly attached, and, though making some efforts to connect himself with journalism, spent the years immediately succeeding in idleness, residing for the most part in Paris. In 1826 he appeared before the public as the hero of a most extraordinary adventure, the abduction of Miss Ellen Church, daughter of the Reverend Thomas Turner of Shrigley Park, Cheshire. Miss Turner was decoyed from school by means of a forged letter, and made to believe that she could only save her father from ruin by marrying Wakefield, whom she accordingly accompanied to Gretna Green. This time the family refused to condone his proceedings; he was tried with his confederates at Lancaster assizes, March 1827, convicted, and sentenced to three years' imprisonment in Newgate. The marriage, which had not been consummated, was dissolved by a special act of parliament. A disgrace which would have blasted the career of most men made Wakefield a practical statesman and a benefactor to his country. In 1836 his noble effort to introduce the art of flax spinning in India was crowned with success, and he turned his attention while in prison to colonial subjects, and acutely detected the main causes of the slow progress of the Australian colonies in the enormous size of the landed estates, the reckless manner in which land was given away, the absence of all systematic effort at colonization, and the consequent discouragement of immigration and death of labour. He proposed to remedy this state of things by the sale of land in small quantities at a sufficient price, and the employment of the proceeds as a fund for promoting immigration. These views were received with favor, and in 1837 he published a Letter from Sydney (1839), published while he was still in prison, but composed with such graphic power that it has been continually quoted as if written on the spot. After his release Wakefield seemed disposed for a while to turn his attention to social questions at home, and produced a tract on the Punishment of Death, with a terribly graphic picture of the condemned sermon in Newgate, and another on incendiariism in the rural districts, with an equally powerful exhibition of the degraded condition of the agricultural labourer. He soon, however, became entirely engrossed with colonial affairs, and, having impressed John Stuart Mill, Colonel Torrens and other leading economists with the value of his ideas, became a leading though not a conspicuous manager of the South Australian Company, by which the colony of South Australia was ultimately founded. In 1833 he published anonymously England and America, a work primarily intended to develop his own colonial theory, which is done in the appendix entitled "The Art of Colonization." The body of the work, however, is fruitful in seminal ideas, though some statements may be rash and some conclusions extravagant. It contains the distinct proposal that the transport of letters should be wholly gratuitous—the precursor of subsequent reform—and the prophecy that, under given circumstances, "the Americans would raise cheaper corn than has ever been raised." In 1836 Wakefield published the first volume of an edition of Adam Smith, which he did not complete. In 1837 the New Zealand Association was established, and he became its managing director. Scarcely, however, was this great undertaking fairly
commenced when he accepted the post of private secretary to Lord Durham on the latter's appointment as special commissioner to Canada. The Durham Report, the charter of constitutional government in the colonies, though drawn up by Charles Bulter, embodied the ideas of Wakefield. The latter was then a member of its being given to the public through The Times, to prevent its being tampered with by the government. He acted in the same spirit a few months later, when (about July 1839), understanding that the authorities intended to prevent the despatch of emigrants to New Zealand, he hurried them off on his own responsibility, thus compelling the government to allow the country in due time to anticipate a similar step on the part of France. For several years Wakefield continued to direct the New Zealand Company, fighting its battles with the colonial office and the missionary interest, and secretly and patiently encouraging many parliamentary committees on colonial subjects, especially on the abolition of transportation. The company was by no means a financial success, and many of its proceedings were wholly unscrupulous and indefensible; its great object, however, was attained, and New Zealand became the Britain of the south. In 1846 Wakefield, exhausted with labour, was struck down by apoplexy, and spent more than a year in complete retirement, writing during his gradual recovery his Art of Colonization. The management of the company had meanwhile passed into the hands of others, whose sole object was to profit by the company, and profit it was. Wakefield, however, secured the post of secretary, and joined Lord Lyttelton and John Robert Godley in establishing the Canterbury settlement as a Church of England colony. A portion of his correspondence on this subject was published by his son as The Founders of Canterbury (Christchurch, 1868). As usual with him, however, he failed to retain the confidence of his coadjutors to the end. In 1853, after the grant of a constitution to New Zealand, he took up his residence in the colony, and immediately began to act a leading part in colonial politics. In 1854 he appeared in the first New Zealand parliament as extra-official adviser of the acting governor, a position which he retained with great jealousy, and as the mover of a resolution demanding the appointment of a responsible ministry. It was carried unanimously, but difficulties, which will be found detailed in Swainson's New Zealand and its Colonization (ch. 12), prevented its being made effective until after the mover's retirement from political life. In December 1854, after a fatiguing address to a public meeting, followed by prolonged exposure to a south-east gale, his constitution entirely broke down. He spent the rest of his life in retirement, dying at Wellington on the 16th of May 1862. His only son, Edward Jerningham Wakefield (1825-1897), was a New Zealand politician. Three of Wakefield's brothers were also interested in New Zealand. After serving in the Spanish army William Hayward Wakefield (1803-1848) emigrated to New Zealand in 1839. As an agent of the New Zealand Land Company he was engaged in purchasing enormous tracts of land from the natives, but the company's title to the greater part of this was later declared invalid. He remained in New Zealand until his death on the 19th of September 1848. Arthur Wakefield (1799-1843), who was associated with his brother in these transactions about land, was killed during a fight with some natives at Waimea Bay, in the island of Oahu, on the 21st of June 1843. The third brother, Felix Wakefield (1807-1875), an engineer. Wakefield was a man of large views and lofty aims, and in private life displayed the warmth of heart which commonly accompanies these qualities. His main defect was unscrupulousness: he hesitated at nothing necessary to accomplish an object, and the conviction of his untrustworthiness gradually alienated his associates, and left him politically powerless. Excluded from parliament by the fatal error of his youth, he was compelled to resort to indirect means of working out his plans by influencing public men. But for a tendency to paradox, his intellectual powers were of the highest order, and as a master of nervous idiomatic English he is second to Cobbett alone. After every deduction it remains true that no contemporary showed equal genius as a colonial statesman, or in this department rendered equal service to his country.

For an impartial examination of the Wakefield system, see Leroy-Beaulieu, De la colonisation des peuples modernes (3rd ed. pp. 562-575 and 566-700). See also R. Garnett's Life of Wakefield (1893).

WAKEFIELD, GILBERT (1756-1801), English classical scholar and politician, was born at Nottingham on the 22nd of February 1756. He was educated at Jesus College, Cambridge (fellow, 1776). In 1778 in his 22nd year, but in 1853, he accepted the post of classical tutor at the Non-conformist academy at Warrington, which he held till the dissolution of the establishment in 1783. After leaving Warrington, he took private pupils at Nottingham and other places, and also occupied himself with literary work. His most important production at this period was the first part of the Silva critica, the design of which was the "illustration of the Scriptures by light borrowed from the philology of Greece and Rome." In 1790 he was appointed professor of classics at the newly-founded Unitarian college at Hackney, but his proposed reforms and his objection to religious observances led to unpleasantness and to his resignation in the following year. From this time he supported himself by his pen. His edition of Lucretius, a work of high pretensions and little solid performance, appeared in 1790-1799, and gained for the editor a very exaggerated reputation (see Munro's Lucretius, i. pp. 19, 20). His light-hearted criticism of Porson's edition of the Hecuba was avenged by the latter's famous toast: "Gilbert Wakefield; what's Hecuba to him or he to Hecuba?" About this time Wakefield, who hated Pitt and condemned war as utterly unchristian, wrote a little book for the church and state. After assailing with equal bitterness writers so entirely opposed as William Wilberforce and Thomas Paine, in January 1798 he "employed a few hours" in drawing up a reply to Bishop Watson's Address to the People of Great Britain, written in defiance of Pitt and the war and the new "tax upon income." He was charged with having published a seditious libel, convicted in spite of an eloquent defence, and imprisoned for two years in Dorchester gaol. A considerable sum of money was subscribed by the public, sufficient to provide for his family upon his death, which took place on the 9th of September 1801. While in prison he corresponded on classical subjects with Charles James Fox, the letters being subsequently published.

See the second edition of his Memoirs (1804). The first volume is autobiographical; the second, compiled by J. T. Rutt and A. Wainewright, in material estimates drawn from various sources, the most remarkable being one by Dr Parr; see also Gentleman's Magazine (September 1801); Henry Crab's Robinson's Diary (3rd ed., 1872); John Aikin in Ancient General Biography (1799-1815).

WAKEFIELD, a city and municipal and parliamentary borough in the West Riding of Yorkshire, England, 1753 m. N.N.W. from London. Pop. (1901) 41,413. It is served by the Great Northern, Midland and Great Central railways (Westgate station), and the Lancashire and Yorkshire and North-Eastern railways (Kirkgate station), the Great Northern Company using both stations. It lies on the river Calder, mainly on the north bank, in a pleasant undulating country, towards the eastern outskirts of the great industrial district of the West Riding. It has a bridge of eight arches on which stands the chapel of St Mary, a beautiful structure 50 ft. long by 25 wide, of the richest Decorated character. Its endowment is attributed to Edward IV., in memory of his father Richard, duke of York, who fell at the battle of Wakefield (1460). It was completely restored in 1847. In 1888 the bishopric of Wakefield was formed, almost entirely from that of Ripon, having been sanctioned in 1878. The diocese includes about one-seventh of the parishes of Yorkshire, and also covers a very small portion of Lancashire. The cathedral church of the diocese is of very early origin, and the remains of buildings previous to the 14th century can be seen. In the early part of that century the church was almost rebuilt, and was consecrated by Archbishop William de Melton in 1320. Further great alterations took place in the 15th century, and the general effect of the building as it stands is Perpendicular. The church consists of a clerestoried nave and choir, with a western tower; the eastward extension
of the choir, the construction of the retrochoir and other works were undertaken in 1900 and consecrated in 1905 as a memorial to Dr Walsham How, the first bishop. During restoration of the spire (the height of which is 247 ft.) in 1905, records of previous work upon it were discovered in a sealed receptacle in the weathercock. Among the principal public buildings of the town hall (1880), in the French Renaissance style; the county hall (1898), a handsome structure with octagonal tower and dome over the principal entrance; the large corn exchange (1837, enlarged 1862), including a concert-room; the market house, the sessions house, the county offices (1896) and the prison for the West Riding; the mechanics' institution with large library, church institute and library, and the fine art institution. A free library was founded in 1905, and a statue of Queen Victoria unveiled in the Bull Ring at the same time. Benevolent institutions include the Clayall hospital (1879), on the tracery system, and the West Riding pauper lunatic asylum with its branches. The Elizabethan grammar school, founded in 1592, is the principal educational establishment. Among several picturesque old houses remaining, that known as the Six Chimneys, an Elizabethan structure, is the most striking.

Formerly Wakefield was the great emporium of the cloth manufacture in Yorkshire, but in the 19th century it was superseded in this respect by Leeds. Foreign weavers of cloth were established at Wakefield by Henry VII.; and Leland, writing in the time of Henry VIII., states that its white cloth was the most valuable and intimate of the English. In the 18th century it became noted for the manufacture of worsted yarn and woolen stuffs. Although its manufacturing importance is now small in comparison with that of several other Yorkshire towns, it possesses mills for spinning worsted and carpet yarns, coco-nut fibre and China grass. It has also rag-crushing mills, chemical works, soap-works and iron-works; and there are a number of collieries in the neighbourhood. Wakefield is the chief agricultural town in the West Riding, and has one of the largest corn markets in the north of England. It possesses agricultural implement and maceline works, grist and flour mills, malt-works and breweries. A large trade in grain is carried on by means of the Calder, and the building of boats for inland navigation is a considerable industry. There are extensive market-gardens in the neighbourhood. In the vicinity of Wakefield is Walton Hall, the residence of the famous naturalist Charles Waterton (1782-1865). The parliamentary borough returns one member. The municipal borough is under a mayor, 9 aldermen and 27 councillors. Area, 4006 acres.

In the reign of Edward the Confessor, Wakefield (Wakfield) was the chief place in a large district belonging to the king and was still a royal manor in 1086. Shortly afterwards it was granted to William, Earl Warenne, and his heirs, under whom it formed an extensive baronial liberty, extending to the confines of Lancashire and Cheshire. It remained with the Warenne family until the 14th century, when John Warenne, earl of Warenne and Surrey, having no legitimate heir, settled it on his mistress, Maud de Keirford and her two sons. They, however, pre-deceased him, and after Maud's death in 1360 the manor fell to the crown. Charles I. granted it to Henry, earl of Holland, and after passing through the hands of Sir Gervase Clifton and Christopher Keirford, it became property of the Duke of Leeds, ancestor of the present duke, who is now lord of the manor. In 1203-1204 William Earl Warenne received a grant of a fair at Wakefield on the vigil, day and morrow of All Saints' day. As early as 1231 the town seems to have had some form of burghal organization, since in that year a burghage there is mentioned in a fine. In 1331, at the request of John de Warenne, earl of Surrey, the king granted the "good men" of the town pagavge there for three years, and in the same year the earl obtained a grant of another fair there on the vigil, day and morrow of St Oswald. There is no other indication of a borough. The battle of Wakefield was fought in 1460 on the banks of the river Calder just outside the town.

Leland gives an interesting account of the town in the 16th century, and while showing that the manufacture of clothing was the chief industry, says also that Wakefield is "a very quik market town and mostly large, well served of flesh and fish both from sea and by rivers... so that all vitalle is very good and chepe there. A right honest man shall fare well for 2d. a meal... There be plente of se coal in the quarters about Wakefield." The corn market, held on Fridays, is of remote antiquity. A cattle market is also held on alternate Wednesdays under charter of 1765. The town was enfranchised in 1832, and was incorporated in 1848 under the title of the mayor, aldermen and councillors of the borough of Wakefield. Before this date it was under the superintendence of a constable appointed by the steward of the lord of the manor.

Vicar County History, Yorkshire; W. S. Banks, History of Wakefield (1871); E. Parsons, History of Leeds, &c. (1854); J. Taylor, History of Wakefield (1886).

WAKEFIELD, a township of Middlesex county, Massachusetts, U.S.A., about 10 m. N. of Boston. Pop. (1890) 6852; (1900) 9290, of whom 2347 were foreign-born; (1910, census) 11,404. Wakefield is served by three branches of the Boston & Maine railroad and by electric interurban railway to neighbouring towns and cities. It contains the outlying villages of Greenwood, Montrose and Boyntonville; and, larger than these, Wakefield, near the centre of the township. In this village is the town hall, the gift of Cyrus Wakefield (1811-1873), and the Beebe Town Library, founded in 1856 as the Public Library of South Reading, and later renamed in honour of Lucius Beebe, a generous patron. The town park (about 25 acres), shaded by some fine old elms, extends to the S. shore of Lake Quannapowitt and contains a soldiers' monument; and in the S. part of the township are Crystal Lake and Hart's Hill (30 acres), a public park. In the township is the Wakefield Home for Aged Women, and a Y.M.C.A. building. Manufacturing is the principal industry; and among the manufactures are rattan goods, hosery, stove and furnaces, boots and shoes, and pianos. The value of the factory products increased from $2,647,130 in 1900 to $4,807,728 in 1905, or 81.6% of the township owns and operates the electric lighting and gas plants and the water-works.

Within the present limits of Wakefield the first settlement was made, in 1639, in that part of the old township of Lynn which in 1644 was incorporated as Reading. In 1781 the southern or "Old Parish" of Reading, which was strongly Democratic-Republican while the other two parishes were strongly Federalist, was set apart and incorporated as the town of South Reading. In 1868 the present name was adopted in honour of Cyrus Wakefield, who established the ratten works here. A portion of Stoneham was annexed to Wakefield in 1880.

See C. W. Eaton, "Wakefield," in S. A. Drake's History of Middlesex, Massachusetts (1904); Boston Chamber of Commerce.

WAKKERSTROOM, a town and district of the Transvaal. The district occupies part of the S.E. of the Transvaal, being bounded by the Orange Free State and Natal. The frontier line is in part the crest of the Drakensberg. The town of Wakker-\-

stroom, pop. (1904) 1402, lies 18 m. E. of Volksrust and 4 m. N. of the Natal frontier. It is built on the high veld, at an elevation of 5000 ft., and possesses a bracing climate. The neighbouring hills rise over 7000 ft. The plain on which the town stands is drained by the Slang and other tributaries of the Buffalo affluent of the Tugela. The district, a fertile agricultural region, was organized as one of the divisions of the Transvaal in 1878 by President M. W. Pretorius, and after his Christian names the town was called Martinus-Wessel-Stroom, an unwieldy designation dropped in favour of Wakkerstroom. During the war of 1880-81 the town was unsuccessfully besieged by the Boers. In 1903 a small portion of the district was annexed to Natal.

WAKLEY, THOMAS (1705-1862), English medical and social reformer, was born in Devonshire, and was early apprenticed to a Taunton apothecary. He then went to London and qualified as a surgeon, setting up in practice in Regent Street, and marrying Miss Agnes Goodfellow. Goodfellow was a remarkable woman and governor of St Thomas's Hospital. All through his career Wakeley proved to be a man of aggressive personality, and his experiences in this respect had a sensational beginning. In August 1820 a gang of men who had some grievance against him burnt down his
house and severely wounded him in a murderous assault. The whole affair was obscure, and Walæky was even suspected, unjustly, of setting fire to his own houses; but he won his case against the company which contested his claim. He became a friend of William Cobbett, with whose radicalism he was in sympathy. In 1823 he started the well-known medical weekly paper, the Lancet, and began a series of attacks on the jobbery in vogue among the practitioners of the day, who were accustomed to treat the medical profession as a close borough. In opposition to the hospital doctors he insisted on publishing reports of their lectures and exposing various malpractices, and he had to fight a number of lawsuits, which, however, only increased his influence. He attacked the whole constitution of the Royal College of Surgeons, and obtained so much support from among the general body of the profession, now roused to a sense of the abuses he exposed, that in 1827 a petition to parliament resulted in a return being ordered of the public money granted to it. But reform in the college was slow, and Walæky now set himself to rouse the House of Commons from within. He became a radical candidate for parliament, and in 1835 was returned for Finsbury, retaining his seat till 1852. In this capacity, and also as coroner for West Middlesex—an appointment he secured in 1839—he was indubitably in his efforts to advocate humanitarian reforms as well as in pursuing his campaign against medical restrictions and abuses; and he made the Lancet not only a professional organ but a powerful engine of social reform. He died on the 16th of May 1862, leaving three sons, the proprietorship of the Lancet remaining in the family.

See Samuel Squire Sprigge, Life and Times of Thomas Walæky (1897).

**Walachia—Walch**

Walachia, or Walachia, a former principality of southeastern Europe, constituting, after its union with Moldavia on the 6th of November 1859, a part of Roumania (q.v.).

**Walfrid** (from Strabo, i.e. "squint-eyed") (d. 849), German monk and theological writer, was born about 858 in Swabia. He was educated at the monastery of Reichenau, near Constance, where he had for his teachers Tattu and Wettin, to whose visions he devotes one of his poems. Then he went on to Fulda, where he studied for some time under Hrabanus Maurus before returning to Reichenau, of which monastery he was made abbot in 858. There is a story—based, however, on no good evidence—that Walfrid devoted himself so closely to letters as to neglect the duties of his office, owing to which he was expelled from his house by his abbot. But it is said that the real cause of his flight to Spire was that, notwithstanding the fact that he had been tutor to Charles the Bald, he espoused the side of his elder brother Lothair on the death of Louis the Pious in 840. He was, however, restored to his monastery in 842, and died on the 18th of August 849, on an embassy to his former pupil. His epitaph was written by Hrabanus Maurus, whose elegies praise him for being the faithful guardian of his monastery.

Walfrid's Strabo's works are theological, historical and poetical. Of his theological works the most famous is the great exegetical compilation which, under the name of Glosa ordinaria or the Glosa, remained for 500 years the most widespread and important quarry of medieval biblical exegesis. Walfrid's formation, passing from the first twenty psalms (published by Pez in Anedota nova, iv.) and an epitome of Hrabanus Maurus's commentary on Leviticus. An Expositio quattuor Evangeliorum is also attributed to Walfrid. Of singular interest also is his De Deo omnipotente et de creaturis terrae et coelestibus, written between 840 and 842 and dedicated to Regenbert the librarian. It deals in 32 chapters with ecclesiastical usages, churches, altars, prayers, baptism, baptism and the Communion. In it he introduces into his explanations the current German expressions for the things he is treating of, with the apology that Solomon had

1 In the oldest MSS. this is always spelt "Walfríd."

set him by the example of keeping monkeys as well as peacocks at his court. Of special interest is the fact that Walfrid, in his exposition of the Mass, shows no trace of any belief in the doctrine of transubstantiation. According to him, Christ gave to his disciples the sacraments of his Body and Blood in the substance of bread and wine, and taught them to celebrate them as a memorial of his Passion.

Walfrid's principal work is the celebrated Vita sancti Galli, which, though written nearly two centuries after this saint's death, is the primary authority for his life, and a much shorter life of St Oskar, abbot of Reichenau, is in the Monumenta Germaniae historica, Peutæi Latini, ii. (1884), p. 259 ff. Walfrid's poetic works also include a short life of St Blaise, a high-born monk of Lusignan, murdered in 855 by some of the local inhabitants, and a Liber de visionibus Wettini. This last poem, like the two preceding ones written in hexameters, was composed at the command of Father Adalgisus, and based upon the prophecy made by his abbot, abbot of Reichenau from 806 to 822. It is dedicated to Wettin's brother Grimald. At the time he sent it to Grimald Walfrid had, as he himself tells us, hardly passed his eighteenth year, and he begs his correspondent to revise his verses, because, he fears he may be beaten with deserved stripes. In this curious vision Wettin saw Charles the Great suffering paraplegic tortures in Purgatory, an incorrect account of the Roman custom of posthumous stigmatization, which, indeed introduced into the actual text, but "Charolus Imperator" form the initial letters of the passage dealing with this subject. Many of Walfrid's other poetical pieces (e. g. Charles, Louis, Pippin, Judith, &c.) and to friends (Einhard, Grimald, Hrabanus Maurus, Tattu, Ebbo, archbishop of Reims, Drogo, bishop of Metz, &c.). His most famous historical work is the Hortulanus or Hortus, a life of St Bernard, which, though written mainly as a little garden that he used to tend with his own hands, and is largely made up of descriptions of the various herbs he grows there and their medicinal and other uses. Sage holds the place of honour; then comes rue, the antidote of poisons; and so on through melissa, fennel, lilies, poppies, and many other plants, to wind up with the rose, "which in virtue and scent surpasses all other herbs, and may rightly be called the flower of flowers. The curious person who seeks the texts that form the form a dialogue; it was inspired by an equestrian statue of Theodoric the Great which stood in front of Charlemagne's palace at Aix-la-Chapelle.

Walch, Johann Georg (1603-1775), German theologian, was born on the 17th of June 1603 at Meiningen, where his father, Georg Walch, was general superintendent. He studied at Leipzig and Jena, amongst his teachers being J. F. Buddeus (1667-1729), whose only daughter he married. He published in 1716 a work, Historia critica Latinae linguae, which soon came into wide use. Two years later he published an extraordinary book, De fontibus linguæ Latinae, in which he was appointed professor ordinarius of rhetoric, in 1721 of poetry, and in 1724 professor extraordinarius of theology. In 1728 he became professor ordinarius of theology, and in 1750 professor primarius. His theological position was that of a very moderate orthodoxian, which had been influenced greatly by the philosophy and controversies of the Deistic period. His university lectures and published works ranged over the wide fields of church history in its various branches, particularly the literature and the controversies of the church, dogmatics, ethics and pastoral theology. He died on the 13th of January 1775.

His most influential writing was his Bibliotheca theologica (1757-1769); Bibliotheca paixitica (1770, new ed. 1834); his edition of Luther's works in 24 vols. (1740-1752); Historische und theologische Einleitung in die religiösen Streitigkeiten, welche seit der Reformation geistig bewegt, in 3 vols. (1763-1793); the companion work to this, Einleitung in die Religionstreitigkeiten der evang. Kirche (1730-1739), and Philosophisches Lexikon (1726, 4th ed. 1775). His life of Kaiser Joseph II. was published in 6 vols. (1776), and his Leben und Charakter des Kurfürstl. G. J. Walch, was published anonymously by his son C. W. F. Walch (Jena, 1777). Cf. Wilhelm Gass, Protestantische Dogmatik, iii. p. 208 sq.

His son, Johann Ernst, also studied Semitic languages, mathematics, and also natural science and mathematics, and in 1740 he published Einleitung in die Harmonie der Natur. Walfrid also edited Thelma's Life of Louis the Pious, prefixed a preface and making a few additions, and divided Einhard's Vita Caroli into chapters, adding an introduction.
Evangelist, and in 1730 was appointed professor extraordi-
narius of theology. In five years later he became professor
ordinarius of logic and metaphysics in 1751 he exchanged this
for a professorship of rhetoric and poetry. Amongst other
theological works he published Dissertationes in Acta Apostolorum
(1756–1761); Antiquitates symbolicae (1772); and after his death
appeared Observationes in Mathaeum ex Gracice inscriptionibus
(1779). He also published a periodical Der Naturforscher (1774–
1778), and during the years 1749–1756 took an active part in
editing the Zeitschriften of gelehrten Sachen.

See article in Allgemeine deutsche Biographie: also Lebens-
tage der E. I. Walch (Jena, 1803); E. Meusel’s Lexicon der verstorbenen deutschen Schriftsteller, vol. xiv.

Another son, Christian Wilhelm Franz (1726–1784), was
educated at Jena under his father’s direction, and as early as
1745–1747 lectured in the university in branches of exegesis,
philosophy and history. He then travelled with his brother,
J. E. I. Walch, for a year in Holland, France, Switzerland and
Italy. On his return he was in 1750 made professor extra-
ordinarius of philosophy in Jena, but in 1753 he accepted an
invitation to become professor ordinarius at Göttlingen. Here in
1753 the University of Jena appointed extraordinary professors of theology, and three
years later received an ordinary professorship. He lectured on
dogmatics, church history, ethics, polemics, natural theology,
symbolics, the epistles of Paul, Christian antiquities, historical
theological literature, ecclesiastical law and the fathers, and took
an active interest in the work of the Göttinger Societät der Wissen-
schaften. In 1766 he was appointed professor primarius. His
permanent place amongst learned theologians rests on his works
on church history. Semler was much his superior in originality
and boldness, and Mozeim in clearness, method and elegance.
But to him belongs the credit of having delivered to his conscien-
tious and impartial examination of the facts and the authorities at
first hand, and to “his exact quotation of the sources and works
illustrating them, and careful discussion of the most minute
details,” all succeeding historians are indebted. His method is
critical and pragmatic, “pursuing everywhere the exact facts
and the supposed causes of the outward changes of history,”
leaving wholly out of sight the deeper moving principles and
ideas which influence its course. He died on the 10th of March
1784.

His principal work was his Entwurf einer vollständigen
Historie der Ketzereien, Spaltungen, and Religiousreitigkeiten, bis auf
die Zeit der Reformation (11 vols., Leipzig, 1762–1785). Of his other
works, the most important are his late work against the arbitrary
German religion, as a Beweis, dass sie the wahre sei (1753), Entwurf
einer vollständigen Historie der römischen Päpste (1756, 2nd ed.
1758; Eng. trans. 1759), Entwurf einer vollständigen Historie der Kirchen und Kirchenlehrer (1750), Geschichte der Kirchenzucht (1752),
Newen Testamenten (1761, 2nd ed. 1773, 3rd ed. 1792), Bibeldichter
symbolica vetus (1770), Kritische Untersuchung vom Gebrauch der
hälfte Schriften unter den alten Christen (1779), occasioned by
the controversy between G. E. Lessing and J. W. Goethe, and to
Lessing began an elaborate reply just before his death.

On C. W. F. Walch as historian see F. Baer, Epochen der kirch-
lichen Geschichtschreibung (1852), p. 145 sq., and Dogmesgeschichte,
p. 38 sq. (1867, 3rd ed.); W. Goss, Geschichte der protestantischen
Dogmatik. iii, p. 267 sq.; J. G. Meusel, Lexicon verstorbenen deutschen
Schriftsteller, vol. xiv. For his life, see the article in the Allgemeine
deutsche Biographie.

A third son, Karl Friedrich (1734–1790), devoted himself to
the study of law, and became professor of law at Jena in 1759.
His most important works were Introductio in controversias juris
civilis recentioris (Jena, 1771) and Geschichte der in Deutschland
gegründeten Rechten (Jena, 1780). He died on the 20th of July 1799.

WALCOTT, CHARLES DOOLITTLE (1850–
), American
geologist, was born at the village of New York Mills, New
York, on August 2, 1850. He was educated in the common
schools of Utica. In 1876 he was State assistant on the New York
State Survey, and in 1879 assistant geologist on the United
States Geological Survey; in 1888 he became one of the palaeo-
ontologists in charge of the invertebrata, in 1893 chief palaeo-
ontologist, and in 1894 director of the Geological Survey. In
1907 he was appointed Secretary of the Smithsonian Institution.
As president of the Geological Society of Washington he
delivered in 1894 an important address on The United States
Geological Survey. He added largely to contemporary know-
ledge of the fauna of the Old and Palaeozoic rocks of North
America, especially with reference to the crustacea and
brachiopoda; he dealt also with questions of ancient physical
geography and with mountain structure.

His more important works include “Palaeontology of the Eureka
district” (Mon. U.S. Geol. Survey, 1884); “Cambrian faunas of North
America” (U.S. Geol. Survey, 1884); Palaeontology of the Lower
Cambrian or Oleneus Zone (1890, issued 1891) and Fossil Madacas

WALDECK-PYRMONT, a principality of Germany and
a constituent state of the German empire, consisting of
several contiguous portions lying about 30 m. apart, viz. the county of
Waldeck-Pyrmont, of the German principality, the county
of Waldeck-Pyrmont, farther to the north, between Lippe, Brunswick,
Westphalia and Hanover. Waldeck comprises an area of 407 sq.
m., covered for the most part with hills, which culminate in the
Hegekopf (2775 ft.). The centre is occupied by the plateau of
Corbach. The chief rivers are the Eder and the Diemel, both of
which eventually find their way into the Weser. Pyrmont, only 26 sq. m. in extent, is also mountainous. The Emmer,
also belonging to the Weser system, is its chief stream. The
united area is thus 433 sq. m., and about half the size of Cambridge
Weaver in England, and the united population in 1905 was 50,177,
showing a density of 138 to the square mile. The population is
almost wholly Protestant. In consequence of the comparatively
high elevation of the country—the lowest part being 540 ft.
above the sea-level—the climate is on the whole inclement.
Agriculture and cattle-rearing are the main resources of the
inhabitants in both parts of the principality, but the soil is nowhere
very fertile. Only 57% of the area is occupied by arable land
and pasture; forests, one-tenth of which are coniferous, occupy
38%. Oats is the principal crop, but rye, potatoes and flax are
also grown in considerable quantities. Fruit is also cultivated
in the principality. Iron mines, slate and stone quarries are
worked at various points, and, with live stock, poultry, wool
and timber form the chief exports. A few insignificant manufactu-
res are carried on in some of the little towns, but both trade and
manufactures are much retarded by the comparatively isolation
of the country from railways. Wildungen, in the extreme south of
Waldeck, is the terminus of a branch line from Wabern, and
a light railway runs from Warburg to Marburg; Pyrmont is
intersected by the trunk line running from Cologne, via Paderborn,
100 kw., to Hannover.

The capital and the residence of the prince is Arolsen (pop.
2811 in 1905) in Waldeck; twelve smaller townships and about
one hundred villages are also situated in the county. The only
town in Pyrmont is Bad Pyrmont, with about 7500 inhabitants,
a highly fashionable watering-place with chalybeate and saline
springs. The annual number of visitors is about 23,000. Wil-
dungen is also a spa of repute. The inhabitants to the north of
the Eder are of Saxon stock, to the south of Franconian,
difference which is distinctly marked in dialect, costumes and
manners.

Waldeck-Pyrmont has one vote in the federal council (Bundesrat)
and one in the Reichstag. The constitution, dating from 1832, is a reactionary modification of one carried
in 1849, which had been a considerable advance upon one
granted in 1816. The Landtag of one chamber consists of
fifteen members, three of whom represent Pyrmont, elected
indirectly for three years. In the event of the male line of the
present ruling family becoming extinct, the female line will
succeed in Waldeck, but Pyrmont will fall to Prussia. In terms of a treaty concluded between the two states for a
similar period, and continued in 1877 for another ten years, renewed in 1877 for
a similar period, and continued in 1877 for

A possible two years’ notice, the finances and
the entire government of Waldeck-Pyrmont are managed
by Prussia, the little country having found itself unable to support
assisted the military and other burdens involved by its share
in the North German Confederation of 1867–1871 and subsequently
as a constituent state of the German empire. The govern-
ment is conducted in the name of the prince by an
Prussian
WALDECK-ROUSSEAU

"Landesdirector," while the state officials take the oath of allegiance to the king of Prussia. The prince of Waldeck reserves his whole weight as head of the church, and also the right of granting pardons, and in certain circumstances may exercise a veto on proposals to alter or enact laws. Education and similar matters are thus all conducted on the Prussian model; a previous convention had already handed over military affairs to Prussia. The budget for 1910 showed a revenue of £57,000 and a like expenditure. The public debt was £70,710, paying interest at 3 1/2%. The prince is supported by the income derived from crown lands. As regards the administration of justice, Waldeck and Pyrmont belong to the districts of Cassel and Hanover respectively.

The princes of Waldeck-Pyrmont are descendants of the counts of Schwabenberg, the earliest of whom known to history was one Widukind (d. 1137). His son Volkwin (d. 1178) acquired by marriage the county of Waldeck, and his line was divided into two branches, Waldeck and Landau, in 1397. In 1425 the landgrave of Hesse obtained rights of suzerainty over Waldeck, and the claims arising from this action were not finally disposed of until 1847, when it was decided that the rights of Hesse over Waldeck had ceased with the dissolution of the Holy Roman Empire. The Landau branch of the family became extinct in 1519. The other branch, which still exists, holds the county of Pyrmont, which had originally belonged to a branch of the Schwabenberg family. For a few years Waldeck was divided into Wildungen and Eisenberg, but in 1692, when the Wildungen branch died out with George Frederick, the imperial field-marshall, the whole principality was reunited under the rule of Christian Louis of Eisenberg. From 1692 the land has been undivided with the exception of a brief period from 1805 to 1812, when Waldeck and Pyrmont were ruled by two brothers. Frederick Anthony Ulrich (d. 1793), who succeeded his father, Christian Louis, in 1778, married a princess of Brandenburg, and in 1789 Waldeck joined the confederation of the Rhine, and in 1815 entered the German confederation. Its first constitution was granted in 1816 by Prince George II. (d. 1845). Prince Frederick (b. 1856) succeeded his father, George Victor (1831-1893), as ruler on the 12th of May 1893. The most important fact in the recent history of the principality is its connexion with Prussia, to which reference has already been made.

Hoffmeister, Historisch-genealogisches Handbuch über alle Grafen und Fürsten von Waldeck seit 1228 (Cassel, 1883); Böttcher, Das Staatsrecht des Fürstentums Waldeck (Freiburg, 1884); A. Wagner, Die Geschichte Waldecks und Pyrmonts (Wildungen, 1903), and the Geschichtsblätter für Waldeck und Pyrmont (Mengeringhausen, 1901, 1st.).

WALDECK-ROUSSEAU, PIERRE MARIE RENÉ ERNEST (1846-1904), French statesman, was born at Nantes on the 2nd of December 1846. His father, René Waldeck-Rousseau (1809-1883), a barrister at Nantes and a leader of the local republican party, figured in the revolution of 1848 as one of the deputies returned to the Constituent Assembly for Loire Inférieure. With Jules Simon, Louis Blanc and others he sat on the commission appointed to inquire into the labour question, making many important proposals, one of which, for the establishment of national banks, was partially realized in 1850. After the election of Louis Napoleon to the presidency he returned to his practice at the bar, and for some time after the coup d'État was in hiding to escape arrest. He came back to political life in the crisis of 1870, when he became mayor of Nantes in August and proclaimed the third republic there on the 4th of September. He shortly afterwards resigned municipal office in consequence of differences with his colleagues on the education question.

The son was a delicate child whose defective eyesight forbade him the use of books, and his early education was therefore entirely oral. He studied law at Poitiers and in Paris, where he took his licentiate in January 1860. His father's record ensured his reception in high republican circles. Jules Grévy stood sponsor for him at the Parisian bar, and he was a regular visitor at the houses of Stanislas Dufaure and of Jules Simon. After six months of waiting for briefs in Paris, he decided to return home and to join the bar of St Nazaire, where he resided his name early in 1870. In September he became, in spite of his youth, secretary to the municipal commission temporarily appointed to carry on the town business. He organized the National Defence at St Nazaire, and himself marched out with the contingent, though no part of the force saw active service owing to lack of ammunition, their private store having been commandeered by the state. In 1873 he removed to the bar of Rennes, and six years later was returned to the Chamber of Deputies. In his electoral programme he had stated that he was prepared to respect all liberties except those of conspiracy and institutional religion, and was in this last he stood in hatred of the modern social order. In the Chamber he supported the policy of Gambetta. The Waldeck-Rousseau family was strictly Catholic in spite of its republican principles; nevertheless Waldeck-Rousseau supported the anti-clerical education law submitted by Jules Ferry as minister of education in the Waddington cabinet. He further voted for the abrogation of the law of 1814 forbidding work on Sundays and fête days, for compulsory service of one year for seminarians and for the re-establishment of divorce. He made his reputation in the Chamber by a report which he delivered in 1880, in which, after the committee was prepared to inquire into the French judicial system, he said as later he was chiefly occupied with the relations between capital and labour. He had a large share in 1884 in securing the recognition of trade unions. In 1885 he became minister of the interior in Gambetta's grand ministre, and he held the same portfolio in the Jules Ferry cabinet of 1883-1885, when he gave proof of great administrative powers. He sought to put down the system by which civil posts were obtained through the local deputy, and he made it clear that the central authority could not be defied by local officials. He had begun to practise at the Paris bar in 1886, and in 1888 he did not seek re-election to the Chamber, but devoted himself to his legal work. The most famous of the many noteworthy cases in which his cold and penetrating intellect and his power of clear exposition were retained was the defence of M. de Lesseps in 1893. In 1894 he returned to political life as senator for the department of the Loire, and next year stood for the presidency of the republic against Félix Faure and Henri Brisson, being supported by the Conservatives, who were soon to be his bitter enemies. He received 184 votes, but retired before the second ballot to allow Faure to receive an absolute majority. During the next few years he was recognized by the moderate republicans as the successor of Jules Ferry and Gambetta, and at the crisis of 1890 on the fall of the Dupuy cabinet he was asked by President Loubet to form a government. After an initial failure he succeeded in forming a coalition cabinet which included such widely different politicians as M. Millerand and General de Galliflet. He himself returned to his former post at the ministry of the interior, and set to work to quell the discontent with which the country was seething, to put an end to the various agitations which under specious pretences were directed against him, and to restore independence to the central authority. His appeal to all republicans to sink their differences before the common peril met with some degree of success, and enabled the government to leave the second court-martial of Captain Dreyfus at Rennes an absolutely free hand, and then to compromise the affair by granting a pardon to Dreyfus. Waldeck-Rousseau won a great personal success in October by his successful intervention in the strikes at Le Creusot. With the condemnation in January 1900 of Paul Déroulède and his monarchist and nationalist followers by the High Court, he fought the worst of the danger was past, and Waldeck-Rousseau kept order in Paris without having recourse to irritating displays of force. The Senate was staunch in support of M. Waldeck-Rousseau, and in the Chamber he displayed remarkable astuteness in winning support from various groups. The Amnesty Bill, passed on 19th December, chiefly through his unwearied advocacy, went far to smooth down the acerbity of the preceding years. With the object of aiding the industry of wine-producing, and of
discovering the consumption of spirits and other deleterious liquors, the government passed a bill suppressing the octroi duties on the three "hygienic" drinks—wine, cider and beer. The act came into force at the beginning of 1901. But the most important measure of his later administration was the Associations Bill of 1901. Like many of his predeccessors, he was convinced that the stability of the republic demanded some restraint on the intrigues of the wealthy religious bodies. All previous attempts in this direction had failed. In his speech in the Chamber M. Waldeck-Rousseau recalled the fact that he had endeavoured to pass an Associations Bill in 1882, and again in 1892. He declared that the religious associations were now being subjected for the first time to the regulations common to all others, and that the object of the bill was to ensure the supremacy of the civil power. The royalist bias given to the pupils in the religious seminaries was undoubtedly a principal cause of the passing of this bill; and the government further took strong measures to secure the presence of officers of undoubted fidelity to the republic in the higher positions on the staff. His speeches on the religious question were published in 1901 under the title of Associations et congrégations, following a volume bearing the title Questions sur ces associations (1901). The election of 1902 approached all sections of the Opposition united their efforts, and M. Waldeck-Rousseau's name served as a battle-cry for one side, and on the other as a target for the foulest abuse. The result was a decisive victory for republican stability. With the defeat of the machinations against the republic M. Waldeck-Rousseau considered his task ended, and on the 3rd of June 1902 he resigned office, having proved himself the "strongest personality in French politics since the death of Gambetta." He emerged from his retirement to protest in the Senate against the construction put on his Associations Bill by M. Coureau, who refused in mass meetings of the teaching and preaching congregations for official recognition. His health had long been failing when he died on the 10th of August 1904.

His speeches were published as Discours parlementaires (1889); Pour la république, 1883-1903 (1904), edited by H. Leryet; L'État et la liberté (1906); and his Plaidoyers (1906, &c.) were edited by H. Barboux. See also H. Leryet, Waldeck-Rousseau et la troisième république (1908), and the article France: History.

WALDEGRAVE, the name of an English family, taken from its early residence, Walgrave in Northamptonshire. Its founder was SIR RICHARD WALDEGRAVE, of Walgrave, who was member of Parliament for Lincolnshire in 1335; his son, Sir Richard Waldegrave (d. 1400), was a very obscure personage, and of Willesden in Middlesex.

One of Sir Richard's descendants was Sir Edward Waldegrave (c. 1517-1561) of Borley, Essex, who was imprisoned during the reign of Edward VI. for his loyalty to the princess, afterwards Queen Mary. He was knighted, and he received from her the manor of Chemoton in Somerset, now the residence of Earl Waldegrave. He was a member of parliament and chancellor of the duchy of Lancaster. After Mary's decease he suffered a reverse of fortune, and he was a prisoner in the Tower of London when he died on the 1st of September 1561. Sir Edward's descendant, another Sir Edward Waldegrave, was created a baronet in 1643 for his services to Charles I.; and his descendant, Sir Henry Waldegrave, Bart. (1660-1689), was created Baron Waldegrave of Chevton in 1686. Sir Henry married Henrietta (d. 1730), daughter of King James II. and Arabella Churchill, and their son was James, 1st Earl Waldegrave (1684-1741).

Educated in France, James Waldegrave soon crossed over to England, and under George I. he declared himself a Protestant and took his seat as Baron Waldegrave in the House of Lords. Highly recommended by Sir Robert Walpole, he was sent to Paris as ambassador extraordinary in 1725, and from 1727 to 1730 he was British ambassador at Vienna. In 1729 he was created Viscount Chevton and Earl Waldegrave, and in 1730 he succeeded Sir Horatio Walpole as ambassador in Paris, filling this post during ten very difficult years. He died on the 11th of April 1741. Much of his diplomatic correspondence is in the British Museum.

His son James, the 2nd earl (1715-1763), was perhaps the most intimate friend of George II., and was for a time governor of his grandson, the future king George III. He was very much in evidence during the critical years 1755-1757, when the king employed him to negotiate in turn with Newcastle, Devonshire, Pitt and Fox about the formation of a ministry. Eventually, in consequence of a deadlock, Waldegrave himself was first lord of the treasury for five days in June 1757. He died on the 28th of April 1763, leaving some valuable and interesting Memoirs, which were published in 1821.

His brother John, the 3rd earl (1718-1784), was a soldier, who distinguished himself especially at the battle of Minden and again at Jemappes; he was in every way a general in 1741.

His younger son, William Waldegrave (1752-1825), entered the British navy in 1766, and after many years of service was third in command at the battle of Cape St Vincent in 1797. In 1800 he was created an Irish peer as Baron Radstock, and in 1802 he became an admiral. His son, George, Granville, 2nd Baron Radstock (1786-1857), followed in his father's footsteps, and was made a vice-admiral in 1851. In 1857 his son, Granville Augustus William (b. 1833), became 3rd Baron Radstock.

The 4th Earl Waldegrave (1751-1789), the eldest son of the 3rd earl, was a soldier and a member of parliament. His sons, George (1784-1794) and John James (1785-1835), were the 5th and 6th earls. In 1797 the 6th earl inherited from Horace Walpole his famous residence, Strawberry Hill, Twickenham, but his son, George Edward, the 7th earl (1816-1846), was obliged in 1842 to sell the valuable treasures collected there. His wife, Frances, Countess Waldegrave (1821-1859), a daughter of the singer John Braham, was a prominent figure in society. She was his second husband, and after his death she married George Granville Vernon Harcourt of Nuneham Park, Oxfordshire, and later Chichester Fortescue, Baron Carlingford.

The 7th earl was succeeded by his uncle William (1788-1859), a son of the 4th earl, and in 1859 William's grandson, William Frederick (b. 1831), became the 9th earl.

WALDEN, ROGER (d. 1466), English prelate, was a man of obscure birth, little or nothing, moreover, being known of his early years. He had some connexion with the Channel Islands, and resided for some time in Jersey; and he held livings in Yorkshire and in Leicestershire before he became archdeacon of Winchester in 1387. His days, however, were by no means passed in peace. He was acting with the traces of his other positions in this neighbourhood. In 1395, after having served Richard II. as secretary, Walden became treasurer of England, adding the deanship of York to his numerous other benefices. In 1397 he was chosen archbishop of Canterbury in succession to Thomas Arundel, who had just been banished from the realm, but he lost this position when the new king Henry IV. restored Arundel in 1399, and after a short imprisonment he passed into retirement, being, as he himself says, "in the dust and under feet of men." In 1403, through Arundel's influence, he was elected bishop of London, and he died at Much Hadham in Hertfordshire on the 6th of January 1406. An Historia Mundi, the manuscript of which is in the British Museum, is sometimes regarded as the work of Walden; but this was doubtless written by an earlier writer.

WALDENBURG, a town of Germany, in the Prussian province of Silesia, 39 m. S.W. of Breslau by the line to Hirschberg and Görlitz. Pop. (1905) 16,455. It contains a handsome town hall, three prominent and two Roman Catholic churches. Waldenburg lies in the centre of the productive coal district of the Waldenburger Gebirge, a branch of the Sudetic chain, and its inhabitants are largely occupied in the mining industry. Among other industrial establishments are a large porcelain and earthenware factory, extensive fireclay works, glassworks and a china-painting establishment; there are also numerous flax-spinners and linen-factories in the neighbourhood. Adjoining the town on the south is the village of Oberwaldenburg, pop. (1905)
The Waldenses. The Waldensian valleys lie to the south-west of Turin, in the direction of Monte Viso, but include no high
or snowy mountains, while the glens themselves are (with one
or two exceptions) fertile and well wooded. The principal town
near the valleys is Pinerolo (Pignolo). Just to its south-west
there opens the chief Waldensian valley, the Val Pellice,-watered
by the stream of that name, but sometimes called inaccurately
the Luserna valley, Luserna being simply a village opposite
the capital, Torre Pellice; near Torre Pellice the side glens of
Angroina and Rora join the Pellice valley. To the north-west
of Pinerolo, up the Chisone valley, there opens at Pevero Argentina
the valley of St Martin, another important Waldensian
valley, which is watered by the Germanasca torrent, and at
Perrero splits into two branches, of which the Prali glen is far
more fertile than that of Masselio, the latter being the wildest
and most savage of all the Waldensian valleys.

The name Waldenses was given to the members of an heretical
Christian sect which arose in the south of France about 1170.
The history of the sects of the middle ages is obscure, because
the earliest accounts of them come from those who were con-
cerned in their suppression, and were therefore eager to lay
upon each of them the worst enormities which could be attrib-
uted to it. Later times the apologists of each sect reversed the
process, and cleared that in which they were interested at
the expense of others. In early times these sectaries produced
little literature of their own; when they produced a literature
at the beginning of the 15th century they attempted to claim for
it a much earlier origin. Hence there is confusion on every
side; it is difficult to distinguish between various sects and
to determine their exact opinions or the circumstances under
which they came into being. The polemical conception which has
done much to perpetuate this confusion is that of the historical
continuity and the same teaching from Constantine to the
present day of 1100, when Pope Sylvester gained the first temporal
possession for the papacy, and so began the system of a rich,
powerful and worldly church, with Rome for its capital. Against
this secularized church a body of witnesses silently protested;
they were always persecuted but always survived, till in the
13th century a desperate attempt was made by Innocent III.
to root them out from their stronghold in southern France.
Persecution gave new vitality to their doctrines, which passed
on to Wycliffe and Huss, and through these leaders produced
the Reformation in Germany and England.

This view rests upon a series of suppositions, and is entirely
unhistorical. So far as can be discovered the heretical sects
of the middle ages rested upon a system of Manichaeism which
was imported into Europe from the East (see MANICHAEISM).
The Manichaean system of dualism, with its severe asceticism,
and its individualism, which early passed into antinomianism,
was attractive to many minds in the awakening of the 11th
century. Its presence in Europe can be traced in Bulgaria soon
after its conversion in 865,1 where the struggle between the Eastern
and Western churches for the new converts opened a way for the
more hardy speculations of a system which had never
entirely disappeared, and found a home amongst the
Paulicians (9th) in Armenia. The name of Cathari (see CATHARI),
taken by the adherents of this new teaching, sufficiently shows
the Oriental origin of their opinions, which spread from Bulgaria
amongst the Slavs, and followed the routes of commerce into
central Europe. The earliest record of their presence there is
the condemnation of ten canons of Orleans as Manichaeans in 1122,
and soon after this we find complaints of the prevalence of heresy
in northern Italy and in Germany. The stronghold of these
heretical opinions were the great towns, the centres of
civilization, because there the growing sentiment of municipal
independence, and the rise of a burgher class through commerce,
created a spirit of criticism which was dissatisfied with the
worldly lives of the clergy and their undue influence in affairs.

The system of Catharism recognized two classes of adherents,
credentes and perfecti. The perfecti only were admitted to its
esoteric doctrines and to its superstitious practices. To the
ordinary men it seemed to be a reforming agency, insisting on a
high moral standard, and upholding the words of Scripture
against the traditions of an overgrown and worldly church. Its
popular aim and its rationalistic method made men overlook
its real contents, which were not put clearly before them. It
may be said generally that Catharism formed the abiding
background of medieval heresy. Its dualistic system and its
anti-social principles were known only to a few, but its anti-
eclesiastical organization formed a permanent nucleus round
which gathered a great deal of political and ecclesiastical dis-
content. When this discontent took any independent form of
expression, zeal, which was not always accompanied by dis-
cretion, brought the movement into collision with the ecclesi-
astical authorities, by whom it was condemned as heretical.
When once it was in conflict with authority it was driven to
strengthen its basis by a more pronounced hostility against the
system of the church, and generally ended by borrowing some-
thing from Catharism. The result was that in the beginning of
the 13th century there was a tendency to class all bodies of
heretics together: partly their opinions had coalesced; partly
they were assumed to be identical.

Most of these sects were stamped out before the period of the
middle ages came to a close. The Waldenses, under their more
modern name of the Vaudols, have survived to the present
day in the valleys of Piedmont, and have been regarded as at
once the most ancient and the most evangelical of the medieval
sects. It is, however, by no means easy to determine their
original tenets, as in the 13th and 14th centuries they were a
body of obscure and unlettered peasants, hiding themselves
in a corner, while in the 16th century they were absorbed into
the general movement of the Reformation. As regards their
antiquity, the attempts of Waldo claim for them an earlier origin than
that of the Waldenses, which can no longer be sustained. They
rested upon the supposed antiquity of a body of Waldensian
literature, which modern criticism has shown to have been
tampered with. The most important of these documents, a
poem in Provençal, "La Nobla Leyczun," contains two lines
which claimed for it the date of 1100:

Ben ha mil e cent anez compli enteant
Que lo scripcas l' ora, car sen al deicr temp.

But it was pointed out2 that in the oldest MS. existing in the
Cambridge university library the figure 4 had been imperfectly
written, and the word "cent" a discovery which harmonized
with the results of a criticism of the contents of the poem itself.
This discovery did away with the ingenious attempts to account
for the name of Waldenses from some other source than from
the historical founder of the sect, Peter Waldo or Valdez.
To get rid of Waldo, whose date was known, the name Waldenses
or Vaulens was derived from Vails, because they dwelt in the
valleys, or from a supposed Provençal word Vaudes, which
meant a sorcerer.

Putting these views aside as unsubstantial, we will consider
the relation of the Waldenses as they appear in actual history,
which preceded them. Already in the 9th century there were
several protests against the rigidity and want of
spirituality of a purely sacerdotal church. Thus Bercangar
of Tours (1009-1088) upheld the symbolic character of the Eucharist
and the superiority of the Bible over tradition. The Paterines
in Milan (1045) raised a protest against simony and other abuses
of the clergy, and Pope Gregory VII. did not hesitate to enlist
their Puritanism on the side of the papacy and make them his
allies in imposing clerical celibacy. In 1110 an apostate monk
in Zeeland, Tanchelm, carried their views still farther, and
asserted that the sacraments were only valid through the merits
and sanctity of the ministers. In France, at Embrun, Peter de
Bruys founded a sect known as Petrobrusians, who denied infant
baptism, the need of consecrated churches; transubstantiation,
and masses for the dead. A follower of his, a monk, Henry, gave the name to another body known as Henricians, who centred in Tours. The teachers of these new opinions were men of high character and holy lives, who in spite of persecution wandered from place to place, and made many converts from those who were dissatisfied at the want of clerical discipline which followed upon the struggle for temporal supremacy into which the reforming projects of Gregory VII. had carried the church.

It was at this time (1170) that a rich merchant of Lyons, Peter Waldo, sold his goods and gave them to the poor; then he went forth as a preacher of voluntary poverty. His followers, the Waldenses, or paupers of Lyons, were moved by a religious feeling which could find no satisfaction within the actual system of the church, as they saw it before them. Like St Francis, Waldo adopted a life of poverty that he might be free to preach, but with this difference that the Waldenses preached the doctrine of Christ while the Franciscans preached the person of Christ, Waldo reformed teaching while Francis kindled love; hence the one awakened antagonisms which the other escaped. For Waldo had a translation of the New Testament made into Provençal, and his preachers not only stirred up men to more holy lives but explained the Scriptures at their own will and in their own way, with the result that the ecclesiastical authorities were led to difficulties. Pope Alexander III., who had approved of the poverty of the Waldensians, prohibited them from preaching without the permission of the bishops (1179). Waldo answered that he must obey God rather than man. The result of this disobedience was excommunication by Lucius III. in 1184. Thus a reforming movement became heresy through disobedience to authority, and after being condemned embarked on a course of polemical investigation how to justify its own position. Some were readmitted into the Catholic Church, and one, Durandus de Osca (1216), attempted to found an order of Pampers Catholic, which was the forerunner of the order of St Dominic. Many were swept away in the crusade against the Albigensians (q.v.). Others made an appeal to Innocent III., protesting their orthodoxy. Their appeal was not successful, for they were formally condemned by the Lateran council of 1215.

The earliest definite account given of the Waldesian opinion is that of the Inquisitor Sacconi about 1250. He divides them into two classes: those north of the Alps and those of Lombardy.

The first class hold (1) that oaths are forbidden by the gospel, (2) that capital punishment is permitted to the civil power, (3) that any layman may consecrate the sacrament of the altar, and (4) that the Roman Church is not the Church of Christ. The Lombard sect went farther in (3) and (4), holding that no one in mortal sin could consecrate the sacrament, and that the Roman Church was the scourge woman of the Apocalypse, whose precepts ought not to be obeyed, especially those appointing fast-days. This account sufficiently shows the difference of the Waldenses from the Cathari: they were opposed to asceticism, and had no official priesthood; at the same time their objection to oaths and to capital punishment are closely related to the principles of the Cathari. Their other opinions were forced upon them by their conflict with the authority of the Church. When forbidden to preach without the permission of the bishop, they were driven to assert the right of all to preach, without distinction of age or sex. This led to the further step of setting up personal merit rather than ecclesiastical ordination as the ground of the priestly office. From this followed again the conclusion that obedience was not due to an unworthy priest, and that his ministrations were in no way of divine institution. These opinions were subversive of the system of the medieval church, and were naturally viewed with great disfavour by its officials; but it cannot fairly be said that they have much in common with the opinions of the Reformers of the 16th century. The medieval church set forth Christ as present in the orderly community of the faithful; Protestantism aimed at setting the individual in immediate communion with Christ, without the mechanical intervention of the officers of the community; the

Waldenses merely set forward a new criterion of the orderly arrangement of the church, according to which each member was to sit in judgment on the works of the ministers, and consequently on the validity of their ministerial acts. It was a rude way of expressing a desire for a more spiritual community. The earliest known document proceeding from the Waldensians is an account of a conference held at Bergamo in 1218 between the Ultramontane and the Lombard divisions, in which the Lombards showed a greater opposition to the recognized priesthood than did their northern brethren.

As these opinions became more pronounced persecution became more severe, and the breach between the Waldenses and the church widened. Waldo withdrew altogether from the ministrations of the church, and chose ministers for the churches whose merits were recognized by the body of the faithful. Election took the place of ordination, but even here the Lombards showed their difference from the Ultramontanes, and recognized only two orders, like the Cathari, while the northern body kept the old three orders of bishops, priests and deacons. Gradually the separation from the church became more complete: the sacraments were regarded as merely symbolical; the priests became helpers of the faithful; ceremonies disappeared; and a new religious society was set up, equally unlike the medieval church and the Reformation churches of the west and east.

The spread of these heretical sects led to resolute attempts at their suppression. The crusade against the Albigensians could destroy prosperous cities and hand over lands from a heedless lord to one who was obedient to the church; but it could not get rid of heresy. The revival of preaching, which was the work of the order of St Dominic, did more to combat heresy, especially where its persuasions were enforced by law. The work of inquisition into cases of heresy proceeded slowly in the hands of the bishops, who were too busy with other matters to find much time for sitting in judgment on theological points about which they were imperfectly informed. The greatest blow struck against heresy was the transference of the duty of inquiry into heresy from the bishops to Dominican inquisitors. The secular power, which shared in the proceeds of the confiscation of those who were found guilty of heresy, was ready to help in carrying out the judgments of the spiritual courts. Everywhere, and especially in the district round Toulouse, heretics were keenly prosecuted, and before the continued zeal of persecution the Waldenses slowly disappeared from the chief centres of population and were driven to the remote inaccessible valleys of the Alps. There, in the recesses of Piedmont, where the streams of the Pelice, the Angroigne, the Clusone and others leave the sides of the Alps into valleys which converge at Susa, a settlement of the Waldensians was made who gave their name to these valleys of the Vaudois. In the more accessible regions north and south heresy was exposed to a steady process of persecution, and tended to assume shifting forms. Among the valleys it was less easily reached, and retained its old organization and its old contents. Little settlements of heretics dispersed throughout Italy and Provence looked to the valleys as a place of refuge, and tacitly regarded them as the centre of their faith. At times attempts were made to suppress the sect of the Vaudois, but the nature of the country which they inhabited, their obscurity and their isolation made the difficulties of their suppression greater than the advantages to be gained from it. However, in 1487 Innocent VIII. issued a bull for their extermination, and Albert no de' Capitani, archdeacon of Cremona, put himself at the head of a crusade against them. Attacked in Dauphiné and Piedmont at the same time, the Vaudois were hard pressed; but luck, owing to the assistance of a few men of distraction upon their chief refuge in the valley of the Angroigne, and were repulsed with great loss. After this Charles II., Duke of Piedmont, interfered to save his territories from further confusion, and promised the Vaudois peace. They were, however, sorely reduced by the onslaught which had been made upon them, and lost their ancient spirit of independence. When the Lutheran movement began they were ready to sympathize with it, and ultimately to adapt their old

2 Pueger, Beiträge zur Geschichte der Waldesier.
beliefs to those of the rising Protestantism. Already there were scattered bodies of Waldenses in Germany who had influenced, and afterwards joined, the Hussites and the Bohemian Brethren.

The last step in the development of the Waldensian body was taken in 1530, when two deputies of the Vaudois in Dauphiné and Provence, Georges Morel and Pierre Masson, were sent to confer with the German and Swiss Reformers. A letter addressed to Oecolampadius1 gives an account of their practices and beliefs at that time, and shows us a simple and unlettered community, which was the survival of an attempt to form an esoteric religious society within the medieval church. It would appear that its members received the sacraments of baptism and the holy communion from the regular priesthood, at all events sometimes, but maintained a discipline of their own and held services for their own edification. Their ministers were called barba, a Provençal word meaning guide. They were chosen from among labouring men, who, at the age of twenty-five might ask the body of ministers to be admitted as candidates. If their character was approved they were taught during the winter months, when work was slack, for a space of three or four years; after that they were sent for two years to serve as menial assistants at a nunnery for women, which curiously enough existed in a recess of the valleys. Then they were admitted to office, after receiving the communion, by the imposition of hands of all ministers present. They went out to preach two by two, and the junior was bound absolutely to obey the senior. Clerical celibacy was the rule, but they permitted those who required it to partake of the national law of divorce. The ministers received food and clothing from the contributions of the people, but also worked with their hands; the result of this was that they were very ignorant, and also were grasping after bequests from the dying. The affairs of the church were managed by a general synod held every year. The duties of the barbas were to visit all within their district once a year, hear their confessions, advise and admonish them; in all services the two ministers sat side by side, and one spoke after the other. In point of doctrine they acknowledged the seven sacraments, but gave them a symbolical meaning; they prayed to the Virgin and saints, and admitted, in part at least, to the sacrament of confession, but they denied purgatory and the sacrifice of the mass, and did not observe fasts or festivals. After giving this account of themselves they ask for information about several points in a way which shows the exigencies of a rude and isolated society; and finally they say that they have been much disturbed by the Lutheran teaching about free-will and predestination, for they had held that men did good works through natural virtue stimulated by God's grace, and they thought of predestination in no other way than as a part of God's foreknowledge. The removal of this great objection further emphasizes the wrongfulness of their outward submission to the ordinances of the church: "God," he said, "is a jealous God, and does not permit His elect to put themselves under the yoke of Antichrist." The result of this intercourse was an alliance between the Vaudois and the Swiss and German Reformers. A synod was held in 1532 at Chanforans in the valley of the Angrogne, where a new confession of faith was adopted, which recognized the doctrine of election, assimilated the practices of the Vaudois to those of the Swiss congregations, renounced for the future all recognition of the Roman communion, and established a separate Church, which was allowed to hold meetings of a faithful few but as public assemblies for the glory of God.

Thus the Vaudois ceased to be relics of the past, and became absorbed in the general movement of Protestantism. This was not, however, a source of quiet or security. In France and Italy alike they were marked out as special objects of persecution, and the Vaudois church has many records of martyrdom. The most severe trial to which the Vaudois of Piedmont were subjected occurred in 1655. The Congregation de Propaganda Fide established, in 1650, a local council in Turin, which exercised a peculiar jurisdiction over the Vaudois, and deprived Bishop L., who was bishop of this district until the age of twenty-six, of his see. But the Vaudois was employed for this purpose, and his famous sonnet is but the condensation of his state papers. Sir Samuel Morland was sent on a special mission to Turin, and to him were confided by the Vaudois leaders copies of their religious books, which he brought back to England, and ultimately gave to the university library at Cambridge. Large sums of money were contributed in England and elsewhere, and were sent to the suffering Vaudois.

By this demonstration of opinion was made for a time between the Vaudois and their persecutors; but it was a treacherous peace, and left the Vaudois with a hostile garrison established among them. Their worship was prohibited, and their chief pastor, Leger, was obliged to flee, and in his exile at Leiden wrote his Histoire générale des églises vaudoises (1684). The revocation of the edict of Nantes in 1685 began a new period of persecution, which aimed at entire extermination. This was found so difficult that the remnant of the Vaudois, to the number of 2600, were at last allowed to withdraw to Geneva. But the love of their native valleys was strong among the exiles, and in 1686 one of their pastors, Henri Arnaud, led a band of 800 men to the reconquest of their country. His first attempts against the French were successful, and the provinces of Savoie, Amadeus, duke of Savoy, and Louis XIV, brought a sudden change of fortune to the Vaudois. They were recognized once more as citizens of Savoy, and in the war against France which broke out in 1696 the Vaudois regiment did good service for its duke. The peace of Utrecht saw the greater part of the French territory occupied by the Vaudois annexed to Savoy, and, though there were frequent threatenings of persecution, the idea of toleration slowly prevailed in the policy of the house of Savoy. The Vaudois, who had undergone all these vicissitudes, were gradually reduced to poverty, and their ministers were partially maintained by a subsidy from England, which was granted by Queen Anne. The 18th century, however, was a time of religious decadence even among the Alpine valleys, and the outbreak of the French Revolution saw the Vaudois made subjects of France. This led to a loss of the English subsidy, and they applied to Napoleon for an equivalent. This was granted, and their church was organized by the state. On the restoration of the house of Savoy in 1816 English influence was used on behalf of the Vaudois, who received a limited toleration. From that time onwards the Vaudois became the objects of much interest in Protestant countries. Large sums of money were collected to build hospitals and churches among their valleys, and they were looked upon as the possible centre of a Protestant church in Italy. Especially from England did they receive sympathy and help. An English clergyman, Dr. Gilly, visited the valleys in 1823, and by his writings on the Vaudois church attracted considerable attention, so that he was enabled to build a college at La Torre. Moreover, Dr. Gilly's book (A Visit to the Valleys of Piedmont), chasing into the hands of an officer who had lost his leg at Waterloo, Colonel Beckwith, suggested an object for the energies of General Wellington, who was keen on the age of twenty-six to sink into enforced idleness. Beckwith visited the valleys, and was painfully struck by the squalor and ignorance of a people who had so glorious a past. He settled among them, and for thirty-five years devoted himself to promote their welfare. During this period he established no fewer than 120 schools; moreover he brought back the Italian language which had been displaced by the French in the services of the Vaudois church, and in 1849 built a church for them in Turin. He lived in La Torre till his death in 1862, and the name of the English benefactor is still revered by the simple faces of the valley.

The parent church in the valleys is ecclesiastically governed by a court for internal affairs called the "Table," after the old
stone table round which the ancient barbaras used to sit, and a mission board, with an annual syndow to which both the home and mission boards are subject. The total population of the Wal- densian valleys (for they also contain Roman Catholics in no small number) amounts to about 20,000 all told. In 1900 there were 16 parish churches, 11 parochial schools, and 2 Sunday schools (3017 children) and 194 day schools (with 4218 children); the full members (i.e. communicants) of the Wal- densian faith amounted to 12,605. There were, besides, branches at Turin (1 temple, 2 pastors and 750 members), in other parts of Italy, including Sicily (46 temples and as many pastors, while the number of members was 5613, of day scholars 2704, and of Sunday school scholars 3702). It is also reckoned that in Uruguay and the Argentine Republic there are about 6000 Waldensians; of these 1253 were in 1900 full members, while the day scholars numbered 364 and the Sunday school children 679.

The literature on the subject of the Waldensian and other sects is copious. For their rise the most important authorities are to be found in Moneta, Adversus Catharos et Waldenses; D’Argenté, Collectio judiciorum de novis erroribus; Alman, Adversus haereses; D’Achery, Spicilegia, vol. 1; Gretser, Opera, vol. x.; Limborch, Historia Inquisitionis, at the end of which is the Liber sententiarum of the Inquisition of Toulouse from 1307-1322. Of modern books mention may be made of: Schmidt, Hahn, Geschichte der neumanchiischen Ketzer; Dieckenhoff, Die Waldenser im Mittelalter; Preger, Beiträge zur Geschichte der Waldenser; Canti, Gli Eretici in Italia e nel mondo in generale (1907); Fribourg, Heilige Geist, 2 vol.; T. Reclus, Histoire des frères de l’Amour; Zucco, Storia dei ultime e dei Vaudi; M. Schmidt, Zeitschrift für evangelische Kirchenrecht. Among books dealing with the more modern history of the Vaudois specially are Leger, Histoire des églises vaudoises; Arnaud, Histoire de la rentrée des Vaudois; Perrin, Histoire des Vaudois; Monastier, Histoire de l’église vaudoise; Musson, L’Etrang des Alpes; Gilly, Excursion to the Valleys of Piedmont, and Researches on the Waldenses; Todd, The Waldensian Manuscripts; Melia, Origin, Persecution and DOctrines and of the Waldenses; Jules Chevalier, Mémoires sur les hérésies en Dauphiné en 1321; Fribourg, Réformes en Italie et les Vaudois (Valence, 1890); J. A. Chabrand, Vaudois et Protestantism des Alpes: recherches historiques (Grenoble, 1886); H. Haupt, article in Von Sybel’s Historische Zeitschrift (1886), pp. 59-66; W. A. B. Coolidge, articles in the Guardian for 19th August 1886 and 4th December 1889.

WALDENSEE, ALFRED, COUNT (1832-1904), Prussian general field marshal, came of a soldier family. Entering the Guard Artillery of the Prussian army in 1850, he soon attracted the favourable notice of his official superiors, and he made his first campaign (that of 1866) as aide-de-camp to General of Artillery Prince Charles of Prussia, with whom he was present at Königgrätz. In the course of this campaign Count Waldersee was promoted to the rank of major. After conclusion of the peace he served on the staff of the X. Army Corps (newly formed from the conquered kingdom of Hanover). In January 1870 he became military attaché at Paris and aide-de-camp to King William. In the Franco-German War Lieut.-Colonel Count Waldersee, on account of both his admitted military talents and his recent experience of the enemy’s army, proved a most useful assistant to the “supreme War-Lord.” He was present at the great battles around Metz, in which he played more than an orderly officer’s part, and in the war against the republic he was specially sent to the command of the staff of the grand army of the North, which was operating against Chancy’s army on the Loir. The grand duke was a good soldier, but not a brilliant strategist, and the fortunate outcome of the western campaign was largely due to his adviser. At the end of the war Waldersee received the First Class of the Iron Cross, and was entrusted with the exceedingly delicate and difficult post of German representative at Paris, in which his tact and courtesy were very marked. At the end of 1871 Waldersee took over the command of the 13th Ulians at Hanover, and two years later he became chief of the staff of the Hanoverian army corps, in which he remained until 1878, when he became principal assistant on the great general staff at Berlin, and for seven years was intimately connected with the great field marshal’s work, so that, when Moltke retired in 1888, Waldersee’s appointment to succeed him was a foregone conclusion. Three years later the chief of the general staff was sent to command the IX. Corps at Altona, an appointment which was interpreted as indicating that his close and intimate friendship with Bis- mark had made him, at this time of the chancellor’s dismissal, a persona non grata to the young emperor. In 1898, however, he was appointed inspector-general, at the west of the army of inspection” at Hanover, the order being accompanied by the most eulogistic expressions of the Kaiser’s goodwill. On the despatch of European troops to quell the Boxer insurrection in China in 1900, it was agreed that Count Waldersee should have the supreme command of the joint forces. The preparations for his departure from Germany caused a good deal of satirical comment on what was known as the “Waldersee Rummel” or “theatricals.” He arrived at the front, however, too late to direct his troops in the fighting before Peking. At the end of the war he returned to Germany. He resumed his duties of inspector-general, which he performed almost to his death, which took place on the 5th of March 1904.

WALDO, SAMUEL LOVETT (1783-1861), American artist, was born in Windham, Connecticut, on the 6th of April 1783. He had a studio in Charleston, South Carolina. In 1806 he went to London, where he painted portraits for some years with success. In 1809 he returned to New York, and was a conspicuous figure in the city’s art life until his death there on the 16th of February 1861. He became an associate of the National Academy in 1847. Among his works are a series of portraits of the notable members of the Van Vorst family, and a portrait of Peter Renssen, in possession of the New York Historical Society, and two portraits of John Trumbull.

WALENSEE, also called the LAKE OF WALENSESTADT, a Swiss lake between the basins of the Rhine and the Linth (Limmat), lying S.E. of the Lake of Zürich. It is formed by the Seez river (descending from the Weisstannen gletscher), which once certainly sent its waters to the Rhine, but now enters the lake at its eastern end. Near its western end the Linth has been diverted through the Escher canal (completed in 1811) into the lake, from which it soon again issues in order, by means of the Linth canal (completed in 1816), to flow into the Lake of Zürich. The Walensee has an area of 9 sq. m., is about 9 m. in length, 1½ m. wide and 495 ft. deep, while its surface is 1388 ft. above sea-level. It forms part of the Canton of St Gall, save 1½ sq. m. towards its west end, which are in that of Glarus. It lies in a deep trench between two comparatively lofty ranges of mountains, so that its scenery is more gloomy than is usual with Swiss lakes. On the north shore there is but a single village of any size (Quinten), while above it rise the cliffs of the seven- bordered Dauphine, which is the present of the canton of the same name. A little below the lake, and nestling in a hollow high above the lake, on the south side the hills rise less steeply from the shore (which are Mükelenhorn and Murg) towards the fine terrace of the Kerenzenberg, on which are the frequent summer resorts of Obstalden and Filzbach, backed on the south by the singularly imposing crags of the Mürschnekenstock (8012 ft). The small towns of Wiesen and Walenstadt are situated respectively at the western and the eastern extremities of the lake, a railway along the south shore of which connects them with each other (1½ m.). Since the construction of this line no steamers run from them to the city of Zürich.

WALES (Cymru, Gwalia, Cambria), a Principality occupying the extreme middle-west of the southern part of the island of Great Britain, bounded E. by the English counties of Cheshire, Shropshire, Herefordshire and Monmouthshire; S. by the Bristol Channel; W. by St George’s Channel; and N. by the Irish Sea. (For map see England, V.) Its area is 7467 sq. m. Its greatest length from N. to S. (from the Point of Air in Flint to Barry Island on the Glamorgan coast) is 136 m., while its breadth varies from 92 m. (from St Dogmaels Head to the English Channel) to 37 m. (the distance between Aberystwyth and the Shropshire boundary at Clun Forest). Its total circuit is about 540 m., of which 300 consist of coast- line. The principal headlands are Great Ormes Head; in Carnarvonshire; Braich-y-Pwll, the most westerly point of
Carnarvonshire; St Davids Head, the most westerly point of South Wales; Worms Head, the western extremity of Gower; and Lavernock Point to the W. of Cardiff. The principal islands are Holy Island, off the W. coast of Anglesea; Bardsey (Ynys Enlli), near Brach-y-Pwll; and the islands of Ramsey, Grassholm, Skomer, Skokholm and Caldy (Ynys Pyr) off the Pembroke-shire coast. The chief inlets are the Mouth of the Dee, dividing Flint from Cheshire; the Menai Straits, separating Anglesea from the mainland; Carnarvon Bay; Cardigan Bay, stretching from Brach-y-Pwll to St Davids Head; St Brides Bay; Milford Haven; Carmarthen Bay; and Swansea Bay.

The boundaries of the counties for judicial purposes are laid down as follows: the Principality is divided into North Wales and South Wales, each of which consists of six counties.

**North Wales.**

**Mountains.**—Almost the whole surface of Wales is mountainous or undulating. The most important hill system is that of the North Wales mountains, covering the county of Carnarvon and parts of Merioneth and Denbigh, wherein the Snowdonian range reaches the height of 3,571 ft. in Snowdon, 3,438 ft. in Carnedd Llywelyn, and of 3,242 ft. in Carnedd Dafydd. South of this system, and separated by it from the upper valley of the Dee, the Berwyn range extends from N. to S.E., and is itself adjacent to Aran-fawdwy (2995 ft.) on the highest lands of the Cadair Idris group. The system of mid-Wales or Powys stretches from Cardigan Bay to the English border, and contains Plynlimon (2462 ft.) in north Cardigan; Dyfi (2370 ft.) in north Brecon; and Rheidw Llyn (2163 ft.) in mid-Radnor. From Plynlimon a range of hills runs in a south-easterly direction towards St Davids, terminating in the Preseli range of north Pembroke (1750 ft.) and dividing the broad valleys of the Teifi and Towy. The combined range of the Black Mountains, the Brecknock Beacons and the Black Forest sweep across south Brecon from W. to E., the chief elevations being the Carmarthen Van (2623 ft.), the Brecon Beacon (2682 ft.) and Pen-y-gabler fawr (2660 ft.) near the English border.

**Lakes and Rivers.**—Small lakes, such as Llyn Ogwen, Llyn Saffadan (Llangorse Lake), Talyllyn, the Teifi Pools, &c., are fairly numerous in the mountainous districts, but the only natural lake of importance is Bala Lake, or Llyn Tegid, in Merionethshire, 4 m. long and about 1 m. wide. But the great reservoir known as Lake Vyrnwy, which supplies Liverpool with water, is equal in size to Bala; and the chain of lakes from the source of the Birmingh. makers in the valley of the Elan and Claerwen covers a large area in west Radnorshire. The longest river in Wales is the Severn (180 m.), in Welsh Hafren, which rises in Plynlimon, and takes a northward course through Montgomeryshire before reaching the English border. The Wye (130 m.) also rises in Plynlimon, and forms for some 30 m. the boundary between the counties of Radnor and Brecon before encountering English soil near Hay. The Usk (56 m.) flows through Breconshire, and joins the Bristol Channel at Newport in Monmouthshire. The Dee (70 m.) traverses Bala Lake, and drains parts of the counties of Merioneth, Denbigh and Flint. It enters Carnarvonshire entering Carnarvon Bay at Llanstephan; the Teifi (50 m.) rises near Tregaron and falls into Cardigan Bay below the town of Cardi- gan. The Taf (50 m.) runs from Cardigan Bay to the Towy (25 m.), entering Carmarthen Bay at Laugharne; and the broad navigable Conway (2m.), dividing the counties of Carnarvon and Denbigh.

**Welsh Place-Names.**—The place-names throughout the Principality may be said to group themselves roughly into four divisions: (i) Pure and unaltered Celtic names; (ii) Corrupted or abbreviated Celtic names; (iii) English names; (iv) Scandinavian and foreign names. To the first division belong the vast majority of place-names throughout the whole of Wales and Monmouthshire. Except in some districts of the Marches and in certain tracts lying along the South Wales coast, nearly all parishes, villages, hamlets, farms, houses, woods, fields, streams and valleys possess native appellations, which in most cases are descriptive of natural situation, e.g. Nant-y-ffyn, the boundary brook; Aberporth, mouth of the harbour; Tal-y-bont, end of the bridge; Treweryn, foot of the hill; Duffryn, a valley; &c. Certain place-names are for natural features, e.g. Nant-y-gôr, the blacksmith’s brook; Treffeca, the house of Rebecca; Llysgen Madoc, Madoc’s grove; Pont-saeson, the Saxons’ glen, &c. An historical origin is frequently commemorated, notably in the many foundations of the Celtic missionaries of the 6th, 7th and 7th centuries, wherein the word llan (church) precedes a proper name; thus every Llanddew recalls the early labours of Dewi Sant (St David); every Llanddona, those of St Teilo; and such names as Llandudno, Llanfanog, Llanbadarn and the like commemorate SS. Tudno, Afan, Paradarn. The names of the ancient towns which have been corrupted by English usage—belong most of the old historic towns, in striking contrast with the rural villages and parishes, which in nearly all cases have retained unaltered their original Celtic names. Anglicized in spelling and even to some extent changed in sound are Carmarthens (Caerfyrddin); Pembroke (Penbro); Kidwelly (Cydweiti; Cardifi (Caerdydi); Llandvery (Llanymddyfi); while Lampeter, in Welsh Llande- pont-Stephen, affords an example of a Celtic place-name both Anglicized and abbreviated. In not a few instances modern English nomenclature has supplanted the old Welsh place-names in popular usage, although the town’s original appellation is retained in Welsh literature and conversation, e.g. Holyhead is Caergybi (fort of Cybi, a Celtic missionary of the 6th century); Presteigne is Llandradas (church of St Andrew, or Andras); St Asaph is Llandewi; the English name commemorating the reputed founder of the see, and the Welsh name recalling the church’s original foundation on the banks of the Elwy. Cardigan, in Welsh Aberteifi, from its situation near the mouth of the Teifi, and Brecon, in Welsh Aberhonddu, from its site near the confluence of the Usk and Avon, are instances of English Welsh names in common use—Ceredigion, Brychan—which possess in addition pure Celtic forms. In the third division, English place-names are tolerably frequent everywhere and predominate in the Marches and on the South Wales coast. Even in so thoroughly Welsh a county as Cardiganshire, English place-names are often to be encountered, e.g. New Quay, High Mead, Oakford, &c.; but many of such names are of modern invention, dating chiefly from the 18th and 19th centuries. Of the many English names occurring in south Pembroke and south Glamor- gan, some are exact or fanciful translations of the original Welsh, e.g. Cambridge (Pant-y-fon) and Ludgkirk (Eglwyseg Llwyd), others are of direct external origin, as Bishopstone, Flemingstone, Butter Hill, Briton Ferry, Manselfield, &c. Names derived straight from an Anglo-Norman source are rare; Beaupré, Beaumaris, Beaufort, Fleur-de-lis, Roche, may be cited as examples of such. Scandinavian influence can easily be traced at various points of the coast-line, but particularly in south Pembroke, wherein occur such place-names as Caldy, Tenby, Goodwick, Dale, Skokholm, Hakin and Milford Haven. Speci- fically Romanized names, those ending in -acum, are especially common in the counties of Carmarthen and Cardigan; there are preserved in Strata Florida and Vale Crucis Abbeys. Hybrid place-names are occasionally to be met with in the colonized portions of Wales, as in Gelliswick (a combination of the Celtic gellt, a hazel grove, and the Norse wick, a haven), and in Fletherhille, where the English suffix hill is practically a translation of the Celtic prefix. A striking peculiarity of the Principality is the prevalence of Scriptural place-names; a circumstance due undoubtedly to the popular religious movements of the 19th century. Not only are such names as Horeb, Zion, Peniel, Siloh, &c., bestowed on Nonconformist chapels,
but these Biblical terms have likewise been applied to their surrounding houses, and in not a few instances to growing towns and villages. A notable example of this curious nomenclature occurs in Bethesda, Carnarvonshire, where the name of the Congregational chapel erected early in the 19th century has altogether supplanted the original Celtic place-name of Ciloden. But although English and foreign place-names are fairly numerous throughout Wales, yet the vast majority remain Celtic either in a pure or corrompt form, so that some knowledge of the Celtic language is essential to interpret their meaning.

A small glossary of some of the more common component words is appended below.

Aber, the mouth or estuary of a river—Aberystwyth, Abergwy.
Afon, a river—Afon Clasych, Afon Conwy.
Alwen, a brook—Alwen, Afon Tal-y-llwyf, Alynwyl.
Alwen, a bend—Afon Llwyf, Afon Tal-y-llwyf.
Afon, a river—a word which retains its primitive meaning in Wales, whilst it has become a proper name in England—Glanalon, Manon.
Bettws, a corrupt form of the English "bed-house," or possibly of the Latin "beatus"—Betws-y-coed, Bettws Ynys.
Blan, the top—Blaendyfrig, Blaencwm.
Bod, a house or abode—Hoffan, Hafod.
Brym, the human breast, hence breast of hill—Brongest, Citronnau.
Bryn, a hill—Brynmaur, Penbyr.
Butch, a gap—Butch-y-foel, Tanyhen.
Caed, a field—Caeglas, Tynycaw.
Caer, a fortress or fortified camp—Caerleon, Caersws.
Capel, a corrupt form of the Latin "capella," applied to chapels, ancient and recent—Capel Dewi, Capel-y-capel.
Carn, a cairn or heap of stones—Moel-trigarn.
Carred, a tumultus—Carred Llywelyn.
Cefn, a ridge—Cefn-Mably, Cemyn-y-bedd.
Chl, a retreat, said to be akin to the Goddelic kil—Cilall-Aeron, Cilennon.
Cnoc, a knoll or mound—Cuwglas (Anglicized into Knocklas, in Radnorshire).
Coed, a wood—Coedmawr, Penycoed.
Craig, a rock or crag—Pen-y-graig.
Crig, a heap or barrow—Craig Mawr, Trichfgrg.
Cum, a low valley, Anglicized into "coum"—Cwm Gweddraeth, Blaencwm.
Din, a fortified hill, hence Dinus, a fortified town—Dineafaw, Pen Dinis.
Dol, a meadow—Dolwilym, Dolau.
Duer, Dwyf, water—Glyndwrdu, the patrimony of the celebrated Owen Glendower, of which his Anglicized name is a corruption.
Eglwys, a corruption of the Latin "ecclesia," a church—Eglwysyrw, Tanfrogynlws.
Gaff, in North Wales a steep slope; in South Wales a hanging wall—Gawf-yrhyd, Pen-y-rhyd, Glynhaf.
Gelli, a grove—Gellideg, Pengelly Forest.
Glan, a bank—Glanmyr, Glandafan.
Glyn, a glen or narrow valley—Glyncothi, Tyglwyn.
Llafur, a labourer—Llafur, Afon Llafur.
Llwyd, a grove—Penlyn, Llwybran.
Lyny, a court or palace—Henlly, Llsywenn.
Maes, open land, or battlede—Maesfyl (the Welsh name for Radnorshire), Maesilwch.
Moel, a hill, hence a bare hill-top—Mocrief.
Mfr, the sea—Brynmor, Glanymor.
Mynydd, mountain—Llanyfyl, Mynydd Dd.
Nant, a ravine, hence also a brook—Nantglywyll, Nannau, Nantgaredig.
Pant, a glen or hollow—Pantycelyn, Blaencpen.
Parc, an enclosed field—Parc-y-marw, Penparc.
Paw, a sp Tanner, ancient name—Pwllgan, Glamorgan.
Pont, a bridge, a corruption of the Latin "pons"—Ponthirwen, Talbytont.
Porth, a gate or harbour—perhaps a corrupt form of the Latin "porta"—Aberporth, Pump Porth ("the Five Gates").
Rhiau, ascent or slope—Troyedriw, Rhiau.
Rhos, a moor—Rhlosinlyn, Typhros.
Rhyd, a ford—Rhyd-y-cwm, Glynhaf.
Sarn, a causeway, generally descriptive of the old Roman pavel roads—Talsarn, Sarnau, Sarn Badrig.
Tal, an end, also head—Taliaris, Talilym.
Ty, a homestead, hence caufer, a hundred—Hendref, Caerfrynwy, gwaedol.
Toed, a base—Toed-y-bryn.
Ty, a house, a cottage—Tywynwyd, Mynachwy.
Wl, or gwyn, the Celtic word for water, preserved in the names of many Welsh rivers—Elwy, Gwili, Wye or Gwy.
Ynys, an island, or hill in the midst of a bog—Ynys Enlli (the Welsh name for Bardsey Islands), Ynysgil, Glynynys.
Ysbyty, spire, a corrupt form of the Latin "hospitalium," often used of the guest-house of an abbey—Ysbyty Ystwyth, Tafarn Spite.
Ystrad, a meadow or rich lowland—Ystrad Mynach, Llanhangel Ystrad.

Population.—The total population of the twelve counties of the Principality was: 1,360,513 (1881), 1,419,058 (1891), 1,206,600 (1901). These figures prove a steady increase of some magnitude, but the increase itself is confined entirely to the industrial districts of the Principality, and in a special degree to Glamorgan-shire; while the agricultural counties, such as Pembroke, Merioneth, Cardigan or Montgomery, present a continuous though slight decrease owing to local emigration to the centres of industry. The whole population of Wales in Tudor, Stuart and early Georgian times can scarcely have exceeded 500,000 souls, and was probably less. But with the systematic development of the vast mineral resources in the South Wales coalfield, the population of Glamorganshire has increased at a more rapid rate than that of any other county of the United Kingdom, so that at present this county contains about half the population of all Wales. It will be noted, therefore, that the vast mass of the inhabitants of Wales are settled in the industrial area which covers the northern districts of Glamorganshire and the southeastern corner of Carmarthenshire; whilst central Wales, comprising the four counties of Cardigan, Radnor, Merioneth and Montgomery, forms the least populous portion of the Principality. The coal mining districts, at present, contain a population exceeding 10,000: Cardiff, Ystradysod, Swansea, Merthyr Tydfil, Abergavenny, Pontypool, Llanelli, Ogmore and Garw, Pembroke, Caerphilly, Maesteg, Wrexham, Penarth, Neath, Ffestiniog, Bangor, Holyhead, Carmarthen. Only four towns in North Wales are included in these eighteen, and the combined population of these four—Wrexham (14,666), Ffestiniog (11,435), Bangor (11,260) and Holyhead (10,979)—fall far below that of Merthyr Tydfil (60,228), the fourth largest town in Glamorganshire.

Industries.—The chief mineral product of the Principality is coal, of which about 50,000,000 tons are annually exported. The great South Wales coalfield, one of the largest in the kingdom, covers the greater part of Monmouthshire and Glamorganshire, the southeastern corner of Carmarthenshire, and a small portion of south Pembrokeshire, and the quality of its coal is especially suitable for smelting purposes and for use in steamships. The supply of limestone and ironstone in Glamorganshire is said to be practically unexhausted, and tons of pig iron and steel, and some of the largest iron-works in the world are situated at Merthyr Tydfil and Dowlais. Copper, tin and lead works are everywhere numerous in the busy valleys of north Glamorgan and in the neighboring mining counties of Swansea and Llanelli. In North Wales, Wrexham, Ruabon and Chirk are centres of coal-mining industry. There are valuable copper mines in Anglesea, and lead mines in Flint and in north Cardiganshire, which also yield a certain deposit of silver ore. Gold has been discovered and worked, though only to a small extent, in Merionethshire and Carmarthenshire. Slate quarries are very numerous throughout the Principality, the finest quality of slate being obtained in the neighbourhood of Bangor and Carnarvon, where the Penrhyn and Bethesda quarries give employment to many thousands of workmen.

By far the larger portion of Wales is purely agricultural in character, and much of the valley land is particularly fertile, notably the Vale of Glamorgan, the Vale of Clywd and the valleys of the Towy, the Teifi, the Usk and the Wye, which have long been celebrated for their rich pastures. The holdings throughout Wales are for the most part smaller in extent than the average farms of England. Stock-raising is generally preferred to the growing of cereals, and in western Wales the oat crops exceed in size those of wheat and barley. The extensive tracts of unenclosed and often uninparimiable land, stock and the similarity of the Welsh, the wool of the sheep is manufactured into flannel at numberless factories in the various country towns, and the supply meets an important demand. The Welsh cattle also afford a large number of cows and ponies, which obtain high prices at the local fairs, and Pembrokeshire and Cardiganshire have long been famous for their breed of horses and ponies. The cattle of Wales present a variety of races, the Hereford breed prevailing in the eastern counties, and Shorthorns and the black Castlemartins in the southwestern parts. The great herds of goats, which in medieval times were numerous on the Welsh hills, have entirely disappeared since the general adoption of the sheep-farming industry.
The deep-sea fisheries on the south-western coasts are of some importance; the Mumbles, Tenby and Milford Haven being the chief centres. Lobsters, langoustines, mussels and oysters are caught off Cardigan Bay, and oysters are found at various points of the Pembrokeshire coast. The large rivers produce salmon, which are usually caught to the great satisfaction of the inhabitants, the byęs belonging definitely either to "Church" or "Chapel." According to the above report, the three most powerful dissenting bodies in Wales are the Congregationalists or Independents, whose members number 175,147 throughout Wales and Monmouthshire; the Calvinistic Methodists—a direct offshoot of the Church since the schism of 1811—with a membership of 176,617; and the Baptists, 143,853. Wesleyan and Presbyterian chapels are likewise numerous, and the Unitarian or Socinian body has long been powerful in the valley of the Telf. Nearly every existing sect is represented in Wales, including Swedensborgians and Moravians. The Roman Catholic Church has many followers amongst the labouring population of Irish descent in the industrial districts. The diocese of Newport (known till 1869 as Newport and Menevia) consists of the counties of Monmouth, Glamorgan and Hereford; whilst the remaining eleven counties were in 1895 formed into the Vicariate of Wales, which in 1898 was erected into a diocese under a bishop with the title of Menevia. Since the expulsion of the religious orders from France in 1903 several communities of French monks and nuns have taken up their abode in the Principality.

History.—At the time of the Roman invasion of Britain, 55 A.D., the west is marked out as the seat of the Ictinians, a nation of the north and west of the Severn, viz. the Decani, owning the island of Anglesea (Ynys Fôn) and the Snowdonian district; the Ordovices, inhabiting the modern counties of Denbigh, Flint and Montgomery; the Dimetae, in the counties of Cardigan, Carmarthen and Pembroke; and the Silures, occupying the counties of Glamorgan, Brecknock, Radnor and Monmouth. It is interesting to note that the existing four Welsh sees of Bangor, St Asaph, St Davids and Llandaff correspond in the main with the limits of these four tribal divisions. On the advance of Ostrogoths into western Britain, he met with considerable resistance from Caractacus (Caradog), king of the Silures, but after some encounters this prince was eventually captured and sent in chains to Rome. The partial conquest by Ostrogoths was completed under Julius Frontinus by the year 78, after which the Romans set to work in order to pacify and develop their newly annexed territory. At this period the copper mines of Mona or Anglesea, the silver mines near Plinlimmon and the gold mines in the valley of the Cothi in Carmarthenshire were exploited and worked with some success by the conquerors. In spite of the mountainous and boggy character of the country, the Romans were now constructing the many great Roman roads of which the most important are the military road leading S. from Deva (Chester) by way of Uriconium (Wroxeter) and Gobannium (Abergevenny) to Isca Silurum (Caerleon-on-Usk) and Venta Silurum (Caerwent); another from Deva to Conovium (Conway), whence a road, the Sarn Helen, extended due S. to Carmarthen (Mari- dumum), by way of Loventium (Pont Llanio), which was also connected with Gobannium; from Maridumum a road led E. through the modern county of Glamorgan by way of Lucarum (Loughor) and Nidum (Neath) to Venta Silurum. With the mission of Constantine to Christianity was introduced by the Romans into the peninsula Wales already colonised, and the efforts of the Roman priests were later supplemented during the 5th, 6th and 7th centuries by the devoted labours of Celtic missionaries, of whom nearly five hundred names still remain on record. Foremost in the work of preaching and educating were SS. David, Tilo, Illtyd and Cadoc in Dyfed, Morganwg, Gwent and Brycheiniog, comprising South Wales; Cyndol, Alan and Padarn in Ceredigion and Maesfelin, or Mid-Wales; and Deiniol, Dunawd, Beuno, Kentigern and Asaph in North Wales. To this period succeeding the fall of the Roman power is also assigned the foundation of the priories of which Bangor-Iscod on the Dee, Bardsey Island, Llanharn and Llantwit Major in the Vale of Glamorgan, Caerleon-on-Uk
and St Davids are amongst the most celebrated in early Welsh ecclesiastical annals. With the withdrawal of the Roman legions, the recognized powers of the Dux Britanniarum, the Roman official who governed the upper province of Britain, were in the 5th century assumed by the Celtic prince Cunedda under the title of Gwledig (the supreme), who fixed his court and residence at Degavney, near the modern Llandinno. During the 6th century the battle of Deorham gained by the West Saxons in 577 cut off communication with Cornwall, and in 613 the great battle of Chester, won by King Ethelfrith, prevented the descendants of Cunedda from ever again asserting their sovereignty over Strathclyde; the joint effect, therefore, of these two important Saxon victories was to isolate Wales and at the same time to put an end to all pretensions of its rulers as the inheritors of the ancient political claims of the Roman governors of the northern province of Britain. The 8th century saw a further curtailment of the Welsh territories under Offa, King of Mercia, who annexed Shrewsbury (Amwythig) and Hereford (Henfordd) with their surrounding districts, and constructed the artificial boundary known as Offa's Dyke running due N. and S. from the mouth of the Dee to that of the Wye. It was during these disastrous Mercian wars that there first appeared on the Welsh coasts the Norse and Danish pirates, who harried and burnt the small towns and flourishing monasteries on the shores of Cardigan Bay and the Bristol Channel. In the 9th century, however, the Welsh, attacked by land and sea, by Saxons and by Danes, at length obtained a prince capable of bringing the turbulent chieftains of his country into obedience, and of opposing the two sets of invaders of his realm. This was Rhodri Mawr, or Roderick the Great, a name always cherished in Cymric annals. Like Alfred of Wessex, Rhodri also built a fleet in order to protect Anglesea, "the mother of Wales," so called on account of its extensive cornfields which supplied barren Gwynedd with provisions. In 877 Rhodri, after many vicissitudes, was slain in battle, and his dominions of Gwynedd (North Wales), Deheubarth (South Wales) and Powys (Mid Wales) were divided amongst his three sons, Anarawd, Cadell and Mervyn. Consolidation of Cambro-British territory was found impossible; there was no settled capital; and the three princes fixed their courts respectively at Aberfraw in Anglesea, at Dynevor (Dinefawr) near Llandilo in Deheubarth, and at Mathrafal in Powys. Howel, son of Cadell, commonly known as Howel Dda the Good, is ever celebrated in Welsh history as the frame, or rather the codifier, of the ancient laws of his country, which were promulgated to the people at his hunting lodge, Ty Gwyn ar Taf, near the modern Whitland. In Howel's code the prince of Gwynedd was absolute in his own lands and dominions, but in other lands was subject to the authority of his overlord. Howel was killed in battle near Dynevor, the kingdom to which his grandson was destined to complete. On the other hand, "The Lord Rhys," as he is usually termed, did homage to Henry II. at Pembroke in 1171, and was appointed the royal justiciar of all South Wales. At the castle of Cardigan in 1176, Prince Rhys held a historic bardic entertainment, or eisteddfod, wherein the poets and harpists of Gwynedd and Deheubarth contended in amicable rivalry. This enlightened prince died in 1196, and as at his death the house of Dynevor ceased to be of any further political importance, the overlordship of all Wales became vested indisputably in the house of Gwynedd, which from this point onwards may be considered as representing in itself alone the independent principality of Wales. The prince of Gwynedd henceforth considered himself as a sovereign, independent, but owing a personal allegiance to the king of England, and it was to obtain a recognition of his rights as such that Llewelyn ap Iorwerth, "the Great," consistently strove under three English kings, and though his resources were small, it seemed for a time as though he might be able by uniting his countrymen to place the recognized autonomy of Gwynedd on a firm and enduring basis. By first connecting himself with John through a marriage with the English king's daugther, and by straining every nerve to repress dissensions and enforce obedience amongst the Welsh chieftains, and later by alloying himself with the English barons against his suzerain, this prince during a
The reign of 44 years was enabled to give a considerable amount of peace and prosperity to his country, which he persistently sought to rule as an independent sovereign, although acknowledging a personal vassalage to the king of England.
